GENERAL NOTICES

General Notices

General Statements

The General Notices provide the basic guidelines for the interpretation and application of the standards, tests, assays, and other specifications of the Indian Pharmacopoeia (IP), as well as to the statements made in the monographs and other texts of the Pharmacopoeia.

A monograph is to be constructed in accordance with any general monograph or notice or any appendix, note or other explanatory material that is contained in this Pharmacopoeia and that is applicable to that monograph. All statements contained in the monograph, except where a specific general notice indicates otherwise and with the exceptions given hereafter, constitute standards for the official articles. An article is not of pharmacopoeial quality unless it complies with all of the requirements stated.

Exceptions to the General Notices do exist, and where they do, the wording in the individual monograph or an appendix takes precedence and specifically indicates directions or the intent. Thus, the specific wording of standards, tests, assays and other specifications is binding wherever deviations from the General Notices exist. Likewise, where there is no specific mention to the contrary, the General Notices apply.

Name. The full name or title of this book, including addenda thereto, is Indian Pharmacopoeia 2010, abbreviated to IP 2010. In the texts, the term "Pharmacopoeia" or "IP" without qualification means the Indian Pharmacopoeia 2010 and any addenda thereto.

Official and Official Articles. The word 'official' wherever used in this Pharmacopoeia or with reference thereto, is synonymous with 'pharmacopoeial', with 'IP' and with 'compendial'. The designation IP in conjunction with the official title on the label of an article is an indication that the article purports to comply with IP standards.

The following terms are used where the articles for which monographs are provided are to be distinguished.

An official substance is a single drug or a drug entity or a pharmaceutical aid for which the monograph title includes no indication of the nature of a dosage form.

An official preparation is a drug product (dosage form) and is the finished or partially finished preparation or product of one or more official substances formulated for use on the patient.

An article is an item for which a monograph is provided, whether an official substance or an official preparation.

Official Standards. The requirements stated in the monographs apply to articles that are intended for medicinal use but not necessarily to articles that may be sold under the same name for other purposes.

The active pharmaceutical ingredients (drug substances), excipients (pharmaceutical aids), pharmaceutical preparations (dosage forms) and other articles described in the monographs are intended for human and veterinary use (unless explicitly restricted to one of these uses).

The requirements given in the monographs are not framed to provide against all possible impurities, contaminants or adulterants; they provide appropriate limitation of potential impurities only.

A preparation must comply throughout the shelf-life assigned to it by the manufacturer; for opened or broached containers the maximum period of validity for use may sometimes be stated in the individual monograph. Nevertheless, the responsibility for assigning the period of validity shall be with the manufacturer.

Added Substances. An official substance, as distinguished from an official preparation, contains no added substances except when specifically permitted in the individual monograph. Unless otherwise specified in the individual monograph, or elsewhere in the General Notices, suitable substances may be added to an official preparation to enhance its stability, usefulness or elegance, or to facilitate its preparation. Such auxiliary substances shall be harmless in the amounts used, shall not exceed the minimum quantity required to provide their intended effect, shall not impair the therapeutic efficacy or the bioavailability or safety of the preparation and shall not interfere with the tests and assays prescribed for determining compliance with the official standards. Particular care should be taken to ensure that such substances are free from harmful organisms. The freedom to the manufacturers to add auxiliary substances imposes on them the responsibility of satisfying the licensing authorities on the purpose of the addition and the innocuity of such substances.

Alternative Methods. The tests and assays described are the official methods upon which the standards of the Pharmacopoeia are based. Alternative methods of analysis may be used for control purposes, provided that the methods used are shown to give results of equivalent accuracy and enable an unequivocal decision to be made as to whether compliance with the standards of the monographs would be achieved if the official methods were used. Automated procedures utilising the same basic chemistry as the test procedures given in the monograph may also be used to determine compliance. Such alternative or automated procedures must be validated.

In the event of doubt or dispute, the methods of analysis of the Pharmacopoeia are alone authoritative and only the result obtained by the procedure given in this Pharmacopoeia is conclusive.

Meanings of Terms

Alcohol. The term "alcohol" without qualification means ethanol (95 per cent). Other dilutions of ethanol are indicated by the term "ethanol" or "alcohol" followed by a statement of the percentage by volume of ethanol (C_2H_6O) required.

Desiccator. A tightly-closed container of suitable size and design that maintains an atmosphere of low moisture content by means of silica gel or phosphorus pentoxide or other suitable desiccant.

Drying and ignition to constant weight. Two consecutive weighings after the drying or igniting operations do not differ by more than 0.5 mg, the second weighing following an additional period of drying or of ignition respectively appropriate to the nature and quantity of the residue.

Ethanol. The term "ethanol" without qualification means anhydrous ethanol or absolute alcohol.

Filtration. Unless otherwise stated, filtration is the passing of a liquid through a suitable filter paper or equivalent device until the filtrate is clear.

Freshly prepared. Made not more than 24 hours before it is issued for use.

Label. Any printed packing material, including package inserts that provide information on the article.

Negligible. A quantity not exceeding 0.50 mg.

Solution. Where the name of the solvent is not stated, "solution" implies a solution in water. The water used complies with the requirements of the monograph on Purified Water. The term 'distilled water' indicates Purified Water prepared by distillation.

Temperature. The symbol ° used without qualification indicates the use of the Celsius thermometric scale.

Water. If the term is used without qualification it means Purified Water of the Pharmacopoeia. The term 'distilled water' indicates Purified Water prepared by distillation.

Water-bath. A bath of boiling water unless water at another temperature is indicated. Other methods of heating may be used provided the required temperature is approximately maintained but not exceeded.

Provisions Applicable to Monographs and Test Methods

Expression of Contents. Where the content of a substance is defined, the expression "per cent" is used according to circumstances with one of two meanings:

— per cent w/w (percentage, weight in weight) expressing the number of grams of substance in 100 grams of final product,

— per cent v/v (percentage, volume in volume) expressing the number of millilitres of substance in 100 millilitres of final product.

The expression "parts per million" refers to the weight in weight, unless otherwise stated.

Where the content of a substance is expressed in terms of the chemical formula for that substance an upper limit exceeding 100 per cent may be stated. Such an upper limit applies to the result of the assay calculated in terms of the equivalent content of the specified chemical formula. For example, the statement 'contains not less than 99.0 per cent and not more than 101.0 per cent of $C_7H_6O_2$ implies that the result of the assay is not less than 99.0 per cent and not more than 101.0 per cent, calculated in terms of the equivalent content of $C_7H_6O_2$.

Where the result of an assay or test is required to be calculated with reference to the dried, anhydrous, ignited substance, or the substance free from solvent, the determination of loss on drying, water content, loss on ignition, content of the specified solvent, respectively is carried out by the method prescribed in the relevant test in the monograph.

Expression of Concentrations. The following expressions in addition to the ones given under Expression of Content are also used:

— per cent w/v (percentage, weight in volume) expressing the number of grams of substance in 100 millilitres of product

— per cent v/w (percentage, volume in weight) expressing the number of millilitres of substance in 100 grams of product.

Usually, the strength of solutions of solids in liquids is expressed as percentage weight in volume, of liquids in liquids as percentage volume in volume, of solids in semi-solid bases (e.g. creams) and of gases in liquids as percentage weight in weight.

When the concentration of a solution is expressed as parts of dissolved substance in parts of solution, it means parts by weight (g) of a solid in parts by volume (ml) of the final solution; as parts by weight (g) of a gas in parts by weight (g) of the final solution.

When the concentration of a solution is expressed in molarity designated by the symbol M preceded by a number, it denotes the number of moles of the stated solute contained in sufficient Purified Water (unless otherwise stated) to produce 1 litre of solution.

Abbreviated Statements. Incomplete sentences are employed in parts of the monographs for directness and brevity (for example, Iodine Value. Not more than .....; Relative Density. .....to.....) Where the tests are abbreviated, it is to be understood that the test method referred to in brackets

provides the method to be followed and that the values specified are the applicable limits.

Weights and Measures. The metric system of weights and measures is employed in the Pharmacopoeia. All measures are required to be graduated at 25° and all measurements in tests and assays, unless otherwise stated, are to be made at that temperature. Graduated glass apparatus used in analytical operations shall comply with the requirements stated in Chapter 2.1.6

Monographs

General Monographs

General monographs on dosage forms include requirements of general application and apply to all preparations within the scope of the Introduction section of the general monograph, except where a preamble limits the application. The requirements are not necessarily comprehensive for a given specific preparation; additional requirements may sometimes be given in the individual monograph for it.

Production. Statements given under the heading Production relate to particular aspects of the manufacturing process and are not necessarily comprehensive. However, they are mandatory instructions to manufacturers. They may relate, for example, to source materials, to the manufacturing process and its validation and control, to any in-process testing that is to be carried out by the manufacturer on the final product either on selected batches or on each batch prior to release. All this cannot be verified on a sample of the final product by an independent analyst. It is for the licensing authority to verify that the instructions have been followed.

The absence of a section on Production does not imply that attention to features such as those given above is not required. An article described in a monograph of the Pharmacopoeia is to be manufactured in accordance with the principles of good manufacturing practice and in accordance with the requirements of the Drugs and Cosmetics Rules, 1945. The general principles applicable to the manufacture and quality assurance of drugs and preparations meant for human use apply equally to veterinary products as well.

Manufacture of Drug Products. The opening definitive statement in certain monographs for drug products is given in terms of the active ingredient(s) only. Any ingredient(s) other than those included in the statement, must comply with the general notice on Excipients and the product must conform to the Pharmacopoeial requirements.

Official preparations are prepared only from ingredients that comply with the requirements of the pharmacopoeial monographs for those individual ingredients for which monographs are provided.

Excipients. Any substance added in preparing an official preparation shall be innocuous, shall have no adverse influence in the therapeutic efficacy of the active ingredients and shall not interfere with the tests and assays of the Pharmacopoeia. Care should be taken to ensure that such substances are free from harmful organisms.

Individual Monographs

Drug products that are the subject of an individual monograph are also required to comply with the tests given in the general monographs.

Titles. The main title for a drug substance is the International Non-proprietary Name (INN) approved by the World Health Organization. Subsidiary names and synonyms have also been given in some cases; where included, they have the same significance as the main title.

The main titles of drug products are the ones commonly recognised in practice. Synonyms drawn from the full non-proprietary name of the active ingredient or ingredients have also been given. Where, however, a product contains one or the other of different salts of an active molecule, the main title is based on the full name of the active ingredient. For example, Chloroquine Phosphate Tablets and Chloroquine SulphateTablets.

Chemical Formulae. When the chemical structure of an official substance is known or generally accepted, the graphic and molecular formulae are normally given at the beginning of the monograph for information. This information refers to the chemically pure substance and is not to be regarded as an indication of the purity of the official material. Elsewhere, in statement of purity and strength and in descriptions of processes of assay, it will be evident from the context that the formulae denote the chemically pure substances.

Where the absolute stereochemical configuration is specified, the International Union of Pure and Applied Chemistry (IUPAC) *R/S* and *E/Z* systems of designation have been used. If the substance is an enantiomer of unknown absolute stereochemistry, the sign of the optical rotation, as determined in the solvent and under the conditions specified in the monograph, has been attached to the systematic name. An indication of sign of rotation has also been given where this is incorporated in a trivial name that appears on an IUPAC preferred list.

Atomic and Molecular Weights. The atomic weight or molecular weight is shown , as and when appropriate at the top right hand corner of the monograph. The atomic and molecular weights and graphic formulae do not constitute analytical standards for the substances described.

Definition. The opening statement of a monograph is one that constitutes an official definition of the substance, preparation or other article that is the subject of the

monograph. In certain monographs for pharmaceutical preparations the statement is given in terms of the principal ingredient(s).

In monographs on vegetable drugs, the definition indicates whether the subject of the monograph is, for example, the whole drug or the drug in powdered form.

Certain pharmaceutical substances and other articles are defined by reference to a particular method of manufacture. A statement that a substance or article is prepared or obtained by a certain method constitutes part of the official definition and implies that other methods are not permitted. A statement that a substance may be prepared or obtained by a certain method, however, indicates that this is one possible method and does not imply that other methods are not permissible.

Statement of content. The limits of content stated are those determined by the method described under Assay.

Category. The statement of category is provided for information and is indicative of the medical or pharmaceutical basis for recognition in the Pharmacopoeia. It generally represents an application of the best known pharmacological action of the article or of its active ingredient. In the case of pharmaceutical aids it may indicate the more common usage of the article. The statement is not intended to limit in any way the choice or use of the article nor to indicate that it has no other activity or use.

Dose. Doses mentioned in the Pharmacopoeia are intended merely for general guidance and represent, unless otherwise stated, the average range of quantities which are generally regarded as suitable for adults when administered by mouth. They are not to be regarded as binding upon the prescribers. The medical practitioner will exercise his own judgment and act on his own responsibility in respect of the amount of any therapeutic agent he may prescribe or administer or the frequency of its administration. If it is usual to administer a drug by a method other than by mouth, the single dose suitable for that method of administration is mentioned. In the case of some preparations notes have been given below the statement of doses to show the approximate quantities of active ingredients contained in the maximal doses as information for the prescriber.

Usual Strength. The statement on the usual strength(s) of a preparation given in the individual monograph indicates the strength(s) usually marketed for information of the pharmacist and the medical practitioner. It does not imply that a strength other than the one(s) mentioned in the individual monograph meeting all the prescribed requirements cannot be manufactured and marketed with the approval of the appropriate authority.

Description. The statements under the heading Description are not to be interpreted in a strict sense and are not to be regarded as official requirements.

Solubility. Statements on solubility are given in Chapter 2.4.26 and are intended as information on the approximate solubility at a temperature between 15° and 30°, unless otherwise stated, and are not to be considered as official requirements. However, a test for solubility stated in a monograph constitutes part of the standards for the substance that is the subject of that monograph.

Test Methods

References to general methods of testing are indicated by test method numbers in brackets immediately after the heading of the test or at the end of the text.

Identification. The tests given under the heading Identification are not necessarily sufficient to establish absolute proof of identity. They provide a means of verifying that the identity of the material under examination is in accordance with the label on the container.

In certain monographs alternative series of identification tests are given; compliance with either one or the other set of tests is adequate to verify the identity of the article.

When tests for infrared absorption are applied to material extracted from formulated preparations, strict concordance with the specified reference spectrum may not always be possible, but nevertheless a close resemblance between the spectrum of the extracted material and the specified reference spectrum should be achieved.

Tests and Assays

The tests and assays are the official methods upon which the standards of the Pharmacopoeia depend. The requirements are not framed to take into account all possible impurities. It is not to be presumed, for example, that an impurity that is not detectable by means of the prescribed tests is tolerated. Material found to contain such an impurity is not of pharmacopoeial quality if the nature or amount of the impurity found is incompatible with good pharmaceutical practice.

Pharmacopoeial methods and limits should be used merely as compliance requirements and not as requirements to guarantee total quality assurance. Tests and assays are prescribed for the minimum sample available on which the attributes of the article should be measured. Assurance of quality must be ensured by the manufacturer by the use of statistically valid sampling and testing programmes.

Tests. Unless otherwise stated, the assays and tests are carried out at a temperature between 20° and 30°.

Where it is directed that an analytical operation is to be carried out 'in subdued light', precautions should be taken to avoid exposure to direct sunlight or other strong light. Where a procedure is directed to be performed 'protected from light' precautions should be taken to exclude actinic light by the

use of low-actinic glassware, working in a dark room or similar procedures.

For preparations other than those of fixed strength, the quantity to be taken for a test or an assay is usually expressed in terms of the active ingredient. This means that the quantity of the active ingredient expected to be present and the quantity of the preparation to be taken are calculated from the strength stated on the label.

Other Tests. In the monographs on dosage forms and certain preparations, under the sub-heading 'Other tests' it is stated that the article complies with the tests stated under the general monograph of the relevant dosage form or preparation. Details of such tests are provided in the general monographs.

Limits. The limits given are based on data obtained in normal analytical practice. They take into account normal analytical errors, of acceptable variations in manufacture and of deterioration to an extent that is acceptable. No further tolerances are to be applied to the limits for determining whether or not the article under examination complies with the requirements of the monograph.

Quantities. Unless otherwise stated, the quantities to be taken for assays, limit tests and other tests are of the substance under examination.

In tests with numerical limits and assays, the quantity stated to be taken for testing is approximate. The amount actually used, which may deviate by not more than 10 per cent from that stated, is accurately weighed or measured and the result of analysis is calculated from this exact quantity. In tests where the limit is not numerical but usually depends upon comparison with the behaviour of a reference in the same conditions, the stated quantity is taken for testing. Reagents are used in the prescribed amounts.

Quantities are weighed or measured with an accuracy commensurate with the indicated degree of precision. For weighings, the precision is plus or minus 5 units after the last figure stated. For example, 0.25 g is to be interpreted as 0.245 g to 0.255 g. For the measurement of volumes, if the figure after the decimal point is a zero or ends in a zero, e.g. 10.0 ml or 0.50 ml, the volume is measured using a pipette, a volumetric flask or a burette, as appropriate; in other cases, a graduated measuring cylinder or a graduated pipette may be used. Volumes stated in microlitres are measured using a micropipette or microsyringe.

The term 'transfer' is used generally to indicate a quantitative operation.

Apparatus. Measuring and weighing devices and other apparatus are described in the chapter entitled 'Apparatus for Tests and Assays'. A specification for a definite size or type of container or apparatus in a test or assay is given merely as a recommendation.

Unless otherwise stated, comparative tests are carried out using identical tubes of colourless, transparent, neutral glass with a flat base, commonly known as Nessler cylinders.

Reagents and Solutions. The reagents required for the tests and assays of the Pharmacopoeia are defined in the various chapters showing their nature, degree of purity and the strengths of the solutions to be made from them. The requirements set out are not intended to imply that the materials are suitable for use in medicine; reagents not covered by monographs in the pharmacopoeia shall not be claimed to be of IP quality.

The term 'analytical reagent grade of commerce' implies that the chemical is of a high degree of purity wherein the limits of various impurities are known. Where it is directed to use a 'general laboratory reagent grade of commerce' it is intended that a chemically pure grade material, not necessarily required to be tested for limiting or absence of certain impurities, is to be used.

Indicators. Where the use of an indicator solution is mentioned in an assay or test, approximately 0.1 ml of the solution shall be added, unless otherwise directed.

Reference Substances. Certain monographs require the use of a chemical reference substance or a biological reference preparation or a reference spectrum These are authentic specimens chosen and verified on the basis of their suitability for intended use as prescribed in the Pharmacopoeia and are not necessarily suitable in other circumstances.

IP Reference Substances, abbreviated to IPRS (and referred to as RS in the individual monographs) are issued by the Indian Pharmacopoeia Commission (IPC). They are the official standards to be used in cases of arbitration. Secondary Standards (Working Standards) may be used for routine analysis, provided they are standardized at regular intervals against the Reference Substances

Biological Reference Substances, also abbreviated to IPRS and Standard Preparations of antibiotics are issued by agencies authorised by the IPC. They are standardized against the International Standards and Reference Preparations established by the World Health Organization (WHO). The potency of these preparations is expressed in International Units.

Reference spectra are published by the IPC and they are accompanied by information concerning the conditions used for sample preparation and recording of the spectra.

Test Animals. Unless otherwise directed, animals used in a test or an assay shall be healthy and are drawn from a uniform stock, and have not previously been treated with any material that will interfere with the test or the assay.

Calculation of Results. In determining compliance with a numerical limit in assay or test, the result should be calculated

to one decimal place more than the significant figures stated and then rounded up or down as follows: if the last figure calculated is 5 to 9, the preceding figure is increased by 1; if it is 4 or less, the preceding figure is left unchanged.

Storage. Statements under the side-heading Storage constitute non-mandatory advice. The articles of the Pharmacopoeia are to be stored under conditions that prevent contamination and, as far as possible, deterioration. Precautions that should be taken in relation to the effects of the atmosphere, moisture, heat and light are indicated, where appropriate, in the individual monograph.

Specific directions are given in some monographs with respect to the temperatures at which Pharmacopoeial articles should be stored, where it is considered that usage at a lower or higher temperature may produce undesirable results. The storage conditions are defined by the following terms:

— Store in a dry, well ventilated place at a temperature not exceeding 30°

— Store in a refrigerator (2° to 8°). Do not freeze

— Store in a freezer (-2° to -18°)

— Store in a deep freezer (Below -18°)

Storage conditions not related to temperature are indicated in the following terms:

— Store protected from light

— Store protected from light and moisture

Where no specific storage directions or limitations are given in the monograph or by the manufacturer, it is to be understood that the storage conditions include protection from moisture, freezing and excessive heat (any temperature above 40°).

Storage Containers. The requirements, guidance and information on containers for pharmaceutical use are given in the chapter entitled Containers (6.1)

In general, an article should be packed in a well-closed container i.e. one that protects the contents from contamination by extraneous solids, liquids or vapours and from loss of the article under normal conditions of handling and storage.

Where, additionally, loss or deterioration of the article from effervescence, deliquescence or evaporation under normal conditions of storage is likely, the container must be capable of being tightly closed, and re-closed after use.

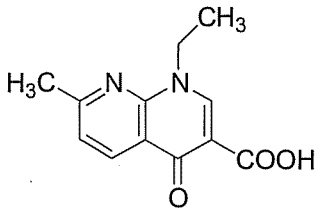
In certain cases, special requirements of pack have been indicated in some monographs under Storage, using expressions that have been defined in chapter 6.1.

Labelling. The labelling of drugs and pharmaceuticals is governed by the Drugs and Cosmetics Rules, 1945. The statements that are given in the monographs under the side-heading 'Labelling' are not comprehensive. Only those that are necessary to demonstrate compliance or otherwise with the monograph have been given and they are mandatory. For example, in the monograph on Betamethasone Sodium Tablets the labelling statement is "The label states the strength in terms of the equivalent amount of betamethasone". Any other statements are included as recommendations.

DRUG SUBSTANCES, DOSAGE FORMS AND PHARMACEUTICAL AIDS

N

Nalidixic Acid



$C_{12}H_{12}N_2O_3$ Mol. Wt. 232.2

Nalidixic Acid is 1-ethyl-1,4-dihydro-7-methyl-4-oxo-1,8-naphthyridine-3-carboxylic acid.

Nalidixic Acid contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{12}H_{12}N_2O_3$, calculated on the dried basis.

Category. Antibacterial.

Dose. 2 to 4 g daily, in divided doses.

Description. A white to slightly yellow, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nalidixic acid RS* or with the reference spectrum of nalidixic acid.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.0005 per cent w/v solution in *0.1 M sodium hydroxide* shows absorption maxima at about 258 nm and 334 nm; ratio of the absorbance at about 258 nm to that at about 334 nm, 2.2 to 2.4.

C. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (c).

D. Dissolve 0.1 g in 2 ml of *hydrochloric acid* and add 0.5 ml of a 10 per cent w/v solution of *2-naphthol* in *ethanol (95 per cent)*; an orange-red colour develops.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254*.

Mobile phase. A mixture of 70 volumes of *ethanol (95 per cent)*, 20 volumes of *dichloromethane* and 10 volumes of *5 M ammonia*.

Test solution (a). Dissolve 0.2 g of the substance under examination in 10 ml of *dichloromethane*.

Test solution (b). A 0.1 per cent w/v solution of the substance under examination in *dichloromethane*.

Reference solution (a). A 0.002 per cent w/v solution of the substance under examination in *dichloromethane*.

Reference solution (b). A 0.0008 per cent w/v solution of the substance under examination in *dichloromethane*.

Reference solution (c). A 0.1 per cent w/v solution of *nalidixic acid RS* in *dichloromethane*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18) Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.15 g, dissolve in 10 ml of *dichloromethane*, add 30 ml of *2-propanol* and 10 ml of *carbon dioxide-free water* and titrate with *0.1 M ethanolic sodium hydroxide*, determining the end-point potentiometrically (2.4.25) and using a glass electrode as the indicator electrode and a silver-silver chloride reference electrode with a sleeve diaphragm or a capillary tip filled with a saturated solution of *lithium chloride* in *ethanol*. Throughout the titration keep the temperature of the solution at 15° to 20° and pass a current of nitrogen through the solution.

1 ml of *0.1 M ethanolic sodium hydroxide* is equivalent to 0.02322 g of $C_{12}H_{12}N_2O_3$.

Storage. Store protected from light and moisture.

Nalidixic Acid Tablets

Nalidixic Acid Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of nalidixic acid, $C_{12}H_{12}N_2O_3$.

Usual strengths. 250 mg; 500 mg.

Identification

To a quantity of the powdered tablets containing 1 g of Nalidixic Acid add 50 ml of *chloroform*, shake for 15 minutes, filter and evaporate the filtrate to dryness. The residue, after drying at 105°, complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nalidixic acid RS* or with the reference spectrum of nalidixic acid.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.0005 per cent w/v solution in *0.1 M sodium hydroxide* shows absorption maxima at about 258 nm and 334 nm; ratio of the absorbance at about 258 nm to that at about 334 nm, 2.2 to 2.4.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254*.

Mobile phase. A mixture of 70 volumes of *ethanol (95 per cent)*, 20 volumes of *dichloromethane* and 10 volumes of *5 M ammonia*.

Test solution. Shake a quantity of the powdered tablets containing 0.1 g of Nalidixic Acid with 50 ml of *chloroform* for 15 minutes, filter, evaporate the filtrate to dryness and dissolve the residue in 5 ml of *chloroform*.

Reference solution. Dilute 1 volume of the test solution to 200 volumes with *chloroform*.

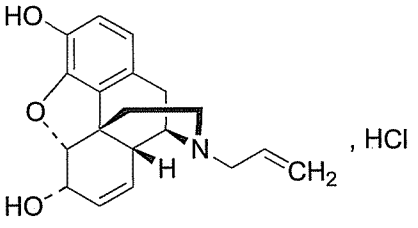
Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Other tests. Complies with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 0.1 g of Nalidixic Acid, add 150 ml of *0.1 M sodium hydroxide*, shake for 3 minutes, dilute to 200.0 ml with *0.1 M sodium hydroxide*, mix and allow to stand for 15 minutes. Dilute 2.0 ml of the solution to 100.0 ml with water and measure the absorbance of the resulting solution at the maximum at about 334 nm (2.4.7), using *0.1 M sodium hydroxide* as the blank. Calculate the content of $C_{12}H_{12}N_2O_3$ taking 494 as the specific absorbance at 334 nm.

Storage. Store protected from light and moisture.

Nalorphine Hydrochloride



$C_{19}H_{21}NO_3,HCl$ Mol. Wt. 347.8

Nalorphine Hydrochloride is 17-allyl-7,8-didehydro-4,5α-epoxymorphinan-3,6α-diol hydrochloride.

Nalorphine Hydrochloride contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{19}H_{21}NO_3,HCl$, calculated on the dried basis.

Category. Narcotic antagonist.

Dose. By intravenous injection, 5 mg, repeated twice at three minute intervals, if necessary.

Description. A white or almost white, crystalline powder; odourless. It slowly darkens on exposure to air and light.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests C and D may be omitted if tests A, B and E are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nalorphine hydrochloride RS*.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.01 per cent w/v solution in *0.1 M sodium hydroxide* shows an absorption maximum only at about 298 nm; absorbance at about 298 nm, about 0.6.

C. To 10 ml of a 2 per cent w/v solution add 0.05 ml of *dilute ammonia solution*; a white precipitate soluble in sodium hydroxide solution is produced.

D. Dissolve 2 mg in 2 ml of *water*, add 0.15 ml of *potassium ferricyanide solution* containing, in each ml, 0.05 ml of *ferric chloride solution*; a deep bluish green colour is produced immediately.

E. Gives reaction A of chlorides (2.3.1).

Tests

Melting range (2.4.21). 260° to 263°.

Acidity. Dissolve 0.2 g in 10 ml of freshly boiled and cooled *water* and titrate with *0.02 M sodium hydroxide* using *methyl red solution* as indicator; not more than 0.2 ml of *0.02 M sodium hydroxide* is required to change the colour of the solution.

Specific optical rotation (2.4.22). –122° to –125°, determined in a 2.0 per cent w/v solution.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 100° at a pressure not exceeding 0.7 kPa for 2 hours.

Assay. Weigh accurately about 25 mg and dissolve in sufficient *water* to produce 250 ml. Measure the absorbance of the resulting solution at the maximum at about 285 nm (2.4.7). Calculate the content of $C_{19}H_{21}NO_3,HCl$ from the absorbance

obtained by repeating the operation with *nalorphine hydrochloride RS* in place of the substance under examination.

Storage. Store protected from light and moisture.

Nalorphine Injection

Nalorphine Hydrochloride Injection

Nalorphine Injection is a sterile solution of Nalorphine Hydrochloride in Water for Injections containing suitable buffering agents.

Nalorphine Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nalorphine hydrochloride, $C_{19}H_{21}NO_3,HCl$.

Usual strength. 10 mg per ml.

Identification

A. To a volume containing 50 mg of Nalorphine Hydrochloride add *dilute ammonia solution* until the solution is alkaline and extract with 25 ml of a mixture of 1 volume of *ethanol (95 per cent)* and 3 volumes of *chloroform* and evaporate the extract to dryness. Dry the residue at a pressure not exceeding 2 kPa. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nalorphine hydrochloride RS*.

B. To a volume containing 0.1 g of Nalorphine Hydrochloride add 0.05 ml of *dilute ammonia solution*; a white precipitate soluble in *sodium hydroxide solution* is produced.

C. Gives reaction A of chlorides (2.3.1).

Tests

pH (2.4.24). 6.0 to 7.5.

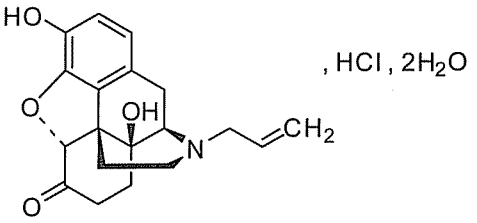
Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. Transfer an accurately measured volume containing about 10 mg of Nalorphine Hydrochloride to a separating funnel, add 1 ml of *dilute hydrochloric acid* and dilute to 10 ml with *water*. Extract with five successive quantities, each of 5 ml, of *chloroform*, allowing the layers to separate before drawing off each chloroform extract and discard the chloroform extracts. Transfer the aqueous layer to a 100-ml volumetric flask with the aid of small quantities of *water* and dilute to volume with *water*. Measure the absorbance of the resulting solution at the maximum at about 285 nm (2.4.7). Calculate the content of $C_{19}H_{21}NO_3,HCl$ from the absorbance obtained by repeating the operation with *nalorphine hydrochloride RS*.

Storage. Store protected from light.

Naloxone Hydrochloride

Naloxone Hydrochloride Dihydrate



$C_{19}H_{21}NO_4,HCl,2H_2O$ Mol. Wt. 399.9

Naloxone Hydrochloride is 17-allyl-4,5-α-epoxy-3,14-dihydroxymorphinan-3-one hydrochloride dihydrate.

Naloxone Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{19}H_{22}ClNO_4$, calculated on the anhydrous basis.

Category. Antidote for opioids poisoning.

Description. A white to almost white, hygroscopic, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Test B may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6).Compare the spectrum with that obtained with *naloxone hydrochloride dihydrate RS* or with the reference spectrum of naloxone hydrochloride.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. Mix 5 volumes of *methanol* and 95 volumes of the upper layer from a mixture of 60 ml of *ammonia* and 100 ml of *butan-1-ol*.

Test solution. Dissolve 8 mg of the substance under examination in 0.5 ml of *water* and dilute to 1 ml with *methanol*.

Reference solution. Dissolve 8 mg of *naloxone hydrochloride dihydrate RS* in 0.5 ml of *water* and dilute to 1 ml with *methanol*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 8 cm. Dry the plate in air and spray with a freshly prepared 0.5 per cent w/v solution of *potassium ferricyanide* in *ferric chloride solution* and examine in daylight. The

principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

C. Gives reaction A of chlorides (2.3.1).

Tests

Appearance of solution. A 2.0 per cent w/v solution in *carbon dioxide-free water* (Solution A) is clear (2.4.1) and colourless (2.4.1).

Acidity or alkalinity. To 10 ml of solution A add 0.05 ml of *methyl red solution.* Not more than 0.2 ml of *0.02 M sodium hydroxide* or *0.02 M hydrochloric acid* is required to change the colour of the indicator.

Specific optical rotation (2.4.22). −170° to −181°, determined in solution A.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.125 g of the substance under examination in 25 ml of *0.1 M hydrochloric acid.*

Reference solution (a). Dissolve 5 mg of *naloxone for peak identification RS* (containing naloxone impurity A (4,5α-epoxy-3,14-dihydroxymorphinan-6-one) (noroxymorphone), naloxone impurity B (4,5α-epoxy-14-hydroxy-17-(prop-2-enyl)-3-(prop-2-enyloxy)morphinan-6-one) (3-*O*-allylnaloxone), naloxone impurity C (4,5α-epoxy-3,10á,14-trihydroxy-17-(prop-2-enyl)morphinan-6-one) (10α-hydroxynaloxone), naloxone impurity D (7,8-didehydro-4,5α-epoxy-3,14-dihydroxy-17-(prop-2-enyl)morphinan-6-one) (7,8-didehydronaloxone), naloxone impurity E (4,5 α:4',5' α-diepoxy-3,3',14,14'-tetrahydroxy-17,17'-bis(prop-2-enyl)-2,2'-bimorphinanyl-6,6'-dione) (2,2'-bisnaloxone) and naloxone impurity F (4,5α-epoxy-3,10β,14-trihydroxy-17-(prop-2-enyl)morphinan-6-one) (10α-hydroxynaloxone) in 1 ml of *0.1 M hydrochloric acid.*

Reference solution (b). Dilute 1.0 ml of the test solution to 20 ml with *0.1 M hydrochloric acid.* Dilute 1.0 ml of this solution to 25.0 ml with *0.1 M hydrochloric acid.*

Chromatographic system

- a stainless steel column 12.5 cm x 4 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature. 40°,
- mobile phase: A. a mixture of 20 volumes of *acetonitrile*, 40 volumes of *tetrahydrofuran* and 940 volumes of the solution prepared by dissolving 1.1 g of *sodium octanesulphonate* in 1000 ml of *water.* Adjust to pH 2.0 with a 50 per cent v/v solution of *orthophosphoric acid,*

  B. a mixture of 40 volumes of *tetrahydrofuran* , 170 volumes of *acetonitrile* and 790 volumes of the solution prepared by dissolving 1.1 g of *sodium octanesulphonate* in 1000 ml of *water.* Adjust to pH 2.0 with a 50 per cent v/v solution of *orthophosphoric acid,*
- flow rate. 1.5 ml per minute,
- a linear gradient programme using the conditions given below,
- spectrophotometer set at 230 nm,
- injection volume. 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0 → 40	100 → 0	0 → 100
40 → 50	0	100

Inject reference solution (a). Adjust the sensitivity of the system so that the peak-to-valley ratio is minimum 2.0, where H_p is height above the baseline of the peak due to impurity D and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to naloxone.

The relative retention time with reference to naloxone, for impurity C, impurity A, impurity F, impurity D, impurity E and impurity B is about 0.6 minute, 0.8 minute, 0.9 minute, 1.1 minutes, 3.0 minutes and 3.2 minutes respectively.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of each secondary peak corresponding to naloxone impurities A, B, C, E, F is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent). The area of secondary peak corresponding to naloxone impurity D is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent). The area of any other impurities is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The sum of the areas of all other secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.8 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with the reference solution (b) (0.05 per cent).

Water (2.3.43). 7.5 per cent to 11.0 per cent, determined on 0.2 g.

Sulphated ash (2.3.18). Not more than 0.2 per cent, determined on 0.5 g.

Assay. Weigh accurately about 0.3 g, dissolve in 50 ml of *ethanol (95 per cent)* and add 5.0 ml of *0.01 M hydrochloric acid.* Titrate with *0.1 M ethanolic sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M ethanolic sodium hydroxide* is equivalent to 0.03638 g of $C_{19}H_{22}ClNO_4$.

Storage. Store protected from light.

Naloxone Injection

Naloxone Injection is a sterile solution of Naloxone Hydrochloride in Water for Injections.

Naloxone Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of naloxone hydrochloride, $C_{19}H_{21}NO_4,HCl$.

Usual strength. 400 µg per ml.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 5 volumes of *methanol* and 95 volumes of the upper layer from a mixture of 60 ml of *M ammonia* and 100 ml of *butan-1-ol.*

Test solution. Add 1 ml of *ammonia buffer pH 10.0* to a volume of the injection containing the equivalent of 2 mg of anhydrous naloxone hydrochloride, extract with three 20 ml quantities of a mixture of 1 volume of *propan-2-ol* and 3 volumes of *chloroform*, dry the combined extracts over *anhydrous sodium sulphate*, filter, evaporate the filtrate to dryness and dissolve the residue in 1 ml of *methanol.* Dilute 1 ml of this solution to 20 ml with *methanol.*

Reference solution. A 0.01 per cent w/v solution of *naloxone hydrochloride RS* in *methanol.*

Apply to the plate 20 µl of each solution. Allow the mobile phase to rise 10 cm, protecting the plate from light. After development, dry the plate in a current of air, spray with a freshly prepared 0.5 per cent w/v solution of *potassium hexacyanoferrate (III)* in *iron(III) chloride solution* and examine in daylight. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 3.0 to 4.5.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 5 volumes of *methanol* and 95 volumes of the upper layer from a mixture of 60 ml of *2 M ammonia* and 100 ml of *butan-1-ol.*

Test solution. Transfer a volume of the injection containing about 2 mg of Naloxone Hydrochloride in 1 ml of *ammonia buffer pH 10.0*, extract with three 20 ml quantities of a mixture of 1 volume of *propan-2-ol* and 3 volumes of *chloroform*, dry the combined extracts over *anhydrous sodium sulphate*, filter, evaporate the filtrate to dryness and dissolve the residue in 1 ml of *methanol.*

Reference solution. Dilute 1 ml of the test solution to 200 ml with *methanol.*

Apply to the plate 20 µl of each solution. Allow the mobile phase to rise 10 cm, protecting the plate from light. After development, dry the plate in a current of air, spray with a freshly prepared 0.5 per cent w/v solution of *potassium hexacyanoferrate(III)* in *iron(III) chloride solution* and examine in daylight. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent). Ignore any spot remaining on the line of application.

Bacterial endotoxins (2.2.3). Not more than 70 IU per ml of the injection, diluted if necessary, with *water BET* to give a solution containing 0.04 per cent w/v of anhydrous Naloxone Hydrochloride.

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 0.1 volume of *orthophosphoric acid*, 45 volumes of *methanol* and 55 volumes of *water.*

Test solution. Dilute the injection equivalent to 0.001 per cent w/v of Naloxone Hydrochloride with the solvent mixture.

Reference solution (a). A 0.001 per cent w/v solution of *naloxone hydrochloride RS* in the solvent mixture.

Reference solution (b). A 0.001 per cent w/v solution of *naloxone hydrochloride RS* and 0.0005 per cent w/v solution of *noroxymorphone* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with end-capped octadecylsilane bonded to porous silica (5 to 10 µm) (such as Zorbax C18, 7 to 8 µm),
- mobile phase: a solution containing 0.068 per cent w/v of *sodium octanesulphonate* and 0.1 per cent w/v of *sodium chloride* in the solvent mixture,
- flow rate. 1 ml per minute,
- spectrophotometer set at 229 nm,
- injection volume. 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to naloxone and noroxymorphone in the chromatogram obtained with reference solution (b) is not less than 1.3.

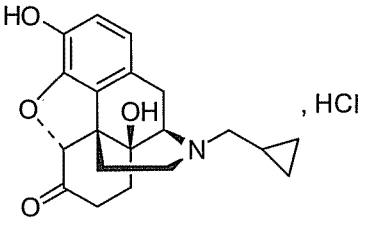
Injection reference solution (a) and the test solution.

Calculate the content of $C_{19}H_{21}NO_4,HCl$ in the injection.

Storage. Store protected from light.

Labelling. The label states the quantity of active ingredient in terms of the equivalent amount of anhydrous naloxone hydrochloride. When naloxone is prescribed for neonatal use, Neonatal Naloxone Injection (containing the equivalent of 20 micrograms per ml of anhydrous naloxone hydrochloride) shall be dispensed.

Naltrexone Hydrochloride



$C_{20}H_{24}ClNO_4$ Mol. Wt. 377.9

Naltrexone Hydrochloride is 17-(cyclopropylmethyl)-4,5α-epoxy-3,14-dihydroxymorphinan-6-one hydrochloride.

Naltrexone Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{20}H_{24}ClNO_4$, calculated on the anhydrous and ethanol free basis.

Category. Antidote for opioids poisoning.

Description. A white or almost white powder, very hygroscopic.

Identification

A. Dissolve 20 mg of the substance under examination in 5 ml of *water* and make alkaline with *dilute ammonia*. Shake with 10 ml of *dichloromethane*, separate the organic layer and evaporate the solvent. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *naltrexone hydrochloride RS* or with the reference spectrum of naltrexone hydrochloride.

B. Gives reaction A of chlorides (2.3.1).

Tests

Appearance of solution. A 2.0 per cent w/v solution in *carbon-dioxide free water* is clear (2.4.1) and not more intensely coloured than reference solution YS5 or BS5 (2.4.1).

Acidity or alkalinity. To 10 ml of 2.0 per cent w/v solution in *carbon-dioxide free water*, add 0.05 ml of *methyl red solution*. Not more than 0.2 ml of *0.02 M sodium hydroxide* or *0.02 M hydrochloric acid* is required to change the colour of the indicator.

Specific optical rotation (2.4.22). - 187° to - 195°, determined in a 2.0 per cent w/v solution in *water*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in 10 ml of *0.1 M hydrochloric acid*.

Reference solution (a). Dissolve 5 mg of *17-but-3-enyl-4,5α-epoxy-3,14-dihydroxymorphinan-6-one RS (naltrexone impurity C RS)* in 2.5 ml of *0.1 M hydrochloric acid*.

Reference solution (b). Dilute 1.0 ml of the test solution and 1.0 ml of reference solution (a) to 100 ml with *0.1 M hydrochloric acid*. Dilute 1.0 ml of this solution to 10 ml with *0.1 M hydrochloric acid*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature. 40°,
- mobile phase: A. a 0.11 per cent w/v solution of *sodium octanesulphonate*, adjust the pH to 2.3 with *orthophosphoric acid*,
  B. *acetonitrile*,
- a linear gradient programme using the conditions given below,
- flow rate. 1.2 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume. 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0-45	90→55	10→45
45-47	55→90	45→10
47-55	90	10

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to naltrexone and naltrexone impurity C is not less than 2.0. The relative retention time with reference to naltrexone for 17-formyl-4,5α-epoxy-3,14-dihydroxymorphinan-6-one (naltrexone impurity A) is about 0.4, for 4,5α-epoxy-3,14-dihydroxymorphinan-6-one (noroxymorphone) (naltrexone impurity B) is about 0.7, For 17-(cyclopropylmethyl)-4,5α-epoxy-3,10α,14-trihydroxymorphinan-6-one (naltrexone impurity F) is about 0.8, for 17-(cyclopropylmethyl)-4,5α-epoxy-3,10β ,14-trihydroxymorphinan-6-one (naltrexone impurity G) is about 0.9, for 17-but-3-enyl-4,5α-epoxy-3,14-dihydroxymorphinan-6-one (naltrexone impurity C) is about 1.05, for 17-butyl-4,5α-epoxy-3,14-dihydroxymorphinan-6-one (naltrexone impurity H) is about 1.1, for 17-(cyclopropylmethyl)-4,5α-epoxy-3,14-dihydroxymorphinan-6,10-dione (naltrexone impurity I) is about 1.2, for 7-(cyclopropylmethyl)-4,5α-epoxy-14-hydroxy-3-methoxymorphinan-6-one (naltrexone impurity J) is about 1.3, for 17,17′-bis(cyclopropylmethyl)-4,5α:4′,5′-α-diepoxy-

3,3′,14,14′-tetrahydroxy-2,2′-bimorphinanyl-6,6′-dione (pseudonaltrexone) (naltrexone impurity D) is about 1.4, for 3-(cyclopropylmethoxy)-17-(cyclopropylmethyl)-4,5α-epoxy-14-hydroxymorphinan-6-one (naltrexone impurity E) is about 1.7.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution the area any peak corresponding to naltrexone impurity C, D, E, F and G is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent); the area of any peak corresponding to naltrexone impurity A, B, H, I and J is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent); the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The sum of the areas of all secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Ethanol (2.3.45). Not more than 3.0 per cent v/v, determined by Method I using the following solutions.

Test solution. Dissolve 0.25 g of the substance under examination in 10 ml of *water.*

Reference solution. Dilute 0.75 g of *anhydrous ethanol* to 1000 ml with *water.*

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 10.0 per cent, determined on 0.2 g.

Assay. Weigh accurately about 0.2 g of the substance under examination, dissolve in 60 ml of *ethanol (95 per cent)* and add 1.0 ml of *0.1 M hydrochloric acid.* Titrate with *0.1 M sodium hydroxide,* determining the end-point potentiometrically (2.4.25). The curve shows 3 points of inflexion. Read the volume added between the first 2 points of inflexion.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.03779 g of $C_{20}H_{24}ClNO_4$.

Storage. Store protected from light and moisture.

Naltrexone Tablets

Naltrexone Hydrochloride Tablets

Naltrexone Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of naltrexone hydrochloride, $C_{20}H_{23}NO_4.HCl$.

Usual strength. 50 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1,
Medium. 900 ml of *water,*
Speed and time. 50 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate.

Reference solution. A solution of *naltrexone hydrochloride RS* in *water* to obtain the same concentration as given in the test solution.

Chromatographic system
- a stainless steel column 15 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature. 45°,
- mobile phase: a mixture of 600 volumes of 0.05 M buffer solution prepared by dissolving 7 g of *monobasic sodium phosphate* in 1000 ml of *water*, add 1.1 g of *sodium 1-octane sulphonate monohydrate* and 400 ml of *methanol*, adjust the pH to 6.7 with *dilute sodium hydroxide*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume. 100 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{23}NO_4.HCl$ in the tablets.

D. Not less than 80 per cent of the stated amount of $C_{20}H_{23}NO_4.HCl$.

Uniformity of content. Comply with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay, using the following solution as the test solution.

Test solution. Disperse 1 tablet in 100 ml of *0.1 M orthophosphoric acid.*

Calculate the content of $C_{20}H_{23}NO_4.HCl$ in the tablets.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Shake a quantity of powdered tablets containing about 250 mg of Naltrexone with 80 ml of *0.1 M orthophosphoric acid*, sonicate for 30 minutes and dilute to 100 ml with the same solvent, filter.

Reference solution (a). Dissolve 22.5 mg of *naltrexone RS* in 1.5 ml of *methanol* and 0.6 ml of *0.1 M hydrochloric acid.* Dilute to 10 ml with *0.1 M orthophosphoric acid.*

Reference solution (b). Dissolve about 3 mg of *N-(3-butenyl)-noroxymorphone hydrochloride RS (naltrexone impurity A RS)* in 3.0 ml of *methanol* and dilute to 10 ml with *0.1 M orthophosphoric acid.* To 0.5 ml of this solution, add 5.0 ml of reference solution (a) and dilute to 10 ml with *0.1 M orthophosphoric acid.*

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature. 45°,
- mobile phase: A. dissolve about 1.08 g of *sodium 1-octanesulphonate* and 23.8 g of *sodium acetate* in 800 ml of *water*. Add 1.0 ml of *triethylamine* and 200 ml of *methanol*, adjust the pH to 6.5 with *glacial acetic acid*, B. dissolve about 1.08 g *sodium 1-octanesulphonate* and 23.8 g *sodium acetate* in 400 ml of *water*. Add 1.0 ml of *triethylamine* and 600 ml of *methanol*, adjust the pH to 6.5 with *glacial acetic acid*,
- a linear gradient programme using the conditions given below,
- flow rate. 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume. 20 µl.

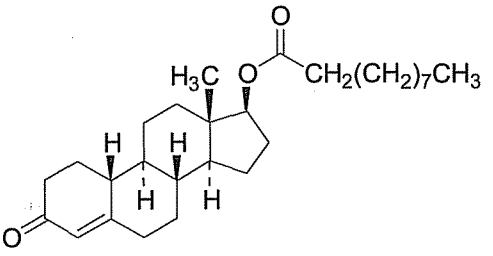
Time (min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
1-35	100→0	0→100
35-36	0→100	100→0

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to naltrexone and naltrexone impurity A is not less than 2.0, the tailing factor is not more than 1.4, and the relative standard deviation for replicate injections is not more than 2.0 per cent. The relative retention time with reference to naltrexone for noroxymorphone is about 0.55, for 10-hydroxynaltrexone is about 0.7, for naltrexone impurity A is about 1.26, for 2,2α-bisnaltrexone is about 1.80 and for 10-ketonaltrexone is about 1.99.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{20}H_{23}NO_4.HCl$ in the Tablets.

Nandrolone Decanoate



$C_{28}H_{44}O_3$ Mol. Wt. 428.7

Nandrolone Decanoate is 3-oxo-4-estren-17β-yl decanoate.

Nandrolone Decanoate contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{28}H_{44}O_3$, calculated on the dried basis.

Category. Anabolic steroid.

Dose. By intramuscular injection, 25 to 50 mg, every 3 weeks.

Description. A white to creamy-off white, crystalline powder; odour, faint and characteristic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nandrolone decanoate RS* or with the reference spectrum of nandrolone decanoate.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *ethanol (95 per cent)* shows an absorption maximum only at about 239 nm; absorbance at about 239 nm, about 0.41.

C. Dissolve 25 mg in 1 ml of *methanol*, add 2 ml of *semicarbazide acetate solution*, heat under a reflux condenser for 30 minutes and cool; the precipitate, after recrystallisation from *ethanol (95 per cent)*, melts at about 175° (2.4.21).

Tests

Specific optical rotation (2.4.22). +32.0° to +36.0°, determined in a 2.0 per cent w/v solution in *dioxan*.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 70 volumes of *heptane* and 30 volumes of *acetone.*

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of *chloroform.*

Reference solution (a). A 0.005 per cent w/v solution of the substance under examination in *chloroform.*

Reference solution (b). A 0.01 per cent w/v solution of *nandrolone RS* in *chloroform.*

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. In the chromatogram obtained with the test solution any spot corresponding to nandrolone is not more intense than the spot in the chromatogram obtained with reference solution (b) and any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (a).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa for 4 hours.

Assay. Weigh accurately about 10 mg and dissolve in sufficient *ethanol (95 per cent)* to produce 100.0 ml. Dilute 5.0 ml to 50.0 ml with *ethanol (95 per cent)* and measure the absorbance of the resulting solution at the maximum at about 239 nm (2.4.7). Calculate the content of $C_{28}H_{44}O_3$ taking 407 as the specific absorbance at 239 nm.

Storage. Store protected from light and moisture.

Nandrolone Decanoate Injection

Nandrolone Decanoate Injection is a sterile solution of Nandrolone Decanoate in Ethyl Oleate or other suitable ester, in a suitable fixed oil or in any mixture of these.

Nandrolone Decanoate Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nandrolone decanoate, $C_{28}H_{44}O_3$.

Usual strength. 25 mg per ml.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 70 volumes of *heptane* and 30 volumes of *acetone*.

Test solution. Dilute a suitable volume of the injection with *carbon tetrachloride* to give a solution containing 0.5 per cent w/v solution of Nandrolone Decanoate.

Reference solution. A 0.5 per cent w/v solution of *nandrolone decanoate RS* in *carbon tetrachloride*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air until the odour of solvent is no longer detectable, spray with a 10 per cent v/v solution of *sulphuric acid* in *ethanol (95 per cent)*, heat at 105° for 30 minutes and examine in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution. Ignore any subsidiary spots due to the vehicle.

Tests

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

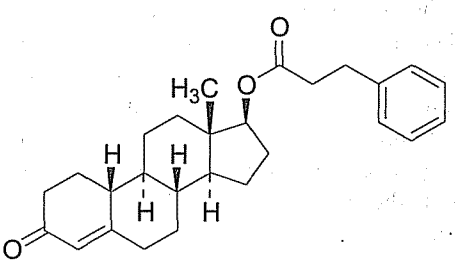
Assay. To an accurately measured volume containing about 0.1 g of Nandrolone Decanoate add sufficient *chloroform* to produce 100.0 ml. Dilute 3.0 ml of the solution to 50.0 ml with *chloroform*. To 5.0 ml of this solution add 10 ml of *isoniazid solution* and sufficient *methanol* to produce 20.0 ml. Allow to stand for 45 minutes and measure the absorbance of the resulting solution at the maximum at about 380 nm (2.4.7), using as the blank 5 ml of *chloroform* treated in the same manner. Calculate the content of $C_{28}H_{44}O_3$ from the absorbance obtained by repeating the operation using a suitable quantity of *nandrolone RS*.

1 mg of $C_{18}H_{26}O_2$ is equivalent to 1.562 mg of $C_{28}H_{44}O_3$.

Storage. Store protected from light.

Nandrolone Phenylpropionate

Nandrolone Phenpropionate



$C_{27}H_{34}O_3$ Mol.Wt. 406.6

Nandrolone Phenylpropionate is 3-oxo-4-estren-17β-yl 3-phenylpropionate.

Nandrolone Phenylpropionate contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{27}H_{34}O_3$, calculated on the dried basis.

Category. Anabolic steroid.

Dose. By deep intramuscular injection, 25 to 50 mg weekly.

Description. A white to creamy-white, crystalline powder; odour, characteristic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nandrolone phenylpropionate RS* or with the reference spectrum of nandrolone phenylpropionate.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *ethanol (95 per cent)* shows an

absorption maximum only at about 240 nm; absorbance at about 240 nm, about 0.43.

C. Dissolve 25 mg in 1 ml of *methanol*, add 2 ml of *semicarbazide acetate solution*, heat under a reflux condenser for 30 minutes and cool; the precipitate, after recrystallisation from *ethanol (95 per cent)* melts at about 182° (2.4.21).

Tests

Specific optical rotation (2.4.22). +48.0° to +51.0°, determined in a 1.0 per cent w/v solution in *dioxan*.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 70 volumes of *heptane* and 30 volumes of *acetone*.

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of *chloroform*.

Reference solution (a). A 0.005 per cent w/v solution of the substance under examination in *chloroform*.

Reference solution (b). A 0.01 per cent w/v solution of *nandrolone RS* in *chloroform*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. In the chromatogram obtained with the test solution any spot corresponding to nandrolone is not more intense than the spot in the chromatogram obtained with reference solution (b) and any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (a).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa for 4 hours.

Assay. Weigh accurately about 10 mg, dissolve in sufficient *ethanol* to produce 100.0 ml, dilute 5.0 ml to 50.0 ml with *ethanol* and measure the absorbance of the resulting solution at the maximum at about 240 nm (2.4.7). Calculate the content of $C_{27}H_{34}O_3$ taking 430 as the specific absorbance at 240 nm.

Storage. Store protected from light.

Nandrolone Phenylpropionate Injection

Nandrolone Phenylpropionate Injection is a sterile solution of Nandrolone Phenylpropionate in Ethyl Oleate or other suitable ester, in a suitable fixed oil or in a mixture of these.

Nandrolone Phenylpropionate Injection contains not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of nandrolone phenylpropionate, $C_{27}H_{34}O_3$.

Usual strengths. 25 mg per ml; 50 mg per ml.

Identification

Dissolve a volume of the injection containing 50 mg of Nandrolone Phenylpropionate in 8 ml of *light petroleum (40° to 60°)* and extract with three 8-ml quantities of a mixture of 7 volumes of *glacial acetic acid* and 3 volumes of *water*. Wash the combined extracts with 10 ml of *light petroleum (40° to 60°)*, dilute with *water* until the solution becomes turbid, allow to stand for 2 hours in ice and filter. The precipitate, after washing with *water* and drying over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa, complies with the following test.

Determine by thin-layer chromatography (2.4.17), using a *silica gel GF254* precoated plate the surface of which has been modified by chemically-bonded octadecylsilyl groups.

Mobile phase. A mixture of 20 volumes of *water*, 40 volumes of *acetonitrile* and 60 volumes of *propan-2-ol*.

Test solution. A 0.5 per cent w/v solution of the dried precipitate in *chloroform*.

Reference solution (a). A 0.5 per cent w/v solution of *nandrolone phenylpropionate RS* in *chloroform*.

Reference solution (b). A mixture of equal volumes of the test solution and the reference solution.

Apply to the plate 5 µl of each solution. After development, dry the plate in air until the solvent has evaporated and heat it at 100° for 10 minutes. Allow to cool and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single spot.

Tests

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

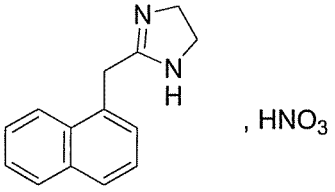
Assay. To an accurately measured volume containing about 0.1 g of Nandrolone Phenylpropionate add sufficient *chloroform* to produce 100.0 ml. Dilute 3.0 ml of this solution to 50.0 ml with *chloroform*. To 5.0 ml of the resulting solution add 10 ml of *isoniazid solution* and sufficient *methanol* to produce 20.0 ml. Allow to stand for 45 minutes and measure the absorbance of the solution at the maximum at about 380 nm (2.4.7), using as blank 5 ml of *chloroform* treated in the same manner. Calculate the content of $C_{27}H_{34}O_3$ from the

absorbance obtained from a 0.006 per cent w/v solution of *nandrolone phenylpropionate RS* treated in the same manner.

Storage. Store protected from light.

Labelling. The label states that the preparation is for intramuscular injection only.

Naphazoline Nitrate



$C_{14}H_{14}N_2,HNO_3$ Mol. Wt. 273.3

Naphazoline Nitrate is 2-(1-napthylmethyl)-2-imidazoline nitrate.

Naphazoline Nitrate contains not less than 99.0 per cent and not more than 101.0 per cent of $C_4H_{14}N_2,HNO_3$ calculated on the dried basis.

Category. Sympathomimetic.

Description. A white or almost white crystalline powder.

Identification

Test A *may be omitted if tests B, C and D are carried out. Tests B and* C *may be omitted if tests* A *and D are carried out.*

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *naphazoline nitrate RS.*

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.002 per cent w/v solution in *0.01 M hydrochloric acid* shows absorption maxima at about 270 nm, 280 nm, 287 nm and 291 nm; absorbances at these maxima are about 0.43, 0.50, 0.35 and 0.34 respectively.

C. Dissolve about 0.5 mg in 1 ml of *methanol,* add 0.5 ml of a freshly prepared 5 per cent w/v solution of *sodium nitroprusside* and 0.5 ml of a 2 per cent w/v solution of *sodium hydroxide*, allow to stand for 10 minutes and add 1 ml of a 8 per cent w/v solution of *sodium bicarbonate;* a violet colour is produced.

D. Dissolve about 10 mg in 5 ml of *water,* add 0.2 g of *magnesium oxide,* shake mechanically for 30 minutes, add 10 ml of *chloroform* and shake vigorously. Allow to stand, separate the chloroform layer, filter and evaporate the aqueous layer to dryness. The residue gives reaction A for nitrates (2.3.1).

Tests

Appearance of solution. A 1.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1) and colourless (2.4.1).

pH (2.4.24). 5.0 to 6.5, determined in a 1.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 100 ml of the mobile phase.

Reference solution (a). Dissolve 5 mg of *1-naphthylacetic acid* in the mobile phase, add 5 ml of the test solution and dilute to 100 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *naphazoline impurity A RS* in 100 ml of the mobile phase. Dilute 5.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (c). Dilute 2.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (4 µm),
- mobile phase: dissolve 1.1 g of *sodium octanesulphonate* in a mixture of 5 volumes of *glacial acetic acid,* 300 volumes of *acetonitrile* and 700 volumes of *water*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume. 20 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to naphazoline and naphazoline impurity B is not less than 5.0. The relative retention time with reference to naphazoline for naphthylacetylethylenediamine (naphazoline impurity A) is about 0.76, for 1-naphthylacetic acid (naphazoline impurity B) is about 1.27, for 1-naphthylacetonitrile (naphazoline impurity C) is about 2.8, for ß-naphazoline (naphazoline impurity D) is about 1.28.

Inject the test solution, reference solution (b) and (c). Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of the peak due to naphazoline impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). The area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent). The sum of all the secondary peaks is not more than 5 times the area of the principle peak in the chromatogram obtained with reference solution (c) (1.0 per cent), Ignore any peak with an area less than 0.25 times the

area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Naphthylacetylethylenediamine. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 100 volumes of *methanol* and 1.5 volumes of *strong ammonia solution*.

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of *methanol*.

Reference solution. A solution containing 2 per cent w/v of *naphazoline nitrate RS* and 0.01 per cent w/v of *naphthylacetylethylenediamine hydrochloride RS*.

Apply to the plate 10 µl of each solution. After development, dry the plate at 105° for 5 minutes, spray with a 0.5 per cent w/v solution of *ninhydrin* in *methanol* and heat at 105° for 10 minutes. Any spot corresponding to naphthylacetylethylenediamine hydrochloride in the chromatogram obtained with the test solution is not more intense than the corresponding spot in the chromatogram obtained with the reference solution. The test is not valid unless the chromatogram obtained with the reference solution shows two clearly separated spots.

Chlorides (2.3.12). 15.0 ml of 1.0 per cent w/v solution in *carbon dioxide-free water* complies with the limit test for chlorides (375 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

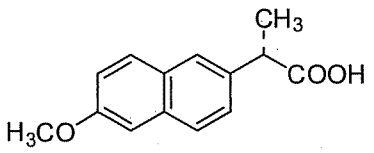
Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Weigh accurately about 0.2 g, dissolve in 30 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02733 g of $C_4H_{14}N_2,HNO_3$.

Storage. Store protected from light.

Naproxen



$C_{14}H_{14}O_3$ Mol. Wt. 230.3

Naproxen is (2*S*)-2-(6-methoxynaphthalen-2-yl)propionic acid.

Naproxen contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{14}H_{14}O_3$, calculated on the dried basis.

Category. Nonsteroidal antiinflammatory.

Description. A white or almost white crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *naproxen RS* or with the reference spectrum of naproxen.

B. When examined in the range 230 nm to 350 nm (2.4.7), a 0.04 per cent w/v solution in *methanol* shows absorption maxima at about 262 nm, 271 nm, 316 nm and 331 nm. The absorbance at the maxima are 216 to 238, 219 to 241, 61 to 69 and 79 to 87 respectively.

C. Melting range (2.4.21). 154° to 158°.

Tests

Appearance of solution. A 5.0 per cent w/v solution in *methanol* is clear (2.4.1) and not more intensely coloured than reference solution BYS6 (2.4.1).

Specific optical rotation (2.4.22). + 59° to + 62°, determined in a 2.0 per cent w/v solution in *ethanol (95 per cent)*.

Enantiomeric purity. Determine by liquid chromatography (2.4.14).

NOTE—Protect the solutions from light.

Test solution. Dissolve 25 mg of the substance under examination in 50 ml of *tetrahydrofuran*. Dilute 2.0 ml of this solution to 20 ml with the mobile phase.

Reference solution (a). Dilute 2.5 ml of the test solution to 100 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *racemic naproxen RS* in 10 ml of *tetrahydrofuran*, dilute to 100 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with silica gel π-acceptor/π-donor for chiral separations (5 µm),
- column temperature. 25°,
- mobile phase: a mixture of 5 volumes of *glacial acetic acid*, 50 volumes of *acetonitrile*, 100 volumes of *2-propanol* and 845 volumes of *hexane*,
- flow rate. 2 ml per minute,
- spectrophotometer set at 263 nm,
- injection volume. 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to (2*R*)-2-(6-methoxynaphthalen-2-yl) propanoic acid (naproxen impurity G) ((*R*)-enantiomer) and naproxen is not less than 3.0.

Inject reference solution (a) and the test solution. Run the chromatogram 1.5 times the retention time of the principal peak. The area of the peak due to naproxen impurity G is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (2.5 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Protect the solutions from light.

Test solution. Dissolve 12 mg of the substance under examination in 20 ml of the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 50 ml with the mobile phase. Dilute 1.0 ml of this solution to 20.0 ml with the mobile phase.

Reference solution (b). Dissolve 6 mg of *2-bromo-6-methoxynaphthalene RS (Naproxen impurity N RS),* 6 mg of *1-(6-methoxynaphthalen-2-yl)ethanone RS(Naproxen impurity L RS)* and 6 mg of *(1RS)-1-(6- methoxynaphthalen-2-yl)ethanol RS (Naproxen impurity K RS)* in 10 ml of *acetonitrile.* To 1.0 ml of this solution, add 1.0 ml of the test solution and dilute to 50 ml with the mobile phase. Dilute 1.0 ml of this solution to 20 ml with the mobile phase.

Chromatographic system

- a stainless steel column 10 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature. 50°,
- mobile phase: a mixture of 42 volumes of *acetonitrile* and 58 volumes of a 0.136 per cent w/v solution of *potassium dihydrogen phosphate* adjust the pH to 2.0 with *orthophosphoric acid,*
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume. 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to naproxen impurity K and naproxen is not less than 2.2. The relative retention time with reference to naproxen for naproxen impurity K is about 0.9, for naproxen impurity L is about 1.4 and naproxen impurity N is about 5.3.

Inject reference solution (a), (b) and the test solution . Run the chromatogram 1.5 times the retention time of naproxen impurity N. The area of the peak due to naproxen impurity L is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.1 per cent); the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). The sum of the areas of all impurities is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Weigh accurately about 0.2 g and dissolve in a mixture of 25 ml of *water* and 75 ml of *methanol.* Titrate with *0.1 M sodium hydroxide* using 1 ml of *phenolphthalein solution* as indicator.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.02303 g of $C_{14}H_{14}O_3$.

Storage. Store protected from light.

Naproxen Oral Suspension

Naproxen Oral Suspension is an aqueous suspension of Naproxen in a suitable flavoured vehicle.

Naproxen Oral Suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of naproxen, $C_{14}H_{14}O_3$.

Usual strength. 25 mg per ml.

Identification

Evaporate 50 ml of solution A obtained in the Assay, to dryness using a rotary evaporator. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6).Compare the spectrum with that obtained with *naproxen RS* or with the reference spectrum of naproxen.

B. When examined in the range 230 nm to 350 nm (2.4.7), a 0.004 per cent w/v solution in *methanol* exhibits maxima at 262 nm, 271 nm, 316 nm and 331 nm.

Tests

pH (2.4.24). 2.1 to 4.0.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 3 volumes of *glacial acetic acid,* 9 volumes of *tetrahydrofuran* and 90 volumes of *toluene.*

Test solution. Evaporate solution A obtained in the Assay to dryness on a rotary evaporator and dissolve the residue in sufficient *methanol* to produce a solution containing 5.0 per cent w/v of naproxen.

Reference solution. Dilute 1 ml of the test solution to 200 ml with *methanol.*

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Other tests. Complies with the tests stated under Oral Liquids.

Assay. To a quantity of the oral suspension containing 0.5 g of Naproxen add 20 ml of *3.5 M hydrochloric acid*, mix, extract with three 50 ml quantities of *chloroform*, filter each extract through *anhydrous sodium sulphate*, combine the filtrates and add sufficient *chloroform* to produce 200 ml (solution A). To 5 ml of solution A add sufficient *methanol* to produce 250 ml and measure the absorbance of the resulting solution at the maximum at about 331 nm (2.4.7).

Calculate the content of $C_{14}H_{14}O_3$ taking 81 as the specific absorbance at 331 nm.

Naproxen Suppositories

Naproxen Suppositories contain Naproxen in a suitable suppository base.

Naproxen Suppositories contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of naproxen, $C_{14}H_{14}O_3$.

Usual strength. 500 mg.

Identification

Dissolve a quantity of the suppositories containing 0.5 g of Naproxen in 50 ml of *2,2,4-trimethylpentane* and extract with four 25 ml quantities of *methanol (80 per cent)*. To the combined extracts add 100 ml of a 2 per cent w/v solution of *sodium chloride*, extract with four 25 ml quantities of *chloroform*, dry the combined extracts over *anhydrous sodium sulphate*, filter and add sufficient *chloroform* to produce 200 ml (solution A). Evaporate 100 ml of solution A to dryness using a rotary evaporator. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *naproxen RS* or with the reference spectrum of naproxen.

B. When examined in the range 230 nm to 350 nm (2.4.7), a 0.004 per cent w/v solution in *methanol* exhibits maxima at 262 nm, 271 nm, 316 nm and 331 nm.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 3 volumes of *glacial acetic acid*, 9 volumes of *tetrahydrofuran* and 90 volumes of *toluene.*

Test solution. Weigh 20 suppositories and cut into small pieces. Dissolve a quantity of the suppositories containing 0.5 g of Naproxen in 50 ml of *2,2,4-trimethylpentane* and extract with four 25-ml quantities of *methanol (80 per cent).* Combine the extracts, add 100 ml of a 2 per cent w/v solution of *sodium chloride*, extract with four 25-ml quantities of *chloroform* filtering each extract through a layer of *anhydrous sodium sulphate* on an absorbent cotton plug moistened with *chloroform.* Evaporate the combined filtrates to dryness using a rotary evaporator with the aid of gentle heat. Shake the residue with 10 ml of *methanol*, centrifuge and use the supernatant liquid.

Reference solution. Dilute1 ml of the test solution to 200 ml with *methanol.*

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Other tests. Comply with the tests stated under Suppositories.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse ten suppositories in 500 ml of *methanol* on a water-bath for 40 minutes with the aid of ultrasound and by swirling the flask. Cool at 5° for 1 hour, centrifuge and use the clear, supernatant liquid; if the solution is still cloudy filter through glass-fibre paper (such as Whatman GF/C). To 5 ml of the filtrate add sufficient of the mobile phase to produce a solution containing 0.01 per cent w/v of naproxen.

Reference solution (a). A 0.01 per cent w/v solution of *naproxen RS* in the mobile phase.

Reference solution (b). A 0.01 per cent w/v each of *naproxen RS* and *2-naphthylacetic acid* in the mobile phase.

Chromatographic system

- a stainless steel column 20 cm × 4 mm, packed with end-capped octadecylsilane bonded to porous silica (5 µm) (such as Nucleosil C18),
- mobile phase: a mixture of 1 volume of a 0.52 per cent w/v solution of *sodium acetate*, adjusted to pH 5.8 using *glacial acetic acid* and 1 volume of *methanol,*

- flow rate. 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to naproxen and 2-naphthylacetic acid in the chromatogram obtained with the reference solution (b) is more than 3.0.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{14}H_{14}O_3$ in the suppositories.

Storage. Store protected from light.

Naproxen Sustained-release Tablets

Naproxen Sustained-release Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of naproxen, $C_{14}H_{14}O_3$.

Usual strength. 375 mg.

Identification

A. When examined in the range 200 nm to 400 nm (2.4.7), the solution used in test B of dissolution, exhibits an absorption maximum at about 332 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution (b).

Tests

Dissolution (2.5.2).

A. Apparatus No. 1,
Medium. 1000 ml of *0.1 M hydrochloric acid,*
Speed and time. 50 rpm and 2 hours.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the medium if necessary, at the maximum at about 332 nm (2.4.7). Calculate the content of $C_{14}H_{14}O_3$ in the medium from the absorbance obtained from a solution of known concentration of *naproxen RS* in the same medium.

D. Not more than 10 per cent of the stated amount of $C_{14}H_{14}O_3$.

B. Apparatus No. 1,

Medium. 1000 ml of *0.2 M phosphate buffer pH 6.8,*
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the medium if necessary, at the maximum at about 332 nm (2.4.7). Calculate the content of $C_{14}H_{14}O_3$ in the medium from the absorbance obtained from a solution of known concentration of *naproxen RS* in the same medium.

D. Not less than 80 per cent of the stated amount of $C_{14}H_{14}O_3$.

Uniformity of content. Comply with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay using the following solutions.

Test solution. Disperse 1 tablet in about 140 ml of solvent mixture B. Shake for 15 minutes, sonicate for 15 minutes, dilute to 200 ml with solvent mixture B, filter. Dilute 2.0 ml of the filtrate to 50 ml with the mobile phase .

Reference solution. A 0.025 per cent w/v solution of *naproxen RS* in solvent mixture A. Dilute 10 ml of this solution to 25 ml with solvent mixture B.

Calculate the content of $C_{14}H_{14}O_3$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture A. 90 volumes of *acetonitrile* and 10 volumes of *water.*

Solvent mixture B. 50 volumes of *acetonitrile* and 50 volumes of *water.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing about 250 mg of Naproxen in 70 ml of solvent mixture B, sonicate for 15 minutes and dilute to 100.0 ml with solvent mixture B and filter. Dilute 2.0 ml of the filtrate to 50 ml with the mobile phase.

Reference solution (a). A 0.05 per cent w/v solution of *naproxen RS* in solvent mixture A.

Reference solution (b). Dilute 10 ml of reference solution (a) to 50 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 55 volumes of 1.0 per cent v/v solution of *acetic acid* and 45 volumes of *acetonitrile,*
- flow rate. 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 50 µl.

Inject reference solution (b). The test is not valid unless the tailing factor of the principal peak is not more than 1.5 per cent and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and reference solution (b).

Calculate the content of $C_{14}H_{14}O_3$ in the tablet.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Naproxen Tablets

Naproxen Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of naproxen, $C_{14}H_{14}O_3$.

Usual strengths. 250 mg; 500 mg.

Identification

A. Extract a quantity of the powdered tablets containing 20 mg of Naproxen with 100 ml of *methanol* and filter. Evaporate and dry the residue at 105°. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *naproxen RS* or with the reference spectrum of naproxen.

B. When examined in the range 230 nm to 350 nm (2.4.7), a 0.002 per cent w/v solution in *methanol* exhibits maxima at 262 nm, 271 nm, 316 nm and 331 nm.

Tests

Dissolution (2.5.2).

Apparatus No.1,
Medium. 900 ml of a phosphate buffer prepared by dissolving 2.62 g of *sodium dihydrogen orthophospate monohydrate* and 11.5 g of *anhydrous disodium hydrogen orthophosphate* in sufficient *water* to produce 1000 ml, adjusted to pH 7.4 with *0.1 M sodium hydroxide* or *0.1 M hydrochloric acid,*
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with the dissolution medium if necessary, at the maximum at about 332 nm (2.4.7). Calculate the content of $C_{14}H_{14}O_3$, in the medium from the absorbance obtained from a solution of known concentration of *naproxen RS* in the same medium.

D. Not less than 70 per cent of the stated amount of $C_{14}H_{14}O_3$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 3 volumes of *glacial acetic acid*, 9 volumes of *tetrahydrofuran* and 90 volumes of *toluene*.

Test solution. Shake a quantity of the powdered tablets containing about 0.5 g of Naproxen with 10 ml of *methanol* for 15 minutes, centrifuge and use the supernatant liquid.

Reference solution. Dilute 1 ml of the test solution to 200 ml with *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

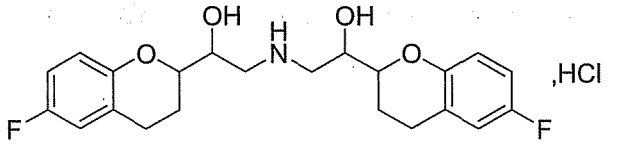
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Shake a quantity of the powder containing about 50 mg of Naproxen with 70 ml of *methanol* for 30 minutes, add sufficient *methanol* to produce 100 ml and filter. Dilute 10 ml of the filtrate to 50 ml with *methanol* and measure the absorbance at the maximum at about 331 nm (2.4.7) using a 0.01 per cent w/v solution of *naproxen RS* in *methanol*.

Calculate the content of $C_{14}H_{14}O_3$ in the tablets.

Storage. Store protected from light.

Nebivolol Hydrochloride



$C_{22}H_{25}F_2NO_4,HCl$ Mol. Wt. 441.9

Nebivolol Hydrochloride is (1*RS*,1'*RS*)-1, 1'-[(2*RS*,2'*SR*)-bis (6-flurochroman-2-yl)]-2,2'-iminodiethanol hydrochloride.

Nebivolol Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{22}H_{25}F_2NO_4,HCl$, calculated on the anhydrous basis.

Category. Antihypertensive.

Description. A white to off-white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nebivolol hydrochloride RS* or with the reference spectrum of nebivolol hydrochloride.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 30 mg of the substance under examination in 5 ml of *acetonitrile* and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 30 mg of *nebivolol hydrochloride RS* in 5 ml of *acetonitrile* and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with porous silica (5 µm) with chemically bonded phenyl groups,

- mobile phase: a mixture of 28 volumes of *acetonitrile*, 72 volumes of a buffer solution prepared by dissolving 3.4 g of *tetrabutyl ammonium hydrogen sulphate* in 1000 ml *water*, and 0.3 volume of *diethylamine*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume. 20 µl.

Inject reference solution (a). The test is not valid unless the column efficiency in not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution and reference solution (b). In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than the area of the peak in the chromatogram obtained with reference solution (b) (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 0.3 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 35 mg of the substance under examination in 5 ml of *acetonitrile* and dilute to 50.0 ml with the mobile phase. Dilute 10.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution. Dissolve 35 mg of *nebivolol hydrochloride RS* in 5 ml of *acetonitrile* and dilute to 50.0 ml with the mobile phase. Dilute 10.0 ml of this solution to 100.0 ml with the mobile phase.

Use the chromatographic system described under Related substances.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{22}H_{25}F_2NO_4$, HCl.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Nebivolol Tablets

Nebivolol Hydrochloride Tablets

Nebivolol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nebivolol, $C_{22}H_{25}F_2NO_4$.

Usual strength. 5 mg

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1,
Medium. 500 ml *0.1 M hydrochloric acid*,
Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14) as described under Assay using the following solutions and a flow rate of 1.5 ml per minute.

Test solution. The filtrate obtained as given above.

Reference solution. A solution containing *nebivolol hydrochloride RS* equivalent to 0.001 per cent w/v of nebivolol, in the dissolution medium.

D. Not less than 70 per cent of the stated amount of $C_{22}H_{25}F_2NO_4$.

Uniformity of content. Comply with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), using the chromatographic conditions and the reference solution described in the Assay.

Test solution. Disperse one tablet in the mobile phase, dilute to obtain a solution containing 0.005 per cent w/v of nebivolol in the mobile phase and filter.

Calculate the content of $C_{22}H_{25}F_2NO_4$ in the tablets.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 5 mg of nebivolol, disperse in 100.0 ml of the mobile phase and filter.

Reference solution. A solution containing *nebivolol hydrochloride RS* equivalent to 0.005 per cent w/v of nebivolol, in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 45 volumes of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adding 2 ml of *triethylamine* and adjusting the pH to 3.0 with 10 per cent v/v *orthophosphoric acid*, 25 volumes of *acetonitrile* and 30 volumes of *methanol*,

- flow rate. 1 ml per minute,
- spectrophotometer set at 281 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

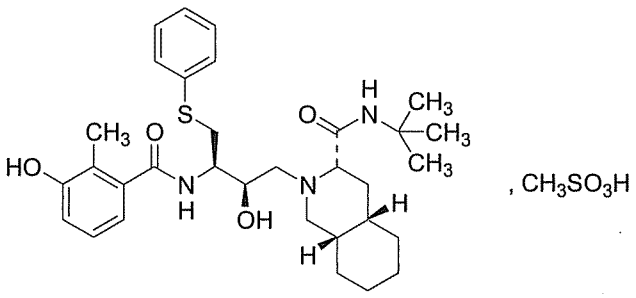
Inject the test solution and the reference solution.

Calculate the content of $C_{22}H_{25}F_2NO_4$ in the tablets.

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of the equivalent amount of nebivolol.

Nelfinavir Mesylate



$C_{32}H_{45}N_3O_4S,CH_4O_3S$ Mol. Wt. 663.9

Nelfinavir Mesylate is (3*S*,4a*S*,8a*S*)-*N*-(*tert*-butyldecahydro-2-[(2*R*,3*R*)-3-(3-hydroxy-*o*-toluamido)-hydroxy-4-(phenylthio)butyl]isoquinoline-3-carboxamide methyl sulphonate.

Nelfinavir Mesylate contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{32}H_{45}N_3O_4S,CH_4O_3S$, calculated on the anhydrous basis.

Category. Antiretroviral.

Dose. 1.25 g twice daily.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nelfinavir mesylate RS* or with the reference spectrum of nelfinavir mesylate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). –105° to –120°, determined in a 1.0 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14), using the chromatographic system described in the Assay.

Test solution. A 0.1 per cent w/v solution of the substance under examination in the mobile phase.

Reference solution (a). A 0.001 per cent w/v solution of the substance under examination in the mobile phase.

Reference solution (b). A 0.01 per cent w/v solution of *methanesulphonic acid* in the mobile phase.

Inject reference solution (a). The test is not valid unless the column efficiency determined from the nelfinavir peak is not less than 4000 theoretical plates and the tailing factor is not more than 2.0.

Separately inject reference solution (b) and record the chromatograms. Separately inject the test solution and continue the chromatography for at least three times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak other than the principal peak is not greater than half of the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of the areas of all such peaks is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak due to methanesulphonic acid corresponding to the retention time of the principal peak in the chromatogram obtained with reference solution (b).

Methanesulphonic acid. 13.5 per cent to 15.5 per cent w/w, calculated on the anhydrous basis, determined by the following method. Weigh accurately about 0.6 g, dissolve in 50 ml of *dimethylformamide* and titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.00961 g of CH_3SO_3H.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 3.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. A 0.01 per cent w/v solution of the substance under examination in the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *nelfinavir mesylate RS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a filtered and degassed mixture of 45 volumes of *acetonitrile*, 20 volumes of *methanol* and 35 volumes of a buffer prepared by dissolving 4.0 g of *sodium dihydrogen phosphate* in 1000 ml of *water*, to which 1 ml of *dimethylamine* solution and 1 g of *sodium octanesulphonate* are added and mixed to dissolve,
- flow rate. 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency determined from the nelfinavir peak is not less than 5000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Separately inject the test solution and the reference solution and measure the responses for the principal peak. Calculate the content of $C_{32}H_{45}N_3O_4S,CH_4O_3S$.

Storage. Store protected from light.

Nelfinavir Mesylate Oral Powder

Nelfinavir Mesylate Oral Powder contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nelfinavir, $C_{32}H_{45}N_3O_4S$.

Usual strength. 50 mg per g.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus. No 1

Medium. 900 ml of *0.1 M hydrochloric acid.*

Speed and time. 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate and, if necessary, dilute with the dissolution medium.

Reference solution. A 0.065 per cent w/v solution of *nelfinavir mesylate RS* in *methanol.* Dilute 10 ml of the solution to 100 ml with the dissolution medium.

Use the chromatographic system described under Assay.

Inject the test solution and the reference solution.

D. Not less than 75 per cent of the stated amount of $C_{32}H_{45}N_3O_4S$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh accurately a quantity of the oral powder containing 50 mg of Nelfinavir Mesylate, disperse in 10 ml of *methanol*, dilute to 50 ml with the mobile phase and filter.

Reference solution (a). Dissolve 10 mg of *nelfinavir mesylate RS* in 2 ml of *methanol* and dilute to 10 ml with the mobile phase.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature. 45°,
- mobile phase: a mixture of 28 volumes of a buffer solution prepared by dissolving 4.88 g of *anhydrous sodium dihydrogen phosphate* in 1000 ml of *water*, adjusting the pH to 3.4 with *phosphoric acid* and filtering, 27 volumes of *acetonitrile*, 20 volumes of *methanol* and 25 volumes of *water*. Adjust the pH to 4.8 with *0.1 M sodium hydroxide* or *orthophosphoric acid.*
- flow rate. 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume. 10 µl.

Inject the reference solution (a). The test is not valid unless the tailing factor is not more than 2.0 and the column efficiency in not less than 4000 theoretical plates.

Inject the test solution and reference solution (b). In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with the reference solution (b) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the peak in the chromatogram obtained with the reference solution (b) (2.0 per cent).

Water (2.3.43). Not more than 12.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 30 volumes of *water* and 70 volumes of *methanol.*

Test solution. Weigh accurately a quantity of the powder containing 50 mg of Nelfinavir Mesylate, disperse in 50 ml of *0.1 M hydrochloric acid,* dilute to 250.0 ml with the solvent mixture and filter.

Reference solution. Dissolve 10 mg of *nelfinavir mesylate RS* in 10 ml of *0.1 M hydrochloric acid* and dilute to 50.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature 40°,
- mobile phase: a mixture of 35 volumes of a buffer solution prepared by dissolving 4 g of *sodium dihydrogen phosphate dihydrate* and 1g of *1-octane sulphonic acid sodium salt* into 1000 ml of *water*, adding 1ml of *dimethylamine* and filtering, 45 volumes *acetonitrile* and 20 volumes of *methanol*,
- flow rate. 2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume. 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency in not less than 2000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{32}H_{45}N_3O_4S$ in the oral powder.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of nelfinavir.

Nelfinavir Tablets

Nelfinavir Mesylate Tablets

Nelfinavir Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nelfinavir mesylate, $C_{32}H_{45}N_3O_4S,CH_4O_3S$.

Usual strengths. 250 mg; 625 mg.

Identification

A. Shake a quantity of the powdered tablets containing about 0.1 g of Nelfinavir Mesylate with 80 ml of *methanol* for 10 minutes, add sufficient *methanol* to produce 100 ml, mix and filter. Dilute 5 ml of the filtrate to 100 ml with *methanol*.

When examined in the range 200 nm to 300 nm the resulting solution shows an absorption maximum only at about 254 nm (2.4.7).

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1,

Medium. 900 ml of *0.01 M hydrochloric acid*,

Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc with an average pore diameter not greater than 1.0 µm. Reject the first few ml of the filtrate and dilute a suitable volume of the filtrate with the same solvent. Measure the absorbance of the resulting solution at the maximum at about 250 nm (2.4.7). Calculate the content of $C_{32}H_{45}N_3O_4S,CH_4O_3S$ from the absorbance of a solution of known concentration of *nelfinavir mesylate RS*.

D. Not less than 75 per cent of the stated amount of $C_{32}H_{45}N_3O_4S, CH_4O_3S$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh accurately a quantity of the powdered tablets containing about 100 mg of Nelfinavir Mesylate, add about 20 ml of *methanol*, mix with the aid of ultrasound for 10 minutes and dilute to 100 ml with the mobile phase.

Reference solution. Weigh accurately about 10 mg of *nelfinavir mesylate RS*, add about 10 ml of *methanol*, shake for 10 minutes and dilute to 50 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica particles or ceramic microparticles (5 µm),
- mobile phase: a filtered and degassed mixture of 45 volumes of *acetonitrile*, 20 volumes of *methanol* and 35 volumes of a buffer prepared by dissolving 4.0 g of *sodium dihydrogen phosphate* in 1000 ml of *water*, to which are added 1 ml of *dimethylamine solution* and 1 g of *sodium octanesulphonate* and mixing to dissolve,
- flow rate. 1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency determined from the nelfinavir mesylate peak is not less than 4000 theoretical plates and the tailing factor is not more than 2.0.

Inject separately the diluent (10 ml of *methanol* diluted to 50 ml with the mobile phase) and the test solution and continue the chromatography for 4 times the retention time of the principal peak. Examine the diluent chromatogram for any extraneous peaks and ignore the corresponding peaks observed in the chromatogram obtained with the test solution.

Any secondary peak observed in the chromatogram obtained with the test solution should not be more than 1.0 per cent

and the sum of the areas of all the secondary peaks should not be more than 2.0 per cent when calculated by percentage area normalisation. Inhibit integration of peak due to methanesulphonic acid.

Other tests. Complies with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh accurately a quantity of the powdered tablets containing about 200 mg of Nelfinavir Mesylate, add about 20 ml of *methanol*, mix with the aid of ultrasound for 10 minutes and dilute to 100.0 ml with the mobile phase. Filter through a membrane filter disc with an average pore diameter not greater than 1.0 µm, rejecting the first few ml of the filtrate. Further dilute 5.0 ml of the filtrate to 100.0 ml with the mobile phase.

Reference solution. Weigh accurately about 50 mg of *nelfinavir mesylate RS*, add about 10 ml of *methanol*, mix with the aid of ultrasound to dissolve and dilute to 50.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 50.0 ml with the mobile phase.

Use the chromatographic system described in the test for Related substances.

Inject the reference solution. The test is not valid unless the column efficiency determined from the nelfinavir mesylate peak is not less than 5000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject separately the test solution and the reference solution and measure the responses for the major peak. Calculate the content of $C_{32}H_{45}N_3O_4S,CH_4O_3S$ in the tablets.

Storage. Store protected from light.

Neomycin Sulphate

Neomycin Sulphate is a mixture of the sulphates of substances obtained by the growth of certain selected strains of *Streptomyces fradiae*.

Neomycin Sulphate has a potency of not less than 600 Units per mg, calculated on the dried basis.

Category. Antibacterial (topical and systemic).

Dose. 1 g every 4 hours.

Description. A white or yellowish-white powder; odourless or almost odourless; hygroscopic.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H.*

Mobile phase. A freshly prepared 3.85 per cent w/v solution of *ammonium acetate.*

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of *water.*

Reference solution. A 2.0 per cent w/v solution of *neomycin sulphate RS* in *water.*

Apply to the plate 1 µl of each solution. After development, dry the plate in air for 10 minutes, heat at 100° for 1 hour and spray with a 0.1 per cent w/v solution of *ninhydrin* in *1-butanol* saturated with *water*. Heat again at 100° for 5 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. Dissolve about 10 mg in 5 ml of *water*, add 0.1 ml of *pyridine* and 2 ml of a 0.1 per cent w/v solution of *ninhydrin* and heat on a water-bath at a temperature of about 70° for 10 minutes; a deep violet colour is produced.

C. A 5 per cent w/v solution gives the reactions of sulphates (2.3.1).

Tests

pH (2.4.24). 5.0 to 7.5, determined in a 1.0 per cent w/v solution.

Specific optical rotation (2.4.22).+53.5° to +59.0°, determined in a 10.0 per cent w/v solution.

Neamine. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H.*

Mobile phase. A mixture of 30 volumes of *methanol*, 20 volumes of *strong ammonia solution* and 10 volumes of *dichloromethane.*

Test solution. Dissolve 0.25 g of the substance under examination in 10 ml of *water.*

Reference solution. A 0.05 per cent w/v solution of *neamine RS* in *water.*

Apply to the plate as 5-mm bands 5 µl of each solution. Dry the bands; allow the mobile phase to rise at least 8 cm. Dry the plate in a current of warm air, heat at 110° for 10 minutes, spray the plate with *ninhydrin and stannous chloride reagent* and heat at 110° for 15 minutes. Spray the plate again with the same reagent and heat at 110° for 15 minutes. Any band corresponding to neamine in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Neomycin C. Determine by thin-layer chromatography (2.4.17), coating the plate with silica gel of a suitable grade.

Mobile phase. A mixture of 80 volumes of a 20 per cent w/v solution of *sodium chloride* and 20 volumes of *methanol.*

Test solution. Dissolve 40 mg of the substance under examination in water and dilute to 5 ml with the same solvent.

Reference solution (a). Dissolve 30 mg of *framycetin sulphate RS* in *water* and dilute to 25 ml with the same solvent.

Reference solution (b). Dilute 5 ml of reference solution (a) to 25 ml with *water.*

Reference solution (c). Dissolve 40 mg of *neomycin sulphate RS* in *water* and dilute to 5 ml with the same solvent.

Apply to the plate as 5 mm bands 5 µl of each solution. Dry the bands; allow the mobile phase to rise at least 12 cm. Dry the plate at 100° to 105° for 10 minutes. Spray the plate with *ethanolic ninhydrin solution* and heat at 100° to 105° for 10 minutes. In the chromatogram obtained with the test solution the principal band corresponds to the principal band in the chromatogram obtained with reference solution (c) and the band due to neomycin C with R_f value slightly less than that of the principal band is not more intense than the band obtained with reference solution (a) (15 per cent) but is more intense than the band in the chromatogram obtained with reference solution (b) (3 per cent). The test is not valid unless in the chromatogram obtained with reference solution (c) a band appears with R_f value slightly less than that of the principal band.

Sulphated ash (2.3.18). Not more than 1.0 per cent.

Loss on drying (2.4.19). Not more than 8.0 per cent, determined on 0.5 g by drying in an oven at 60° over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa for 3 hours.

Assay. Determine by the microbiological assay of antibiotics, Method A (2.2.10).

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of Units of neomycin per mg.

Neomycin Eye Drops

Neomycin Sulphate Eye Drops

Neomycin Sulphate Eye Drops are a sterile solution of Neomycin Sulphate in Purified Water.

Neomycin Sulphate Eye Drops contain not less than 90.0 per cent and not more than 115.0 per cent w/v of the stated amount of neomycin sulphate.

Usual strength. 0.5 per cent w/v (3500 Units per ml).

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel.*

Mobile phase. A mixture of 60 volumes of *methanol,* 40 volumes of *strong ammonia solution* and 20 volumes of *chloroform.*

Test solution. Dilute if necessary a volume of the eye drops to produce a solution containing 0.5 per cent w/v of Neomycin Sulphate in *water.*

Reference solution (a). A 0.5 per cent w/v solution of *neomycin sulphate RS* in *water.*

Reference solution (b). A mixture of equal volumes of the eye drops and reference solution (a).

Apply to the plate 1 µl of each solution. After development, dry the plate in air, spray with a 1 per cent w/v solution of *ninhydrin* in *1-butanol* and heat at 105° for 2 minutes. The principal red spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a) and the principal red spot in the chromatogram obtained with reference solution (b) appears as a single spot.

Tests

Neamine. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H.*

Mobile phase. A mixture of 30 volumes of *methanol,* 20 volumes of *strong ammonia solution* and 10 volumes of *dichloromethane.*

Test solution. A volume of the eye drops containing 5 µg (3.5 Units).

Reference solution. The same volume of water containing 0.1 µg of *neamine RS.*

Apply to the plate each solution. After development, dry the plate in a current of warm air, heat at 110° for 10 minutes, spray the plate with *ninhydrin and stannous chloride reagent* and heat at 110° for 15 minutes. Spray the plate again with the same reagent and heat at 110° for 15 minutes. Any spot corresponding to neamine in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Neomycin C. Determine by liquid chromatography (2.4.14).

Test solution. Dilute the eye drops with *0.02 M borax* to contain 1 mg (700 Units) per ml. To 0.5 ml of the diluted solution add 1.5 ml of a freshly prepared 2 per cent w/v solution of *1-fluoro-2,4-dinitrobenzene* in *methanol,* dilute to 25 ml with the mobile phase, allow to stand and use the clear lower layer.

Reference solution. Add 1.5 ml of the 1-fluoro-2,4-dinitrobenzene solution to 0.5 ml of a 0.1 per cent w/v solution of *neomycin sulphate RS* in *0.02 M borax,* heat in a water-bath at 60° for 1 hour and cool; dilute the solution to 25 ml with the mobile phase, allow to stand and use the clear lower layer.

Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with porous silica particles (5 µm) (such as Nucleosil 100-5),
- mobile phase: a mixture of 97 ml of *tetrahydrofuran*, 1.0 ml of *water* and 0.5 ml of *glacial acetic acid* diluted with sufficient of a 2.0 per cent v/v solution of *ethanol* in *ethanol-free chloroform* to produce 250 ml,
- flow rate. 1.6 ml per minute,
- spectrophotometer set at 350 nm,
- injection volume. 10 µl.

If necessary the tetrahydrofuran and water content of the mobile phase may be adjusted so that the chromatogram obtained with the reference solution shows resolution similar to that in the specimen chromatogram supplied with *framycetin sulphate RS*. The mobile phase should be passed through the column for several hours before the solutions are injected. Continue the chromatography for 1.4 times the retention time of the peak due to neomycin B.

The column efficiency, determined using the peak due to Neomycin B in the chromatogram obtained with the test solution, should be not less than 13,000 theoretical plates.

In the chromatogram obtained with the test solution the area of the peak corresponding to neomycin C is not less than 3.0 per cent and not more than 15.0 per cent of sum of the areas of the peaks corresponding to Neomycin B and Neomycin C.

Other tests. Complies with the tests stated under Eye Drops.

Assay. Measure accurately a quantity containing 5 mg of Neomycin Sulphate and dilute to 50.0 ml with sterile *phosphate buffer pH 8.0* and mix. Dilute 10.0 ml of the resulting solution to 100.0 ml with the same solvent.

Determine by the microbiological assay of antibiotics, Method A (2.2.10)

The upper fiducial limit of error is not less than 90.0 per cent and the lower fiducial limit of error is not more than 115.0 per cent of the stated number of Units per ml.

Storage. Store protected from light.

Labelling. The strength is stated in terms of percentage w/v as well as the number of Units per ml.

Neomycin Eye Ointment

Neomycin Sulphate Eye Ointment

Neomycin Sulphate Eye Ointment is a sterile preparation containing Neomycin Sulphate in a suitable basis.

Neomycin Sulphate Eye Ointment contains not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of neomycin sulphate.

Usual strength. 0.5 per cent w/w (3500 Units per g).

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel*.

Mobile phase. A mixture of 60 volumes of *methanol*, 40 volumes of *strong ammonia solution* and 20 volumes of *chloroform*.

Test solution. Disperse a quantity of the eye ointment containing 20 mg of Neomycin Sulphate in 20 ml of *chloroform*, extract with 5 ml of *water* and use the aqueous extract.

Reference solution (a). A 0.4 per cent w/v solution of *neomycin sulphate RS* in *water*.

Reference solution (b). A mixture of equal volumes of test solution and reference solution (a).

Apply to the plate 1 µl of each solution. After development, dry the plate in air, spray with a 1 per cent w/v solution of *ninhydrin* in *1-butanol* and heat at 105° for 2 minutes. The principal red spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a) and the principal red spot in the chromatogram obtained with reference solution (b) appears as a single spot.

Tests

Neamine. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H*.

Mobile phase. A mixture of 30 volumes of *methanol*, 20 volumes of *strong ammonia solution* and 10 volumes of *dichloromethane*.

Test solution. Disperse a quantity of the eye ointment containing 20 mg of Neomycin Sulphate in 20 ml of *chloroform*, shake gently with 8 ml of *water*, allow the layers to separate and use the aqueous layer.

Reference solution. A 0.005 per cent w/v solution of *neamine RS* in *water*.

Apply to the plate 2 µl of each solution. After development, dry the plate in a current of warm air, heat at 110° for 10 minutes, spray with *ninhydrin and stannous chloride reagent* and heat at 110° for 15 minutes. Spray the plate again with the same reagent and heat at 110° for 15 minutes. Any spot corresponding to neamine in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Neomycin C. Determine by liquid chromatography (2.4.17)

Test solution. Disperse a quantity of the eye ointment containing 5 mg of Neomycin Sulphate in 20 ml of *light petroleum (120° to 160°)*, add 5 ml of *0.02 M borax*, shake, separate the aqueous layer and centrifuge. To 0.5 ml of the separated aqueous layer add 1.5 ml of a freshly prepared 2 per

cent w/v solution of *1-fluoro-2,4-dinitrobenzene* in *methanol*, heat on a water-bath at 60° for 1 hour and cool. Dilute the resulting solution to 25 ml with the mobile phase, allow to stand and use the clear lower layer.

Reference solution. Add 1.5 ml of the *1-fluoro-2,4-dinitrobenzene solution* to 0.5 ml of a 0.1 per cent w/v solution of *neomycin sulphate RS* in *0.02 M borax* and proceed as for the test solution.

Chromatographic system

- a stainless steel column 20 cm x 4.6 mm, packed with porous silica particles (5 µm),
- mobile phase: 97 ml of *tetrahydrofuran*, 1.0 ml of *water* and 0.5 ml of *glacial acetic acid* with sufficient of a 2.0 per cent v/v solution of *ethanol* in *ethanol-free chloroform* to produce 250 ml,
- flow rate. 1.6 ml per minute,
- spectrophotometer set at 350 nm,
- injection volume. 10 µl.

If necessary the tetrahydrofuran and water content of the mobile phase may be adjusted so that the chromatogram obtained with reference solution shows resolution similar to that in the specimen chromatogram supplied with *framycetin sulphate RS*. The mobile phase should be passed through the column for several hours before the solutions are injected. Continue the chromatography for 1.4 times the retention time of the peak due to neomycin B.

The column efficiency, determined using the peak due to Neomycin B in the chromatogram obtained with the test solution, should be not less than 13,000 theoretical plates.

In the chromatogram obtained with the test solution the area of the peak corresponding to neomycin C is not less than 3.0 per cent and not more than 15.0 per cent of the sum of the areas of the peaks corresponding to Neomycin B and Neomycin C.

Other tests. Complies with the tests stated under Eye Ointments.

Assay. Weigh accurately a quantity containing 5 mg of Neomycin Sulphate, dissolve in 25 ml of *chloroform*, extract with four quantities, each of 20 ml, of sterile *phosphate buffer pH 8.0*, combine the extracts and add sufficient of the buffer solution to produce 100.0 ml.

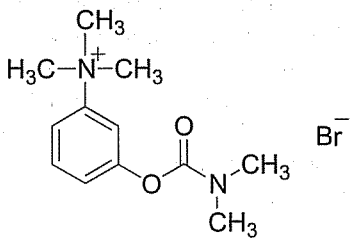
Carry out the microbiological assay of antibiotics, Method A (2.2.10).

The upper fiducial limit of error is not less than 90.0 per cent and the lower fiducial limit of error is not more than 115.0 per cent of the stated number of Units per g.

Storage. Store protected from light.

Labelling. The strength is stated in terms of percentage w/v as well as the number of Units per ml.

Neostigmine Bromide



$C_{12}H_{19}BrN_2O_2$ Mol. Wt. 303.2

Neostigmine Bromide is 3-(dimethylcarbamoyloxy) trimethylanilinium bromide.

Neostigmine Bromide contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{12}H_{19}BrN_2O_2$, calculated on the dried basis.

Category. Anticholinesterase.

Dose. 15 to 30 mg, repeated at suitable intervals; total daily dose, 75 to 300 mg.

Description. Colourless crystals or a white, crystalline powder; odourless; hygroscopic.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B, C and D may be omitted if tests A and E are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *neostigmine bromide RS*.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.02 per cent w/v solution in *0.5 M sulphuric acid* shows absorption maxima at about 260 nm and 266 nm.

C. Warm about 50 mg with 1 ml of *dilute sodium hydroxide solution*; an odour of dimethylamine develops slowly.

D. Warm about 50 mg with 0.4 g of *potassium hydroxide* and 2 ml of *ethanol (95 per cent)* on a water-bath for 3 minutes, replacing the evaporated *ethanol*. Cool, add 2 ml of *dilute diazobenzenesulphonic acid solution*; an orange-red colour is produced.

E. Gives the reactions of bromides (2.3.1).

Tests

Appearance of solution. A 0.5 per cent w/v solution is clear (2.4.1), and colourless (2.4.1).

Acidity. Dissolve 0.2 g in 20 ml of *carbon dioxide-free water* and titrate to pH 7.0 with *0.02 M sodium hydroxide* (carbonate-free); not more than 0.1 ml is required.

3-Hydroxytrimethylanilinium bromide. Dissolve 50 mg in a mixture of 1 ml of *sodium carbonate solution* and 9 ml of *water*. Absorbance of the resulting solution at about 294 nm, measured immediately after preparation, not more than 0.25 (2.4.7).

Sulphates (2.3.17). 0.75 g complies with the limit test for sulphates (200 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.5 g, dissolve in 20 ml of *anhydrous glacial acetic acid*, add 5 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03032 g of $C_{12}H_{19}BrN_2O_2$.

Storage. Store protected from light and moisture.

Neostigmine Tablets

Neostigmine Bromide Tablets

Neostigmine Bromide Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of neostigmine bromide, $C_{12}H_{19}BrN_2O_2$.

Usual strength. 15 mg.

Identification

Triturate a quantity of the powdered tablets containing about 0.3 g of Neostigmine Bromide with three quantities, each of 5 ml of *ether* and discard the ether. Macerate the residue with several quantities, each of 10 ml of *ethanol (95 per cent)*, filtering after each maceration. Evaporate the combined filtrates on a water-bath and dry the residue at 105° for 1 hour. The residue melts at about 167°, with decomposition. The residue complies with the following tests.

A. Warm about 50 mg with 0.4 g of *potassium hydroxide* and 2 ml of *ethanol (95 per cent)* on a water-bath for 3 minutes, replacing the evaporated *ethanol*. Cool, add 2 ml of *dilute diazobenzenesulphonic acid solution*; an orange-red colour is produced.

B. Gives the reactions of bromides (2.3.1).

Tests

Other tests. Complies with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 0.15 g of Neostigmine Bromide, transfer to a semi-micro ammonia-distillation apparatus, add 20 ml of a 50 per cent w/v solution of *sodium hydroxide* and 0.5 ml of a 2 per cent w/v solution of *2-octanol* in *liquid paraffin*. Pass a current of steam through the mixture, collect the distillate in 50 ml of *0.01 M sulphuric acid* until the volume is about 200 ml and titrate the excess of acid with *0.02 M sodium hydroxide* using *methyl red solution* as indicator. Repeat the operation without the substance under examination. The difference between the titrations represents the amount of sulphuric acid required to neutralise the dimethylamine produced.

1 ml of *0.01 M sulphuric acid* is equivalent to 0.006064 g of $C_{12}H_{19}BrN_2O_2$.

Storage. Store protected from light and moisture.

Neostigmine Methylsulphate

$C_{13}H_{22}N_2O_6S$ Mol. Wt. 334.4

Neostigmine Methylsulphate is 3-(dimethylcarbamoyloxy)-trimethylanilinium methyl sulphate.

Neostigmine Methylsulphate contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{13}H_{22}N_2O_6S$, calculated on the dried basis.

Category. Anticholinesterase.

Dose. By subcutaneous or intramuscular injection, 1 to 2.5 mg, repeated at suitable intervals; total daily dose, 5 to 20 mg.

Description. Colourless crystals or a white, crystalline powder; hygroscopic.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *neostigmine methylsulphate RS* or with the reference spectrum of neostigmine methylsulphate.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.05 per cent w/v solution in *0.5 M sulphuric acid* shows absorption maxima, at about 261 nm and 267 nm. The ratio of the absorbance at the maximum at about 267 nm to that at the maximum at 261 nm is 0.84 to 0.87.

C. Dissolve 0.1 g in 5 ml of *distilled water* and add 1 ml of a 6 per cent w/v solution of *barium chloride*; no precipitate is produced. Add 2 ml of *hydrochloric acid* and heat in a water-bath for 10 minutes; a white precipitate is produced.

D. Warm about 50 mg with 0.4 g of *potassium hydroxide* and 2 ml of *ethanol (95 per cent)* on a water-bath for 3 minutes,

replacing the evaporated *ethanol*. Cool, add 2 ml of *dilute diazobenzenesulphonic acid solution*; an orange-red colour is produced.

Tests

Appearance of solution. A 5.0 per cent w/v solution in *distilled water* is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. To 4.0 ml of a 5.0 per cent w/v solution in *distilled water* add 6.0 ml of *water* and 0.1 ml of *phenolphthalein solution*; the solution is colourless. Add 0.3 ml of *0.01 M sodium hydroxide*; the solution becomes red. Add 0.4 ml of *0.01 M hydrochloric acid*; the solution becomes colourless. Add 0.1 ml of *methyl red solution*; the solution becomes red or yellowish-red.

3-Hydroxytrimethylanilinium methyl sulphate. Dissolve 50 mg in a mixture of 1 ml of *sodium carbonate solution* and 9 ml of *water*. Absorbance of the resulting solution at about 294 nm, measured immediately after preparation, not more than 0.20 (2.4.7).

Chlorides (2.3.12). 1.0 g complies with the limit test for chlorides (250 ppm).

Sulphates (2.3.17). 0.75 g complies with the limit test for sulphates (200 ppm).

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Weigh accurately about 0.3 g and dissolve in 150 ml of *water*. Add 100 ml of *2 M sodium hydroxide*, distill and collect the distillate in 50 ml of a 4 per cent w/v solution of *boric acid* until a total volume of 250 ml is reached. Titrate the distillate with *0.1 M hydrochloric acid* using 0.25 ml of *methyl red-methylene blue solution* as indicator. Repeat the operation without the substance under examination. The difference between the titrations represents the amount of hydrochloric acid required.

1 ml of *0.1 M hydrochloric acid* is equivalent to 0.03344 g of $C_{13}H_{22}N_2O_6S$.

Storage. Store protected from light and moisture.

Neostigmine Injection

Neostigmine Methylsulphate Injection

Neostigmine Injection is a sterile solution of Neostigmine Methylsulphate in Water for Injections.

Neostigmine Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of neostigmine methylsulphate, $C_{13}H_{22}N_2O_6S$.

Usual strengths. 0.5 mg per ml; 2.5 mg per ml.

Identification

A. Dilute, if necessary, a volume of the injection containing 2.5 mg of Neostigmine Methylsulphate to 5 ml with *water*, shake with three quantities, each of 10 ml, of *ether* and discard the ether extracts.

When examined in the range 230 nm to 360 nm (2.4.7), a 2 cm layer of the resulting solution shows absorption maxima at about 260 nm and 267 nm.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 50 volumes of *chloroform*, 35 volumes of *methanol*, 10 volumes of *formic acid* and 5 volumes of *water*.

Test solution. Dilute the injection under examination, if necessary, with *water* to produce a solution containing 0.05 per cent w/v of Neostigmine Methylsulphate.

Reference solution (a). A 0.05 per cent w/v solution of *neostigmine methylsulphate RS* in *water*.

Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

Apply to the plate 10 µl of each solution. After development, dry the plate in air, spray with *dilute potassium iodobismuthate solution*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

C. To 1 ml add 0.5 ml of *sodium hydroxide solution* and evaporate to dryness on a water-bath. Heat quickly in an oil-bath to about 250° and maintain at this temperature for about 30 seconds. Cool, dissolve the residue in 1 ml of *water*, cool in ice water and add 1 ml of *diazobenzenesulphonic acid solution*; an orange-red colour is produced.

Tests

pH. (2.4.24) 4.5 to 6.5.

3-Hydroxy trimethylanilinium methyl sulphate. Determine by liquid chromatography (2.4.14).

Test solution. Dilute the injection if necessary, with *water* to contain a 0.05 per cent w/v solution of Neostigmine Methylsulphate.

Reference solution (a). Dilute 1 volume of the test solution to 100 volumes with *water*.

Reference solution (b). Add 0.05 ml of *5 M sodium hydroxide* to 1 ml of the test solution and allow to stand for 5 minutes. Add 0.1 ml of *5 M hydrochloric acid* and use immediately.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm packed with octadecylsilane chemically bonded to porous silica particles (5 µm) (such as Lichrosphere 60 RP-select B),
- mobile phase: *0.0015 M* solution of *sodium heptanesulphonate* in a mixture of 15 volumes of *acetonitrile* and 85 volumes of *0.05 M potassium dihydrogen orthophosphate* adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate. of 1.1 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume. 10 µl.

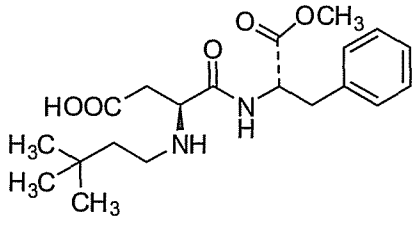
In the chromatogram obtained with reference solution (b) the principal peak has a retention time of about 6.8 minutes (neostigmine methylsulphate) and there is a peak with a relative retention time of about 0.5 (3-hydroxy) trimethylanilinium methylsulphate. In the chromatogram obtained with the test solution, the area of any secondary peak with a retention time corresponding to that of the peak due to (3-hydroxy)trimethylanilinium methylsulphate in the chromatogram obtained with reference solution (b) is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent).

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. Dilute an accurately measured volume containing about 25 mg of Neostigmine Methylsulphate to 50.0 ml with *water*. Measure the absorbance of the resulting solution at the maximum at about 260 nm (2.4.7). Calculate the content of $C_{13}H_{22}N_2O_6S$ taking 14.35 as the specific absorbance at 260 nm.

Storage. Store protected from light.

Neotame



$C_{20}H_{30}N_2O_5$ Mol.Wt. 378.4

Neotame is *N*-(3,3-dimethylbutyl)-L-α-aspartyl-L-phenylalanine 2-methyl ester.

Neotame contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{20}H_{30}N_2O_5$, calculated on the dried basis.

Category. Non-nutritive sweetener.

Description. A white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *neotame RS* or with the reference spectrum of neotame.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). –40° to –43.4°, determined in a 0.5 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 100 mg of substance under examination in 50.0 ml of the mobile phase.

Reference solution (a). A 0.002 per cent w/v solution of *neotame RS* in the mobile phase.

Reference solution (b). A 0.003 per cent w/v solution of *neotame impurity A RS* in the mobile phase.

Use the chromatographic system as described under Assay.

Inject reference solution (b). The test is not valid unless the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the test solution and reference solution (a). In the chromatogram obtained with the test solution, the area of peak corresponding to neotame impurity A is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent) and the sum of the areas of all other secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent).

Loss on ignition (2.4.20). Not more than 0.2 per cent.

Water (2.3.43). Not more than 5.0 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of substance under examination in 25.0 ml of mobile phase. Dilute 5.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution. A 0.1 per cent w/v solution of *neotame RS* in the mobile phase.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),

- column temperature. 45°,
- mobile phase: dissolve 3 gm of *sodium 1-heptanesulphonate* and 3.8 ml of *triethylamine* in 750 ml of *water*, adjust the pH to 3.5 with *orthophosphoric acid*. Add 250 ml of *acetonitrile*, adjust the pH to 3.7 with *orthophosphoric acid*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume. 20 µl.

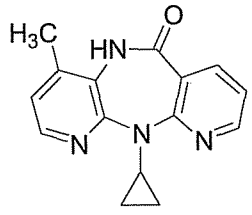
Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{20}H_{30}N_2O_5$.

Storage. Store protected from moisture.

Nevirapine



$C_{15}H_{14}N_4O$ Mol. Wt. 266.3

Nevirapine is 11-cyclopropyl-5,11-dihydro-4-methy-6*H*-dipyrido[3,2-*b*:2′,3′-*e*][1,4]diazepin-6-one.

Nevirapine contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{15}H_{14}N_4O$, calculated on the dried basis.

Category. Antiretroviral.

Dose. 200 mg once or twice daily.

Description. A white or almost white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nevirapine RS* or with the reference spectrum of nevirapine.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in 100 ml of *methanol.*

Reference solution. Dilute 1 ml of the test solution to 100 ml with *methanol.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica or ceramic microparticles (5 µm),
- mobile phase: a filtered and degassed mixture of 20 volumes of *methanol*, 20 volumes of *acetonitrile* and 60 volumes of a buffer prepared by dissolving 12.0 g of *sodium dihydrogen phosphate* in about 800 ml of *water*, adjusting the pH to 3.0 with *phosphoric acid* and diluting to 1000.0 ml with *water,*
- flow rate. 1.2 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency determined from the nevirapine peak is not less than 5000 theoretical plates and the tailing factor is not more than 2.0.

Separately inject the test solution and the reference solution. In the chromatogram obtained with the test solution, the area of any peak other than the principal peak is not greater than half of the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all such peaks is not greater than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying at 105° for 3 hours.

Assay: Determine by liquid chromatography (2.4.14).

Test solution. A 0.005 per cent w/v solution of the substance under examination in *methanol.*

Reference solution. A 0.005 per cent w/v solution of *nevirapine RS* in *methanol.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica or ceramic microparticles (5 µm),
- mobile phase: a filtered and degassed mixture of 20 volumes of *methanol*, 20 volumes of *acetonitrile* and 60 volumes of a buffer prepared by dissolving 12.0 g of *sodium dihydrogen phosphate* in about 800 ml of *water*, adjusting the pH to 3.0 with *orthophosphoric acid* and diluting to 1000.0 ml with *water,*

- flow rate. 1.2 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency determined from the nevirapine peak is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for the replicate injections is not more than 2.0 per cent.

Separately inject the test solution and the reference solution and measure the responses for the principal peak. Calculate the content of $C_{15}H_{14}N_4O$.

Storage. Store protected from moisture.

Nevirapine Oral Suspension

Nevirapine Oral Suspension is a suspension of Nevirapine in a suitable flavoured vehicle.

Nevirapine Oral Suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nevirapine, $C_{15}H_{14}N_4O$.

Usual strength. 50 mg in 5 ml.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 40 volumes of *1-butanol*, 30 volumes of *heptane*, 30 volumes of *acetone* and 10 volumes of *strong ammonia solution*.

Test solution. Dilute the preparation under examination with *methanol* to obtain a solution containing 1 mg of Nevirapine per ml.

Reference solution. A 0.1 per cent w/v solution of *nevirapine RS* in a mixture of 75 volumes of *methanol* and 25 volumes of *water*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 5.0 to 7.0.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. To an accurately measured volume of the preparation under examination containing about 25 mg of Nevirapine add about 10 ml of *methanol*, mix with the aid of ultrasound for 10 minutes, dilute to 50 ml with *water*, mix and filter.

Reference solution. Weigh accurately about 25 mg of *nevirapine RS*, add about 10 ml of *methanol*, mix with the aid of ultrasound to dissolve and dilute to 50 ml with *water*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilyl silica gel for chromatography (5 µm) (Such as Hypersil C8),
- mobile phase: A. *0.1 M ammonium acetate*, B. *methanol*,
- flow rate. 1 ml per minute,
- a linear gradient programme using the conditions given below,
- spectrophotometer set at 270 nm,
- injection volume. 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	95	5
5	95	5
25	20	80
30	20	80
31	95	5
40	95	5

Inject the reference solution. The test is not valid unless the column efficiency determined from the nevirapine peak is not less than 3000 theoretical plates and the tailing factor is not more than 2.0.

Inject separately the diluent (dilute 10 ml of *methanol* to 50 ml with *water*) and the test solution. Examine the diluent chromatogram for any extraneous peaks and ignore the corresponding peaks observed in the chromatogram obtained with the test solution. Ignore any peaks due to preservatives also.

Any secondary peak observed in the chromatogram obtained with the test solution should not be more than 1.0 per cent and the sum of the areas of all the secondary peaks should not be more than 2.0 per cent when calculated by percentage area normalisation.

Other tests. Comply with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh accurately a quantity of the preparation under examination containing 25 mg of Nevirapine, add about 10 ml of *methanol*, mix with the aid of ultrasound for 10 minutes, dilute to 50.0 ml with *water*, mix and filter. Further dilute 10.0 ml of the filtrate to 25.0 ml with *water*.

Reference solution. Weigh accurately about 50 mg of *nevirapine RS,* add about 20 ml of *methanol,* mix with the aid of ultrasound to dissolve and dilute to 100.0 ml with *water.* Dilute 10.0 ml of this solution to 25.0 ml with *water.*

Use the chromatographic system described under the test for Related substances.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject separately the test solution and the reference solution and measure the responses for the principal peak.

Determine the weight per ml of the oral suspension (2.4.29) and calculate the content of $C_{15}H_{14}N_4O$ weight in volume.

Storage. Store protected from light.

Nevirapine Tablets

Nevirapine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nevirapine, $C_{15}H_{14}N_4O$.

Usual strength. 200 mg.

Identification

A. When examined in the range 200 nm to 400 nm (2.4.7) a 0.001 per cent w/v solution in the mobile phase described under Assay, shows an absorption maximum at about 230 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Dissolution (2.5.2).
Apparatus No. 1,
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter disc with an average pore diameter not greater than 1.0 µm, rejecting the first few ml of the filtrate. Dilute suitably, if necessary. Measure the absorbance of the resulting solution, at the maximum at about 313 nm (2.4.7).

Calculate the content of $C_{15}H_{14}N_4O$ from the absorbance obtained from a solution of known concentration of *nevirapine RS* in *0.1 M hydrochloric acid.*

D. Not less than 70 per cent of the stated amount of $C_{15}H_{14}N_4O$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the powdered tablets with a suitable quantity of the mobile phase to obtain a mixture containing 0.05 per cent w/v of Nevirapine and filter through a membrane filter disc with an average diameter not exceeding 1.0 µm, rejecting the first few ml of the filtrate.

Reference solution. A 0.05 per cent w/v solution of *nevirapine RS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica or ceramic microparticles (5 µm),
- mobile phase: a filtered and degassed mixture of 20 volumes of *methanol,* 20 volumes of *acetonitrile* and 60 volumes of a buffer prepared by dissolving 12.0 g of *sodium dihydrogen phosphate* in about 800 ml of *water,* adjusting the pH to 3.0 with *orthophosphoric acid* and diluting to 1000.0 ml with *water,*
- flow rate. 1.2 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency determined from the nevirapine peak is not less than 7500 theoretical plates and the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2 per cent.

Inject the test solution and continue the chromatography for at least five times the retention time of the principal peak. Determine the amount of related substances by the area normalisation method. Any individual impurity is not more than 1.0 per cent and the sum of all impurities is not more than 2.0 per cent.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Shake a quantity of powder containing about 100 mg of Nevirapine with sufficient of the mobile phase to obtain a mixture containing 0.05 per cent w/v of Nevirapine. Mix and filter through a membrane filter disc with an average pore diameter not greater than 1.0 µm, rejecting the first few ml of the filtrate.

Reference solution. A 0.05 per cent w/v solution of *nevirapine RS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica or ceramic microparticles (5 µm),
- mobile phase: a filtered and degassed mixture of 20 volumes of *methanol,* 20 volumes of *acetonitrile* and 60 volumes of a buffer prepared by dissolving 12.0 g of *sodium dihydrogen phosphate* in about 800 ml of *water,* adjusting the pH to 3.0 with *phosphoric acid* and diluting to 1000.0 ml with *water,*

- flow rate. 1.2 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume. 20 µl.

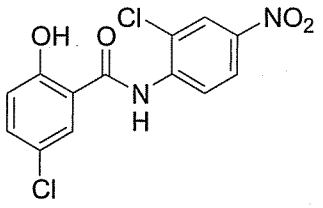
Inject the reference solution. The test is not valid unless the column efficiency determined from the nevirapine peak is not less than 7500 theoretical plates, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Separately inject the test solution and the reference solution and measure the responses for the principal peak. Calculate the content of $C_{15}H_{14}N_4O$ in the tablets.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Niclosamide

Anhydrous Niclosamide



$C_{13}H_8Cl_2N_2O_4$ Mol. Wt. 327.1

Niclosamide is 2′ ,5-dichloro-4′ -nitrosalicylanilide.

Niclosamide contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{13}H_8Cl_2N_2O_4$, calculated on the dried basis.

Category. Anthelmintic.

Dose. 2 g as a single dose after a light breakfast followed by a purgative 2 hours later.

Description. A yellowish white to yellowish, fine crystals or powder; odourless.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *niclosamide RS* or with the reference spectrum of niclosamide.

B. Heat 50 mg with 5 ml of *1 M hydrochloric acid* and 0.1 g of *zinc powder* in a water-bath for 10 minutes, cool and filter. To the filtrate add 1 ml of a 0.5 per cent w/v solution of *sodium nitrite* and allow to stand for 3 minutes. Add 2 ml of a 2 per cent w/v solution of *ammonium sulphamate*, shake, allow to stand for 3 minutes and add 2 ml of a 0.5 per cent w/v solution of N-*(1-naphthyl) ethylenediamine dihydrochloride*; a violet colour is produced.

C. Heat the substance under examination on a copper wire in a non-luminous flame; a green colour is imparted to the flame.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 50 ml of the *methanol*.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with *acetonitrile*. Dilute 1.0 ml of this solution to 20.0 ml with *acetonitrile*.

Chromatographic system

- a stainless steel column 12.5 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of *acetonitrile*, 50 volumes of a solution containing 0.2 per cent w/v of *potassium dihydrogen orthophosphate*, 0.1 per cent w/v of *disodium hydrogen phosphate* and 0.2 per cent w/v of *tetrabutylammonium hydrogen sulphate*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume. 20 µl.

Inject the reference solution. Adjust the sensitivity so that the height of the principal peak is not less than 20 per cent of full scale of the recorder.

Inject the test solution and the reference solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the sum of the areas of all the secondary peaks is not more than 4 times the area of the principle peak in the chromatogram obtained with the reference solution. Ignore any peak with an area less than 10 per cent of the area of the principal peak in the chromatogram obtained with the reference solution.

Chlorides (2.3.12). To 2.0 g add a mixture of 40 ml of *water* and 1.2 ml of *5 M acetic acid*, boil for 2 minutes, cool and filter; 10 ml of the filtrate diluted to 15 ml with *water* complies with the limit test for chlorides (500 ppm).

2-Chloro-4-nitroaniline. Not more than 100 ppm, determined by the following method. Boil 0.25 g with 5 ml of *methanol*, cool, add 45 ml of *1 M hydrochloric acid*, heat to boiling, cool, filter and dilute the filtrate to 50.0 ml with *1 M hydrochloric acid*. To 10.0 ml of this solution add 0.5 ml of a 0.5 per cent w/v solution of *sodium nitrite* and allow to stand for 3 minutes. Add 1.0 ml of a 2 per cent w/v solution of *ammonium sulphamate*, shake, allow to stand for 3 minutes

and add 1.0 ml of a 0.5 per cent w/v solution of N- *(1-naphthyl) ethylenediamine dihydrochloride*. Any pinkish violet colour produced is not more intense than that obtained in a solution prepared at the same time and in the same manner using 10.0 ml of a solution prepared by diluting 2.0 ml of a 0.00050 per cent w/v solution of *2-chloro-4-nitroaniline* in *methanol* to 20 ml with *1 M hydrochloric acid* and beginning at the words "add 0.5 ml of a 0.5 per cent w/v solution of *sodium nitrite*.....".

5-Chlorosalicylic acid. Not more than 60 ppm, determined by the following method. Boil 1.0 g with 15 ml of *water* for 2 minutes, cool, filter through a membrane filter (pore size 0.45 µm), wash the filter and dilute the combined filtrate and washings to 20 ml with *water* (solution A). Dissolve 30 mg of *5-chlorosalicylic acid* in 20 ml of *methanol* and add sufficient *water* to produce 100.0 ml. Dilute 1.0 ml of this solution to 100.0 ml with *water* (solution B). To 10.0 ml of each of solutions A and B add separately 0.1 ml of *ferric chloride solution*; any violet colour produced in solution A is not more intense than that obtained in solution B.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

Assay. Weigh accurately about 0.3 g, dissolve in 80 ml of a mixture of equal volumes of *acetone* and *methanol*. Titrate with *0.1 M tetrabutylammonium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.03271 g of $C_{13}H_8Cl_2N_2O_4$.

Storage. Store protected from light and moisture.

Niclosamide Tablets

Niclosamide Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of niclosamide, $C_{13}H_8Cl_2N_2O_4$. The tablets may contain sweetening and flavouring agents.

Usual strength. 500 mg.

Identification

Heat a quantity of the powdered tablets containing 0.5 g of Niclosamide with 25 ml of hot *ethanol (95 per cent)*, filter while hot and evaporate the filtrate to dryness on a water-bath. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *niclosamide RS* or with the reference spectrum of niclosamide.

B. Heat 50 mg with 5 ml of *1 M hydrochloric acid* and 0.1 g of *zinc powder* in a water-bath for 10 minutes, cool and filter. To the filtrate add 1 ml of a 0.5 per cent w/v solution of *sodium nitrite* and allow to stand for 3 minutes. Add 2 ml of a 2 per cent w/v solution of *ammonium sulphamate*, shake, allow to stand for 3 minutes and add 2 ml of a 0.5 per cent w/v solution of N- *(1-naphthyl) ethylenediamine dihydrochloride*; a violet colour is produced.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the powdered tablets containing about 100 mg of anhydrous nicolsamide with 80 ml of *methanol* for 15 minutes and dilute to 100.0 ml with the same solvent.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with *acetonitrile* and further dilute 1.0 ml of this solution to 20.0 ml with *acetonitrile*.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of *acetonitrile* and 50 volumes of a solution containing about 0.2 per cent w/v of *potassium dihydrogen orthophosphate*, 0.2 per cent w/v of *tetrabutylammonium hydrogen sulphate* and 0.1 per cent w/v of *disodium hydrogen orthophosphate*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume. 20 µl.

Inject the reference solution. Adjust the sensitivity so that the height of the principal peak is not less than 20 per cent of full scale of the recorder.

Inject the test solution and the reference solution. Run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the sum of the areas of all the secondary peaks is not more than 4 times the area of the principle peak in the chromatogram obtained with the reference solution. Ignore any peak with an area less than 10 per cent of the area of the principal peak in the chromatogram obtained with the reference solution.

2-Chloro-4-nitroaniline. Not more than 100 ppm, Boil a quantity of the powdered tablets containing 0.1 g of Niclosamide with 20 ml of *methanol* and 20 ml of a solution in *methanol* containing 10 µg of *2-chloro-4-nitroaniline*, cool, add 45 ml of *1 M hydrochloric acid*, heat to boiling, cool, filter and dilute the filtrate to 50.0 ml with *1 M hydrochloric acid*. To 10.0 ml of this solution add 0.5 ml of a 0.5 per cent w/v solution of *sodium nitrite* and allow to stand for 3 minutes.

Add 1.0 ml of a 2 per cent w/v solution of *ammonium sulphamate*, shake, allow to stand for 3 minutes and add 1.0 ml of a 0.5 per cent w/v solution of N-*(1-naphthyl) ethylenediamine dihydrochloride*. Any pinkish violet colour produced is not more intense than that obtained in a solution prepared at the same time and in the same manner using 10.0 ml of a solution prepared by diluting 2.0 ml of a 0.0005 per cent w/v solution of *2-chloro-4-nitroaniline* in *methanol* to 20.0 ml with *1 M hydrochloric acid* and beginning at the words "add 0.5 ml of a 0.5 per cent w/v solution of *sodium nitrite*.....".

5-Chlorosalicylic acid. Boil a quantity of the powdered tablets containing 0.5 g of Niclosamide with 10 ml of *water* for 2 minutes, cool, filter and to the filtrate add 0.2 ml of *ferric chloride solution*; no red or violet colour is produced.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powdered tablets containing about 0.3 g of Niclosamide dissolved in 60 ml of *dimethylformamide*. Titrate with *0.1 M tetrabutylammonium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

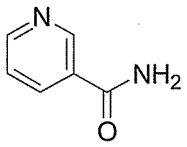
1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.03271 g of $C_{13}H_8Cl_2N_2O_4$.

Storage. Store protected from light and moisture.

Labelling. The label states that the tablets should be chewed thoroughly before swallowing.

Nicotinamide

Niâcinamide



$C_6H_6N_2O$ Mol. Wt. 122.1

Nicotinamide is pyridine-3-carboxamide.

Nicotinamide contains not less than 99.0 per cent and not more than 101.0 per cent of $C_6H_6N_2O$, calculated on the dried basis.

Category. B-group vitamin.

Dose. Orally, prophylactic, 15 to 30 mg daily; therapeutic, 50 to 250 mg daily. By intravenous injection, 50 to 250 mg daily.

Description. Colourless crystals or a white, crystalline powder; odour, faint and characteristic.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nicotinamide RS* or with the reference spectrum of nicotinamide.

B. Heat about 5 mg in a dry tube; pyridine is evolved.

C. Boil 0.1 g with 1 ml of *dilute sodium hydroxide solution*; ammonia is evolved.

D. To 2 ml of a 0.1 per cent w/v solution add 6 ml of *cyanogen bromide solution* and 1 ml of a 2.5 per cent w/v solution of *aniline*; a golden yellow colour develops.

Tests

Appearance of solution. A 5.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and not more intensely coloured than reference solution BYS7 (2.4.1).

pH (2.4.24). 6.0 to 7.5, determined in a 5.0 per cent w/v solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 48 volumes of *chloroform*, 45 volumes of *ethanol* and 4 volumes of *water*.

Test solution. Dissolve 0.8 g of the substance under examination in 10 ml of *ethanol (50 per cent)*.

Reference solution. A 0.02 per cent w/v solution of the substance under examination in *ethanol (50 per cent)*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate in air and examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Heavy metals (2.3.13). Dissolve 0.67 g in 10 ml of *water*, 7.5 ml of *1 M hydrochloric acid* and sufficient *water* to produce 25 ml. The solution complies with the limit test for heavy metals, Method A (30 ppm).

Chlorides (2.3.12). 1.0 g complies with the limit test for chlorides (250 ppm).

Sulphates (2.3.17). 1.2 g complies with the limit test for sulphates (125 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* at a pressure of 1.5 to 2.7 kPa for 18 hours.

Assay. Weigh accurately about 0.25 g, dissolve in 20 ml of *anhydrous glacial acetic acid*, heating slightly if necessary. Add 5 ml of *acetic anhydride*. Titrate with *0.1 M perchloric*

acid, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01221 g of $C_6H_6N_2O$.

Storage. Store protected from moisture.

Nicotinamide Tablets

Niacinamide Tablets

Nicotinamide Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of nicotinamide, $C_6H_6N_2O$.

Usual strength. 50 mg.

Identification

Shake a quantity of the powdered tablets containing 0.2 g of Nicotinamide with 50 ml of *ethanol* for 15 minutes, filter and evaporate the filtrate to dryness on a water-bath. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nicotinamide RS* or with the reference spectrum of nicotinamide.

B. Boil 0.1 g with 1 ml of *dilute sodium hydroxide solution*; ammonia is evolved.

C. To 2 ml of a 0.1 per cent w/v solution add 6 ml of *cyanogen bromide solution* and 1 ml of a 2.5 per cent w/v solution of *aniline*; a golden yellow colour develops.

D. When examined in the range 230 nm to 360 nm (2.4.7), the solution obtained in the Assay shows an absorption maximum only at about 262 nm and two shoulders at about 258 nm and 269 nm.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 48 volumes of *chloroform*, 45 volumes of *ethanol* and 4 volumes of *water*.

Test solution. Shake a quantity of the powdered tablets containing 0.1 g of Nicotinamide with 15 ml of *ethanol* for 15 minutes, filter, evaporate to dryness on a water-bath and dissolve the residue as completely as possible in 1 ml of *ethanol*.

Reference solution. Dilute 1 volume of the test solution to 400 volumes with *ethanol*

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate in air and examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

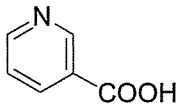
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 50 mg of Nicotinamide, shake with 50 ml of *ethanol (95 per cent)* for 15 minutes and dilute to 100.0 ml with *ethanol (95 per cent)*. Mix, filter, dilute 5.0 ml of the filtrate to 100.0 ml with *ethanol (95 per cent)* and measure the absorbance of the resulting solution at the maximum at about 262 nm (2.4.7). Calculate the content of $C_6H_6N_2O$ taking 241 as the specific absorbance at 262 nm.

Storage. Store protected from light and moisture.

Nicotinic Acid

Niacin



$C_6H_5NO_2$ Mol. Wt. 123.1

Nicotinic Acid is pyridine-3-carboxylic acid.

Nicotinic Acid contains not less than 99.5 per cent and not more than 100.5 per cent of $C_6H_5NO_2$, calculated on the dried basis.

Category. B-group vitamin.

Dose. Prophylactic, 15 to 30 mg daily; therapeutic, 50 to 250 mg daily.

Description. A white or creamy-white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nicotinic acid RS* or with the reference spectrum of nicotinic acid.

B. Heat a small quantity with twice its weight of *soda lime*; pyridine is evolved.

C. Dissolve about 50 mg in 20 ml of *water*, neutralise to *litmus paper* with *0.1 M sodium hydroxide*, add 3 ml of *copper sulphate solution*; a blue precipitate is gradually produced.

D. To 2 ml of a 0.1 per cent w/v solution add 6 ml of *cyanogen bromide solution* and 1 ml of a 2.5 per cent w/v solution of *aniline*; a golden yellow colour is produced.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 85 volumes of *1-propanol*, 10 volumes of *anhydrous formic acid* and 5 volumes of *water.*

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of *water.* Warm slightly, if necessary.

Reference solution. A 0.01 per cent w/v solution of the substance under examination in *water.*

Apply to the plate 5 µl of each solution. After development, dry the plate at 105° for 10 minutes and examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Heavy metals (2.3.13). Mix 1.0 g with 1.5 ml of *dilute hydrochloric acid* and sufficient *water* to produce 25 ml, heat gently and cool to room temperature. The resulting solution complies with the limit test for heavy metals, Method B (20 ppm).

Chlorides (2.3.12). 1.0 g complies with the limit test for chlorides (250 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 1 hour.

Assay. Weigh accurately about 0.25 g, dissolve in 50 ml of *carbon dioxide-free water* and titrate with *0.1 M sodium hydroxide* using *phenol red solution* as indicator. Repeat the operation without the substance under examination. The difference between the titrations represents the amount of sodium hydroxide required.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01231 g of $C_6H_5NO_2$.

Storage. Store protected from light and moisture.

Nicotinic Acid Tablets

Niacin Tablets

Nicotinic Acid Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of nicotinic acid, $C_6H_5NO_2$.

Usual strengths. 25 mg; 50 mg; 100 mg.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 48 volumes of *chloroform*, 45 volumes of *ethanol (95 per cent)* and 8 volumes of *water.*

Test solution. Shake a quantity of the powdered tablets containing 50 mg of Nicotinic Acid with 50 ml of hot *ethanol (95 per cent)*, filter and allow the filtrate to cool.

Reference solution. A 0.1 per cent w/v solution of *nicotinic acid RS* in *ethanol (95 per cent).*

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. Triturate a quantity of the powdered tablets containing 50 mg of Nicotinic Acid with 10 ml of *water* and filter. To 2 ml of the filtrate add 6 ml of *cyanogen bromide solution* and 1 ml of a 2.5 per cent w/v solution of *aniline*; a golden yellow precipitate is produced.

C. Shake a quantity of the powdered tablets containing 0.1 g of Nicotinic Acid with *ethanol (95 per cent)*, filter and evaporate the filtrate to dryness. Add to the residue 10 mg of *citric acid* and 0.15 ml of *acetic anhydride* and heat on a water-bath; a reddish-violet colour is produced.

Tests

Other tests. Comply with the tests stated under Tablets.

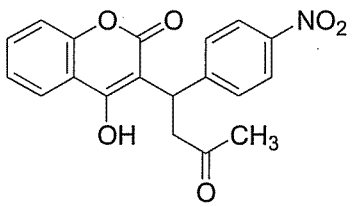
Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 0.25 g of Nicotinic Acid, add 40 ml of hot *ethanol (95 per cent)*, previously neutralised to *phenolphthalein solution*, and shake. Allow to stand for 15 minutes, swirling occasionally, and then shake for 10 minutes. Filter through a plug of cotton and wash the filter with *ethanol (95 per cent).* Add 50 ml of *carbon dioxide-free water* and titrate with *0.1 M sodium hydroxide* using *phenol red solution* as indicator.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01231 g of $C_6H_5NO_2$.

Storage. Store protected from light and moisture.

Nicoumalone

Acenocoumarol



$C_{19}H_{15}NO_6$ Mol. Wt. 353.3

Nicoumalone is (*RS*)-4-hydroxy-3-[1-(4-nitrophenyl)-3-oxobutyl]coumarin.

Nicoumalone contains not less than 98.5 per cent and not more than 100.5 per cent of $C_{19}H_{15}NO_6$, calculated on the dried basis.

Category. Anticoagulant.

Dose. Initial dose, first day, 8 to 12 mg; second day, 4 to 8 mg; maintenance dose, 1 to 8 mg daily.

Description. A white to brownish-white powder; odourless or almost odourless.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nicoumalone RS* or with the reference spectrum of nicoumalone.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in a mixture of 9 volumes of *methanol* and 1 volume of *1 M hydrochloric acid* shows absorption maxima at about 283 nm and 306 nm; absorbances at the maxima, about 0.65 and about 0.52, respectively.

C. Heat 50 mg with 2.5 ml of *glacial acetic acid*, 0.5 ml of *hydrochloric acid* and 0.2 g of *zinc powder* on a water-bath for 5 minutes, cool and filter. To the filtrate add 0.05 ml of *sodium nitrite solution* and add the mixture to 10 ml of a 1 per cent w/v solution of *2-naphthol* containing 3 ml of *5 M sodium hydroxide*; a bright red precipitate is produced.

Tests

Appearance of solution. A 2.0 per cent w/v solution in *acetone* is clear (2.4.1).

B. A 2.0 per cent w/v solution in *0.1 M sodium hydroxide* is clear (2.4.1), and yellow.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 50 volumes of *chloroform*, 50 volumes of *cyclohexane* and 20 volumes of *glacial acetic acid*.

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of *acetone*.

Reference solution. A 0.002 per cent w/v solution of the substance under examination in *acetone*.

Apply to the plate 20 µl of each solution. After development, dry the plate in air and immediately examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.75 g, dissolve in 50 ml of *acetone* and titrate with *0.1 M sodium hydroxide* using *bromothymol blue solution* as indicator. Repeat the operation without the substance under examination. The difference between the titrations represents the amount of sodium hydroxide required.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.03533 g of $C_{19}H_{15}NO_6$.

Storage. Store protected from light.

Nicoumalone Tablets

Acenocoumarol Tablets

Nicoumalone Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nicoumalone, $C_{19}H_{15}NO_6$.

Usual strengths. 1 mg; 2 mg; 3 mg; 4 mg.

Identification

A. Heat a quantity of the powdered tablets containing 50 mg of Nicoumalone with 30 ml of *acetone* under a reflux condenser for 5 minutes, filter and wash the residue with two quantities, each of 10 ml, of *acetone*. Evaporate the combined filtrate and washings to 5 ml, add *water* dropwise until the solution becomes turbid, heat on a water-bath until the solution is clear and allow to stand. Filter, wash the crystals with a mixture of equal volumes of *acetone* and *water* and dry at 100° at a pressure of 2 kPa for 30 minutes.

On the residue determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nicoumalone RS* or with the reference spectrum of nicoumalone.

B. When examined in the range 230 nm to 360 nm (2.4.7), the final solution obtained in the Assay shows absorption maxima at about 283 nm and 306 nm.

C. Heat 50 mg of the residue obtained in test A, with 2.5 ml of *glacial acetic acid*, 0.5 ml of *hydrochloric acid* and 0.2 g of *zinc powder* on a water-bath for 5 minutes, cool and filter. To the filtrate add 0.05 ml of *sodium nitrite solution* and add the mixture to 10 ml of a 1 per cent w/v solution of *2-naphthol* containing 3 ml of *5 M sodium hydroxide*; a bright red precipitate is produced.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 50 volumes of *chloroform*, 50 volumes of *cyclohexane* and 20 volumes of *glacial acetic acid*.

Test solution. Shake a quantity of the powdered tablets containing 20 mg of Nicoumalone with 5 ml of *acetone*, centrifuge and use the supernatant liquid.

Reference solution. Dilute 1 volume of the test solution to 200 volumes with *acetone*.

Apply to the plate 20 µl of each solution. After development, dry the plate in air and immediately examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Uniformity of content. Comply with the test stated under Tablets.

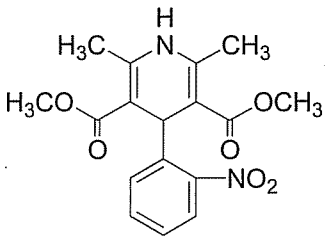
Finely crush one tablet, add 30 ml of *methanol*, stir the mixture for 30 minutes and filter through sintered glass, washing the residue with three quantities, each of 15 ml, of *methanol*. To the combined filtrate and washings add 10 ml of *1 M hydrochloric acid* and sufficient *methanol* to produce 100.0 ml. If necessary, dilute further with a solvent prepared by diluting 1 volume of *1 M hydrochloric acid* to 10 volumes with *methanol* to produce a solution containing about 0.001 per cent w/v solution of Nicoumalone. Measure the absorbance of the resulting solution at the maximum at about 306 nm (2.4.7). Calculate the content of $C_{19}H_{15}NO_6$ taking 521 as the specific absorbance at 306 nm.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 10 mg of Nicoumalone, add 30 ml of *methanol*, stir the mixture for 30 minutes and filter through sintered-glass, washing the residue with three quantities, each of 15 ml, of *methanol*. To the combined filtrate and washings add 10 ml of *1 M hydrochloric acid* and sufficient *methanol* to produce 100.0 ml. Dilute 5.0 ml of this solution to 50.0 ml with a solvent prepared by diluting 1 volume of *1 M hydrochloric acid* to 10 volumes with *methanol* and measure the absorbance of the resulting solution at the maximum at about 306 nm (2.4.7). Calculate the content of $C_{19}H_{15}NO_6$ taking 521 as the specific absorbance at 306 nm.

Storage. Store protected from light and moisture.

Nifedipine



$C_{17}H_{18}N_2O_6$ Mol. Wt. 346.3

Nifedipine is dimethyl 1,4-dihydro-2,6-dimethyl-4-(2-nitrophenyl)pyridine-3,5-dicarboxylate.

Nifedipine contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{17}H_{18}N_2O_6$, calculated on the dried basis.

Category. Antianginal (calcium channel blocker).

Dose. Initial dose, 5-20 mg daily, in divided doses; subsequent doses, in accordance with the needs of the patient but total daily dose not to exceed 100 mg.

Description. A yellow, crystalline powder; readily affected by exposure to light.

NOTE— Nifedipine, when exposed to daylight and certain wavelengths of artificial light, readily converts to a nitrosophenyl derivative. Exposure to ultraviolet light leads to the formation of a nitrophenyl derivative. Perform the tests and assay in the dark or under long-wavelength light (greater than 420 nm). Use low-actinic glassware.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nifedipine RS* or with the reference spectrum of nifedipine.

B. In the test for Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to nifedipine in the chromatogram obtained with the reference solution (a).

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 60 volumes of *cyclohexane* and 40 volumes of *ethyl acetate*.

Test solution. Dissolve 0.1 g of the substance under examination in 100 ml of *methanol*.

Reference solution. A 0.1 per cent w/v solution of *nifedipine RS* in *methanol.*

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

D. To 25 mg add 10 ml of a mixture of 5 volumes of *ethanol (95 per cent)*, 3.5 volumes of *water* and 1.5 volumes of *hydrochloric acid* and dissolve with gentle heating. Add 0.5 g of granulated zinc and allow to stand for 5 minutes, swirling occasionally. Filter, add 5 ml of a 1 per cent w/v solution of *sodium nitrite* to the filtrate and allow to stand for 2 minutes. Add 2 ml of a 5 per cent w/v solution of *ammonium sulphamate*, shake vigorously with care and add 2 ml of a 0.5 per cent w/v solution of N-*(1- naphthyl) ethylenediamine dihydrochloride*; an intense red colour develops which persists for more than 5 minutes.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.2 g of the substance under examination in 20 ml of *methanol* and dilute to 50 ml with the mobile phase.

Reference solution (a). Dissolve an accurately weighed quantity of *nifedipine RS* in sufficient *methanol* to produce a 1.0 per cent w/v solution and dilute quantitatively with the mobile phase to obtain a 0.4 per cent w/v solution.

Reference solution (b). A 0.04 per cent w/v solution of *dimethyl-2,6-dimethyl-4-(2-nitrophenyl)pyridine-3,5-dicaboxylate RS* (nitrophenylpyridine analogue) in *methanol.*

Reference solution (c). A 0.04 per cent w/v solution of *dimethyl-2,6-dimethyl-4-(2-nitrosophenyl)pyridine-3,5-dicarboxylate RS* (nitroso- phenylpyridine analogue) in *methanol.*

Reference solution (d). Mix 1 volume of each of reference solutions (b) and (c) and 0.1 volume of the test solution, dilute to 10 volumes with the mobile phase and then dilute 2 volumes of the resulting solution to 10 volumes with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: 55 volumes of *water*, 36 volumes of *methanol* and 9 volumes of *acetonitrile,*
- flow rate. 1 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume. 20 µl.

Inject reference solution (d). The peaks appear in the order nitrophenylpyridine analogue, nitrosophenylpyridine analogue and nifedipine (retention time about 15.5 minutes). The test is not valid unless, in the chromatogram obtained with reference solution (d), (a) the resolution factor between the peaks due to the nitrophenylpyridine analogue and the nitrosophenylpyridine analogue is greater than 1.5, (b) the resolution between the peaks due to the nitrosophenylpyridine analogue and nifedipine is greater than 1.5, and (c) the height of the peak due to the nitrophenyl-pyridine analogue is at least 20 per cent of the full-scale deflection.

Inject the test solution and reference solutions (a) and (d) and record the chromatograms for twice the retention time of nifedipine. In the chromatogram obtained with the test solution no secondary peak other than any peaks corresponding to the nitrophenylpyridine analogue and the nitrosophenylpyridine analogue has an area greater than that of the peak due to nifedipine in the chromatogram obtained with reference solution (d) and the areas of any peaks corresponding to the nitrophenylpyridine analogue and the nitrosophenylpyridine analogue are not greater than the areas of the corresponding peaks in the chromatogram obtained with reference solution (d). The total amount of related substances is not greater than 0.3 per cent. Ignore any peak with an area less than 10 per cent of the area of the peak due to nifedipine in the chromatogram obtained with reference solution (d).

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

Assay. Weigh accurately about 0.13 g, dissolve in a mixture of 25 ml of *2-methyl-2-propanol* and 25 ml of *1 M perchloric acid* and titrate with *0.1 M ceric ammonium sulphate*, using 0.1 ml of *ferroin solution* as indicator until the pink colour is discharged, titrating slowly towards the end-point. Carry out a blank titration.

1 ml of *0.1 M ceric ammonium sulphate* is equivalent to 0.01732 g of $C_{17}H_{18}N_2O_6$.

Storage. Store protected from light.

Nifedipine Capsules

Nifedipine Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nifedipine, $C_{17}H_{18}N_2O_6$.

Usual strengths. 5 mg; 10 mg.

NOTE — Nifedipine, when exposed to daylight and certain wavelengths of artificial light, readily converts to a

nitrosophenyl derivative. Exposure to ultraviolet light leads to the formation of a nitrophenyl derivative. Perform the tests and assay in the dark or under long-wavelength light (greater than 420 nm). Use low-actinic glassware.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of equal volumes of *ethyl acetate* and *cyclohexane.*

Test solution. Transfer a quantity of the contents of the capsules containing 30 mg of Nifedipine into a centrifuge tube containing *0.1 M sodium hydroxide*, add 25 ml of *dichloromethane*, stopper the tube and shake gently for 1 hour. Centrifuge for 10 minutes at 2000 to 2500 rpm. Remove the supernatant aqueous layer by aspiration with a syringe and transfer 5 ml of the clarified lower layer to a suitable vial.

Reference solution (a). A 0.12 per cent w/v solution of *nifedipine RS* in *dichloromethane.*

Reference solution (b). A mixture of equal volumes of test solution and reference solution (a).

Apply to the plate 500 µl of each solution as bands 20 mm by 3 mm. After development, dry the plate in air until the solvent is not detectable and immediately examine in ultraviolet light at 254 nm. The principal band, appearing as a dark blue band, in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution (a). Spray with a solution prepared in the following manner. Dissolve 3 g of *bismuth subnitrate* and 30 g of *potassium iodide* in 10 ml of *3 M hydrochloric acid* and dilute with *water* to 100 ml; dilute 10 ml to 100 ml with *0.3 M hydrochloric acid.* In the chromatogram obtained with test solution the principal band, appearing as a compact light orange band against a yellow background, corresponds to that in the chromatogram obtained with reference solution (a). The band obtained with reference solution (b) appears as a single band under both visualisation procedures.

Tests

Uniformity of content. Comply with the test stated under Capsules.

Transfer the contents of a capsule quantitatively to a 200-ml volumetric flask with the aid of *methanol*, dilute to volume with *methanol* and mix. Complete the Assay beginning at the words "Measure the absorbance...." and calculate the content of $C_{17}H_{18}N_2O_6$ in the capsule.

Other tests. Comply with the tests stated under Capsules.

Assay. Transfer the contents of 5 capsules containing about 50 mg of Nifedipine quantitatively to a 200-ml volumetric flask with the aid of small quantities of *methanol.* Dilute to volume with *methanol* and mix. To 20.0 ml add sufficient *methanol* to produce 100.0 ml and mix. Measure the absorbance of the resulting solution at the maximum at about 350 nm (2.4.7). Calculate the content of $C_{17}H_{18}N_2O_6$ in the capsules from the absorbance obtained by repeating the operation with a 0.005 per cent w/v solution of *nifedipine RS* in *methanol.*

Storage. Store protected from light.

Nifedipine Sustained-release Tablets

Nifedipine Sustained-release Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nifedipine, $C_{17}H_{18}N_2O_6$.

NOTE — Nifedipine, when exposed to daylight and certain wavelengths of artificial light, readily converts to a nitrosophenyl derivative. Exposure to ultraviolet light leads to the formation of a nitrophenyl derivative. Perform the tests and the assay in the dark or under long-wavelength light (greater than 420 nm). Use low-actinic glassware.

Usual strengths. 10 mg; 20 mg.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of equal volumes of *ethyl acetate* and *cyclohexane.*

Test solution. Transfer a quantity of the powdered tablets containing 30 mg of Nifedipine into a centrifuge tube containing *0.1 M sodium hydroxide*, add 25 ml of *dichloromethane*, stopper the tube and shake gently for 1 hour. Centrifuge for 10 minutes at 2000 rpm to 2500 rpm. Remove the supernatant aqueous layer by aspiration with a syringe and use 5 ml of the clarified lower layer.

Reference solution. A 0.12 per cent w/v solution of *nifedipine RS* in *dichloromethane.*

Apply to the plate 500 µl of each solution as bands 20 mm by 3 mm. After development, dry the plate in air until the odour of the solvent is not detectable and immediately examine in ultraviolet light at 254 nm. The principal band, appearing as a dark blue band, in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution. Spray with a solution prepared in the following manner. Dissolve 3 g of *bismuth subnitrate* and 30 g of *potassium iodide* in 10 ml of *3 M hydrochloric acid* and dilute to 100 ml with *water*; dilute 10 ml of this solution to 100 ml with *0.3 M hydrochloric acid.* In the chromatogram obtained with the test solution the principal band, appearing

as a compact light orange band against a yellow background, corresponds to that in the chromatogram obtained with reference solution.

Tests

Dissolution (2.5.2).

A. Apparatus No. 1,
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 150 rpm and 120 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with the dissolution medium, if necessary, at the maximum at about 340 nm (2.4.7).

Calculate the content of $C_{17}H_{18}N_2O_6$ in the medium from the absorbance obtained from a solution of known concentration of *nifedipine RS* prepared by dissolving in minimum volume of *methanol* and then diluting with the dissolution medium.

D. Not less than 25 per cent and not more than 45 per cent of the stated amount of $C_{17}H_{18}N_2O_6$.

B. Apparatus No. 1,

Medium. 900 ml of phosphate buffer pH 6.8 prepared by dissolving 30 g of *sodium lauryl sulphate,* 24.8 g of *disodium hydrogen phosphate anhydrous,* 2.85 g of *citric acid monohydrate* and 0.75 ml of *orthophosphoric acid* in sufficient *water* to produce 6000 ml. Adjust the pH to 6.8, if necessary,

Replace *0.1 M hydrochloric acid* with phosphate buffer pH 6.8 and run the apparatus at 150 rpm for 6 hours. Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with the dissolution medium, if necessary, at the maximum at about 340 nm (2.4.7).

Calculate the content of $C_{17}H_{18}N_2O_6$ in the medium from the absorbance obtained from a solution of known concentration of *nifedipine RS* prepared by dissolving in minimum volume of *methanol* and then diluting with the dissolution medium.

D. Not less than 60 per cent of the stated amount of $C_{17}H_{18}N_2O_6$.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 25 mg of Nifedipine, disperse in *methanol*, shake and dilute to 100.0 ml with *methanol*, filter. Dilute 20.0 ml of the filtrate to 100.0 ml with *methanol*. Measure the absorbance of the resulting solution at the maximum at about 350 nm (2.4.7). Calculate the content of $C_{17}H_{18}N_2O_6$ from the absorbance obtained with a 0.005 per cent w/v solution of *nifedipine RS* in *methanol*.

Storage. Store protected from light and moisture.

Nifedipine Tablets

Nifedipine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nifedipine, $C_{17}H_{18}N_2O_6$. The tablets may be coated.

Usual strengths. 5 mg; 10 mg.

NOTE — Nifedipine, when exposed to daylight and certain wavelengths of artificial light, readily converts to a nitrosophenyl derivative. Exposure to ultraviolet light leads to the formation of a nitrophenyl derivative. Perform the tests and assay in the dark or under long-wavelength light (greater than 420 nm). Use low-actinic glassware.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of equal volumes of *ethyl acetate* and *cyclohexane.*

Test solution. Transfer a quantity of the powdered tablets containing 30 mg of Nifedipine to a centrifuge tube containing 20 ml of *0.1 M sodium hydroxide,* add 25 ml of *dichloromethane,* stopper the tube and shake gently for 1 hour. Centrifuge for 10 minutes at 2000 to 2500 rpm. Remove the supernatant aqueous layer by aspiration with a syringe and transfer 5.0 ml of the clarified lower layer to a suitable vial.

Reference solution (a). A 0.12 per cent w/v solution of *nifedipine RS* in *dichloromethane.*

Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

Apply to the plate 500 µl of each solution as bands 20 mm by 3 mm. After development, dry the plate in air until the solvent is not detectable and immediately examine in ultraviolet light at 254 nm. The principal band, appearing as a dark blue band, in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). Spray with a solution prepared in the following manner. Dissolve 3 g of *bismuth subnitrate* and 30 g of *potassium iodide* in 10 ml of *3 M hydrochloric acid* and dilute with *water* to 100 ml; dilute 10 ml to 100 ml with *0.3 M hydrochloric acid.* In the chromatogram obtained with the test solution the principal band, appearing as a compact light orange band against a yellow background, corresponds to that in the chromatogram obtained with reference solution (a). The band obtained with reference solution (b) appears as a single band under both visualisation procedures.

Tests

Uniformity of content. Comply with the test stated under Tablets

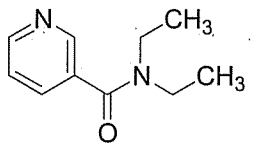
Shake one tablet with *methanol* in a 200-ml volumetric flask, dilute to volume with *methanol*, mix and filter. Complete the Assay beginning at the words "Measure the absorbance...." and calculate the content of $C_{17}H_{18}N_2O_6$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing 50 mg of Nifedipine into a 200 ml volumetric flask. Dissolve with the aid of 50 ml of *methanol*. Dilute to volume with *methanol*, mix and filter. Dilute 20 ml of the filtrate to 100 ml with *methanol* and mix. Measure the absorbance of the resulting solution at the maximum at about 350 nm (2.4.7). Calculate the content of $C_{17}H_{18}N_2O_6$ from the absorbance obtained by repeating the operation with a 0.005 per cent w/v solution of *nifedipine RS* in *methanol*.

Storage. Store protected from light and moisture.

Nikethamide



$C_{10}H_{14}N_2O$ Mol. Wt. 178.2

Nikethamide is *N,N*-diethylpyridine-3-carboxamide.

Nikethamide contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{10}H_{14}N_2O$, calculated on the anhydrous basis.

Category. CNS and Respiratory stimulant.

Dose. By slow intravenous injection, 500 mg to 2 g repeated at intervals of 15 to 30 minutes as necessary.

Description. A colourless or slightly yellowish, oily liquid or crystalline mass; odour, slight and characteristic.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests C and D may be omitted if tests A and B are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nikethamide RS* or with the reference spectrum of nikethamide.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.002 per cent w/v solution shows an absorption maximum only at about 263 nm; absorbance at about 263 nm, about 0.57.

C. Heat 0.1 g with 1 ml of *2 M sodium hydroxide*; diethylamine, recognisable by its odour, is evolved progressively; the fumes turn red litmus paper blue.

D. To 2 ml of a 0.1 per cent w/v solution add 2 ml of *cyanogen bromide solution* and 3 ml of a 2.5 per cent w/v solution of *aniline* and mix; a yellow colour is produced.

Tests

Appearance of solution. The substance, in liquid form or liquefied by gentle heating, is clear (2.4.1), and not more intensely coloured than reference solution YS5 (2.4.1).

pH (2.4.24). 6.0 to 7.8, determined in a 25.0 per cent w/v solution.

Congealing temperature (2.4.10). 23° to 24.5°.

Refractive index (2.4.27). 1.522 to1.526.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 75 volumes of *chloroform* and 25 volumes of *1-propanol*.

Test solution. Dissolve 0.4 g of the substance under examination in 10 ml of *methanol*.

Reference solution (a). A 0.04 per cent w/v solution of *ethylnicotinamide RS* in *methanol*.

Reference solution (b). A 0.004 per cent w/v solution of *ethylnicotinamide RS* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. Any spot corresponding to ethylnicotinamide in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (b).

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.3 per cent, determined on 2.0 g.

Assay. Weigh accurately about 0.15 g, dissolve in 20 ml of *anhydrous glacial acetic acid* and 5 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01782 g of $C_{10}H_{14}N_2O$.

Storge. Store protected from light.

Nikethamide Injection

Nikethamide Injection is a sterile solution containing 25 per cent w/v solution of Nikethamide in Water for Injections.

Nikethamide Injection contains not less than 24.0 per cent and not more than 26.0 per cent w/v solution of nikethamide, $C_{10}H_{14}N_2O$.

Identification

A. Make 1 ml alkaline with *5 M sodium hydroxide*, extract with 5 ml of *dichloromethane* and evaporate the solvent.

On the residue determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nikethamide RS* or with the reference spectrum of nikethamide.

B. Gives a voluminous precipitate with *alkaline potassium mercuri-iodide solution* and a greyish-brown flocculent precipitate with *tannic acid solution*. Gives no precipitate with *iodine solution* or with *potassium mercuri-iodide solution*.

C. Heat 1 ml with 0.2 g of *sodium hydroxide*; diethylamine, recognisable by its odour, is evolved.

Tests

pH (2.4.24). 6.0 to 8.0.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 75 volumes of *chloroform* and 25 volumes of *1-propanol*.

Test solution. Dilute 1 ml of the injection to 5 ml with *methanol*.

Reference solution (a). A 0.05 per cent w/v solution of *ethylnicotinamide RS* in *methanol*.

Reference solution (b). A 0.005 per cent w/v solution of *ethylnicotinamide RS* in *methanol*.

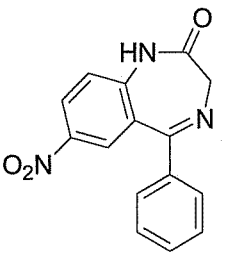
Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. Any spot corresponding to ethylnicotinamide in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (b).

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. Dilute 5.0 ml to 500.0 ml with *water*. To 5.0 ml of the solution add 5 ml of *1 M hydrochloric acid* and sufficient *water* to produce 500.0 ml. Measure the absorbance of the resulting solution at the maximum at about 263 nm (2.4.7). Calculate the content of $C_{10}H_{14}N_2O$ taking 282 as the specific absorbance at 263 nm.

Storage. Store protected from light, in single dose containers.

Nitrazepam



$C_{15}H_{11}N_3O_3$ Mol. Wt. 281.3

Nitrazepam is 1,3-dihydro-7-nitro-5-phenyl-2*H*-1,4-benzodiazepin-2-one.

Nitrazepam contains not less than 99.0 per cent and not more than 101.0 per cent $C_{15}H_{11}N_3O_3$, calculated on the dried basis.

Category. Hypnotic; sedative.

Dose. 5 to 10 mg daily, at bed time.

Description. A yellow, crystalline powder; odourless or almost odourless.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nitrazepam RS* or with the reference spectrum of nitrazepam.

B. *Carry out the following procedure in subdued light.*

When examined in the range 230 nm to 360 nm (2.4.7), a freshly prepared 0.0005 per cent w/v solution in a 0.5 per cent w/v solution of *sulphuric acid* in *methanol* shows an absorption maximum only at about 280 nm; absorbance at about 280 nm, about 0.45.

C. Dissolve 10 mg in 1 ml of *methanol*, warming if necessary, and add 0.05 ml of *2 M sodium hydroxide*; an intense yellow colour is produced.

D. Dissolve 20 mg in a mixture of 5 ml of *hydrochloric acid* and 10 ml of *water*, boil for 5 minutes, cool and add 2 ml of a 0.1 per cent w/v solution of *sodium nitrite*. Allow to stand for 1 minute, add 1 ml of a 0.5 per cent w/v solution of *sulphamic*

acid, mix, allow to stand for 1 minute, add 1 ml of a 0.1 per cent w/v solution of N-*(1-naphthyl)ethylenediamine dihydrochloride*; a red colour is produced.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 85 volumes of *nitromethane* and 15 volumes of *ethyl acetate*.

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of *acetone*.

Reference solution. A 0.002 per cent w/v solution of the substance under examination in *acetone*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in air and examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

Assay. Weigh accurately about 0.25 g, dissolve in 50 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02813 g of $C_{15}H_{11}N_3O_3$.

Storage. Store protected from light and moisture.

Nitrazepam Tablets

Nitrazepam Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nitrazepam, $C_{15}H_{11}N_3O_3$.

Usual strengths. 5 mg; 10 mg.

Identification

Carry out the following procedure in subdued light.

A. When examined in the range 230 nm to 360 nm (2.4.7), the final solution obtained in the Assay shows an absorption maximum only at about 280 nm.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 100 volumes of *chloroform* and 10 volumes of *methanol*.

Test solution. Shake a quantity of the powdered tablets with sufficient *methanol* to produce a solution containing 5 mg of Nitrazepam per ml, allow to settle and decant the supernatant liquid.

Reference solution. A 0.5 per cent w/v solution of *nitrazepam RS* in *methanol*.

Apply to the plate 2 µl of each solution. After development, dry the plate in air, spray it with *ethanolic sulphuric acid (10 per cent v/v)*, heat at 105° for 10 minutes and examine in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

C. To a quantity of the powdered tablets containing 5 mg of Nitrazepam add 5 ml of *hydrochloric acid* and 10 ml of *water*, heat on a water-bath for 15 minutes, filter and cool. To the clear filtrate add 1 ml of a 0.1 per cent w/v solution of *sodium nitrite*, allow to stand for 3 minutes and add 1 ml of a 0.5 per cent w/v solution of *sulphamic acid*. Allow to stand for 3 minutes and add 1 ml of a 0.1 per cent w/v solution of N-*(1-naphthyl) ethylenediamine dihydrochloride*; a red colour is produced.

Tests

Dissolution (2.5.2).

Apparatus No. 1,
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted if necessary, at the maximum at about 280 nm (2.4.7). Calculate the content of $C_{15}H_{11}N_3O_3$, in the medium from the absorbance obtained from a solution of known concentration of *nitrazapam RS* in the same medium.

D. Not less than 70 per cent of the stated amount of $C_{15}H_{11}N_3O_3$.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 40 volumes of *nitromethane*, 40 volumes of *toluene* and 20 volumes of *chloroform*.

Test solution. Shake a quantity of the powdered tablets containing 40 mg of Nitrazepam with 25 ml of *chloroform*, filter, carefully evaporate the filtrate to dryness and dissolve the residue in 2 ml of *chloroform*.

Reference solution. Dilute 1 volume of the test solution to 200 volumes with *chloroform*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in air and examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Uniformity of content. Comply with the test stated under Tablets.

NOTE — Carry out the following procedure in subdued light.

Powder 1 tablet, add 5 ml of *water*, mix and allow to stand for 15 minutes protected from light. Add 70 ml of a 0.5 per cent v/v solution of *hydrochloric acid* in *methanol*, shake for 15 minutes protected from light, add sufficient of the *hydrochloric acid solution* to produce 100.0 ml and filter. Dilute 10.0 ml of the filtrate with sufficient of the *hydrochloric acid solution* to produce a solution containing 0.0005 per cent w/v solution of Nitrazepam. Measure the absorbance of the resulting solution immediately at the maximum at about 280 nm (2.4.7). Calculate the content of $C_{15}H_{11}N_3O_3$ in the tablet taking 910 as the specific absorbance at 280 nm.

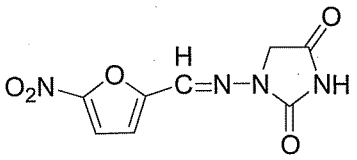
Other tests. Comply with the tests stated under Tablets.

Assay. *Carry out the following procedure in subdued light.*

Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 5 mg of Nitrazepam, add 5 ml of *water*, mix and allow to stand for 15 minutes protected from light. Add 70 ml of a 0.5 per cent v/v solution of *hydrochloric acid* in *methanol*, shake for 15 minutes protected from light, add sufficient of the *hydrochloric acid solution* to produce 100.0 ml and filter. Dilute 10.0 ml of the filtrate to 100.0 ml with the same solvent and measure the absorbance of the resulting solution immediately at the maximum at about 280 nm (2.4.7). Calculate the content of $C_{15}H_{11}N_3O_3$ taking 910 as the specific absorbance at 280 nm.

Storage. Store protected from light and moisture.

Nitrofurantoin



$C_8H_6N_4O_5$ Mol. Wt. 238.2 (anhydrous)

$C_8H_6N_4O_5,H_2O$ Mol. Wt. 256.2 (hydrous)

Nitrofurantoin is 1-(5-nitrofurfurylideneamino)imidazolidine-2,4-dione. It is anhydrous or contains one molecule of water of hydration.

Nitrofurantoin contains not less than 98.0 per cent and not more than 102.0 per cent of $C_8H_6N_4O_5$, calculated on the dried basis.

Category. Antibacterial.

Dose. 50 to 100 mg four times daily.

Description. Lemon yellow crystals or a crystalline powder; odourless or almost odourless.

Identification

Carry out the following test in subdued light.

A. When examined in the range 230 nm to 400 nm (2.4.7), the final solution obtained in the Assay shows absorption maxima at about 266 nm and 367 nm; the ratio of the absorbance at the maximum at about 367 nm to that at the maximum at about 266 nm is 1.36 to 1.42.

B. To 1 ml of a 0.1 per cent w/v solution in *dimethylformamide* add 0.1 ml of *0.5 M ethanolic potassium hydroxide*; a brown colour develops.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254*.

Mobile phase. A mixture of 90 volumes of *nitromethane* and 10 volumes of *methanol*.

Test solution. Dissolve 0.25 g of the substance under examination in minimum volume of *dimethylformamide* and dilute to 10 ml with *acetone*.

Reference solution. Dilute 1 volume of the test solution to 100 volumes with *acetone*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air, heat at 105° for 5 minutes and examine in ultraviolet light at 254 nm. Spray with *phenylhydrazine hydrochloride solution* and heat the plate at 105° for further 10 minutes. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution by both methods of visualisation.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). 5.0 to 7.1 per cent (hydrous form) and not more than 1.0 per cent (anhydrous form), determined on 1.0 g by drying in an oven at 105°.

Assay. *Carry out the following procedure in subdued light.*

Weigh accurately about 75 mg and dissolve in 25.0 ml of *dimethylformamide*, add sufficient *water* to produce 500.0 ml and mix. Dilute 5.0 ml to 100.0 ml with a solution containing 1.8 per cent w/v solution of *sodium acetate* and 0.14 per cent v/v of *glacial acetic acid*. Measure the absorbance of the

resulting solution at the maximum at about 367 nm (2.4.7), using as the blank the sodium acetate-acetic acid solution. Calculate the content of $C_8H_6N_4O_5$ taking 765 as the specific absorbance at 367 nm.

Storage. Store protected from light and moisture.

Labelling. The label states whether the material is anhydrous or hydrous.

Nitrofurantoin Tablets

Nitrofurantoin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nitrofurantoin, $C_8H_6N_4O_5$.

Usual strengths. 50 mg; 100 mg.

Identification

Carry out the following procedure in subdued light.

A. When examined in the range 230 nm to 400 nm (2.4.7), the final solution obtained in the Assay shows absorption maxima at about 266 nm and 367 nm.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254*.

Mobile phase. A mixture of 90 volumes of *nitromethane* and 10 volumes of *methanol*.

Test solution. Shake a quantity of the powdered tablets containing 0.1 g of Nitrofurantoin with 10 ml of a mixture of 9 volumes of *acetone* and 1 volume of *dimethylformamide* and filter.

Reference solution. Dilute 1 volume of the test solution to 100 volumes with *acetone*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air, heat at 105° for 5 minutes and examine in ultraviolet light at 254 nm. Spray with *phenylhydrazine hydrochloride solution* and heat the plate at 105° for further 10 minutes. Any secondary spot in the chromatogram obtained with the test solution, is not more intense than the spot in the chromatogram obtained with the reference solution by both methods of visualisation.

Other tests. Comply with the tests stated under Tablets.

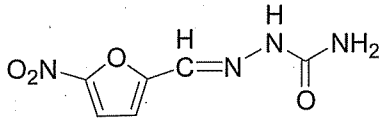
Assay. *Carry out the following procedure in subdued light.*

Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 0.15 g of Nitrofurantoin, add 50.0 ml of *dimethylformamide*, shake for 5 minutes, add sufficient *water* to produce 1000.0 ml and mix. Dilute 5.0 ml to 100.0 ml with a solution containing 1.8 per cent w/v solution of *sodium acetate* and 0.14 per cent v/v of *glacial acetic acid*. Measure the absorbance of the resulting solution at the maximum at about 367 nm (2.4.7), using as the blank the sodium acetate-acetic acid solution. Calculate the content of $C_8H_6N_4O_5$ taking 765 as the specific absorbance at 367 nm.

Storage. Store protected from light and moisture.

Nitrofurazone

Nitofural



$C_6H_6N_4O_4$ Mol. Wt. 198.1

Nitrofurazone is 5-nitro-2-furaldehyde semicarbazone.

Nitrofurazone contains not less than 97.0 per cent and not more than 103.0 per cent of $C_6H_6N_4O_4$, calculated on the dried basis.

Category. Antibacterial.

Description. A yellow to brownish-yellow, crystalline powder; odourless or almost odourless.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nitrofurazone RS* or with the reference spectrum of nitrofurazone.

B. Dissolve 1 mg in 1 ml of *dimethylformamide* and add 0.05 ml of *1 M ethanolic potassium hydroxide*; a ruby red colour is produced.

Tests

pH (2.4.24). 5.0 to 7.0, determined in the filtrate obtained by shaking 1.0 g with 100 ml of *carbon dioxide-free water* and filtering.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 100 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). A 0.0005 per cent w/v solution of *(5-nitro-2-furyl)methylene diacetate* (Nitrofurazone impurity B) in the mobile phase.

Reference solution (b). Dissolve 10 mg each of *nitrofural RS* and *nitrofurantoin* in 100 ml of the mobile phase. Dilute 5 ml of this solution to 100 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of *acetonitrile* and 60 volumes of *water*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 310 nm,
- injection volume. 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to nitrofural and nitrofurantoin is not less than 2.0.

Inject the test solution and reference solution (a). Run the chromatogram 10 times the retention time of nitrofural. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peaks with the area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.025 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. *Carry out the following procedure in subdued light.*

Weigh accurately about 60 mg, add 20.0 ml of *dimethylformamide*, swirl to dissolve and add sufficient *water* to produce 500.0 ml. Dilute 5.0 ml of the solution to 100.0 ml with *water* and mix. Measure the absorbance of the resulting solution at the maximum at about 375 nm (2.4.7). Calculate the content of $C_6H_6N_4O_4$ taking 822 as the specific absorbance at 375 nm.

Storage. Store protected from light and moisture.

Nitrous Oxide

N_2O Mol. Wt. 44.0

Nitrous Oxide contains not less than 98.0 per cent v/v of N_2O.

NOTE — Carry out the following tests on a full cylinder from which no gas has been withdrawn. The cylinder from which the gas is taken should be kept at room temperature for not less than 6 hours before carrying out the tests. Keep the cylinder in the vertical position with the outlet valve uppermost and deliver the gas at a rate of 4 litres per hour, unless otherwise directed. The test for Carbon monoxide should be carried out on the first portion of gas drawn from the cylinder and that for Nitric oxide and nitrogen dioxide immediately thereafter.

Category. General anaesthetic.

Dose. By inhalation, 60 to 80 per cent, with oxygen 20 to 40 per cent, as required.

Description. A colourless gas; odourless.

Identification

A. A glowing splinter of wood bursts into flame on contact with the gas.

B. Shake with *alkaline pyrogallol solution*; the gas being examined is not absorbed and the solution does not become brown.

Tests

Acidity or alkalinity. Use hermetically-closed, flat-bottomed, glass cylinders with dimensions such that 50 ml of liquid reaches a height of 12 to 14 cm, fitted with an outlet tube and with an inlet tube with an orifice of 1 mm in internal diameter reaching to within 2 mm of the bottom of the cylinder. For solution (1) pass 2.0 litres of the gas under examination through a mixture of 0.1 ml of *0.01 M hydrochloric acid* and 50 ml of *carbon dioxide-free water*. For solution (2) use 50 ml of *carbon dioxide-free water*. For solution (3) add 0.2 ml of *0.01 M hydrochloric acid* to 50 ml of *carbon dioxide-free water*. To each solution add 0.1 ml of a 0.02 per cent w/v solution of *methyl red* in *ethanol (70 per cent)*. The intensity of the colour of solution (1) is between those of solutions (2) and (3).

Arsine and phosphine. Through a *mercuric chloride paper* attached to a glass tube as in the limit test for arsenic (2.3.10), pass 2.0 litres of the gas; no visible stain is produced.

Carbon dioxide. Not more than 300 ppm v/v determined by the following method. Use the apparatus described in the test for Acidity or alkalinity. Pass 1.0 litre through 50 ml of clear *barium hydroxide solution*. Any turbidity produced in the resulting solution is not more than that obtained in a reference solution prepared at the same time by adding 1 ml of a 0.11 per cent w/v solution of *sodium bicarbonate* in *carbon dioxide-free water* to 50 ml of *barium hydroxide solution*.

Carbon monoxide. Not more than 10 ppm v/v, determined by the following method. Connect in series a U-tube containing *silica gel* impregnated with *chromium trioxide*, a drechsel bottle containing 100 ml of a 40 per cent w/v solution of *potassium hydroxide*, a U-tube containing pellets of *potassium hydroxide*, a U-tube containing *phosphorus pentoxide* dispersed on previously granulated, fused pumice, a tube containing *iodine pentoxide* in granules, previously dried at 200° and kept at a temperature of 120°, packed in 1-cm columns separated by 1-cm columns of glass wool giving an effective length of 5 cm, and a flask containing 2.0 ml of *1 M potassium iodide* and 0.15 ml of *starch solution*.

Flush the apparatus with 5.0 litres of carbon dioxide-free air and, if necessary, discharge the blue colour in the iodide solution by adding a small quantity of freshly prepared *0.002 M sodium thiosulphate*. Continue flushing until not more than 0.045 ml of *0.002 M sodium thiosulphate* is required after passing 5.0 litres of carbon dioxide-free air. Pass 5.0 litres of the gas under examination through the apparatus and flush the last traces of liberated iodine into the reaction flask by passing through the apparatus 1.0 litre of carbon monoxide-free air. Titrate the liberated iodine with *0.002 M sodium thiosulphate*. Carry out a blank titration under the same conditions, using 5.0 litres of carbon dioxide-free air. The difference between the volumes of *0.002 M sodium thiosulphate* used in the two titrations is not greater than 1.0 ml.

Halogens and hydrogen sulphide. Pass a volume containing 1.0 litre measured at 25° and at 101.3 kPa through a mixture of 100 ml of *water* and 1 ml of *silver nitrate solution*; neither opalescence nor darkening is produced.

Nitric oxide and nitrogen dioxide. Not more than 2 ppm v/v in both the liquid and gaseous phases, determined by the following method. Use two of the cylinders described in the test for Acidity or alkalinity connected in series. Examine separately both the liquid and gaseous phases of the gas under examination. To obtain the liquid phase invert the cylinder. The liquid vaporises on leaving the valve.

For solution A dissolve 1 g of *sulphanilic acid* in a mixture of 10 ml of *glacial acetic acid* and 180 ml of *water*. For solution B dissolve 0.2 g of *N-(1-naphthyl)ethylenediamine dihydrochloride* in 10 ml of a 50 per cent v/v solution of *glacial acetic acid*, heating gently, and dilute to 200 ml with *water*. Mix 9 volumes of solution A with 1 volume of solution B (reagent A).

In the first cylinder place 15 ml of a solution containing 2.5 per cent w/v solution of *potassium permanganate* and 1.2 per cent v/v of *sulphuric acid (96 per cent)*. Place 20 ml of reagent A in the second cylinder and connect the outlet tube of the first cylinder to the inlet tube of the second cylinder. Pass 2.5 litres of the gas under examination through the reagents at a rate of 15 litres per hour. Prepare a reference solution by adding 0.25 ml of a 0.00616 per cent w/v solution of *sodium nitrite* to 20 ml of reagent A. Allow both the sample and reference solutions to stand for 10 minutes. For both liquid and gaseous phases, any red colour in the sample solution is not more intense than that in the reference solution.

Oxidising substances. Pass a volume containing 2.0 litres measured at 25° and at 101.3 kPa through a freshly prepared solution of 0.5 g of *soluble starch* and 0.5 g of *potassium iodide* in 100 ml of *water* containing 0.05 ml of *glacial acetic acid*; the colour of the liquid is not changed.

Water. Pass a measured quantity at a rate of 6 litres per hour through an absorption tube containing *magnesium perchlorate*; the increase in weight of the tube does not exceed 2 mg per litre of gas, the initial and final weighings of the tube being made when the air in it has been displaced by the nitrous oxide.

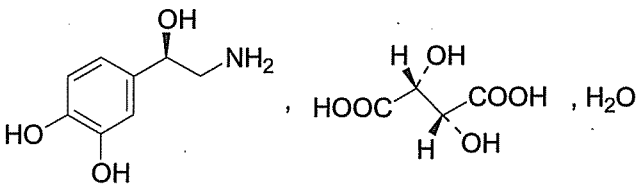
Assay. Carry out the assay of nitrous oxide (2.3.32), using 100 ml of the gas under examination. Use a cylinder of the gas under examination from which at least 1 per cent w/w of the contents have been removed.

Storage. Store under pressure in metal cylinders of the type conforming to the appropriate safety regulations and at a temperature not exceeding 37°.

Labelling. The cylinder is painted blue and carries a label stating "Nitrous Oxide". In addition, "Nitrous Oxide" or the symbol "N_2O" should be stencilled in paint on the shoulder of the cylinder.

Noradrenaline Bitartrate

Noradrenaline Acid Tartrate; Levarterenol Bitartrate; Norepinephrine Bitartrate



$C_8H_{11}NO_3,C_4H_6O_6,H_2O$ Mol. Wt. 337.3

Noradrenaline Bitartrate is (*R*)-2-amino-1-(3,4-dihydroxyphenyl)ethanol tartrate monohydrate.

Noradrenaline Bitartrate contains not less than 98.5 per cent and not more than 101.0 per cent of $C_8H_{11}NO_3,C_4H_6O_6$, calculated on the anhydrous basis.

Category. Sympathomimetic.

Dose. By intravenous infusion, 2 to 20 µg per minute, according to the blood pressure of the patient.

Description. A white or almost white, crystalline powder; odourless. It gradually darkens on exposure to air and light.

Identification

Test A may be omitted if tests B, C, D, E and F are carried out. Tests C, D, E may be omitted if tests A, B and F are carried out.

A. Dissolve 0.2 g in 2 ml of *water* containing about 10 mg of *sodium sulphite* and add sufficient *dilute ammonia solution* to give an alkaline reaction. Keep the mixture at about 4° for 1 hour and filter.

On the residue (residue R) determine by infrared absorption spectrophotometry (2,4,6). Compare the spectrum with that obtained with *noradrenaline acid tartrate RS* treated in the same manner.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.005 per cent w/v solution in *0.01 M hydrochloric acid* shows an absorption maximum at about 279 nm; absorbance at about 279 nm, about 0.40.

C. Wash residue R obtained in test A with three quantities, each of 2 ml, of *water*, followed by 5 ml of *ethanol (95 per cent)* and 5 ml of *ether* and dry the precipitate under pressure of 1.5 to 2.5 kPa for 3 hours. The specific optical rotation (2.4.22), determined in a 2.0 per cent w/v solution of the dried precipitate in *0.5 M hydrochloric acid* is –44° to –48°.

D. To 1 ml of a 1 per cent w/v solution, add 0.05 ml of *ferric chloride solution*; an intense green colour is produced. Add, drop by drop, *sodium bicarbonate solution*; the colour changes to blue and then red.

E. To 1 ml of a 0.1 per cent w/v solution add 10 ml of *phthalate buffer pH 3.6*, add 1 ml of *0.05 M iodine*, set aside for 5 minutes and add 2 ml of *0.1 M sodium thiosulphate*; not more than a faint red colour is produced. Repeat the test using *buffer solution pH 6.6* instead of *phthalate buffer pH 3.6*; a strong reddish violet colour is produced (distinction from adrenaline and isoprenaline).

F. The filtrate obtained in test A gives the reactions of tartrates (2.3.1).

Tests

Appearance of solution. A freshly prepared 2.0 per cent w/v solution is clear (2.4.1), and not more intensely coloured than reference solution BY*S5* (2.4.1).

pH (2.4.24). 3.5 to 5.0, determined in a 1.0 per cent w/v solution.

Melting range (2.4.21). 100° to 106°, with decomposition.

Adrenaline. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 50 volumes of *acetone*, 50 volumes of *dichloromethane* and 0.5 volume of *anhydrous formic acid*.

Prepare the following solutions immediately before use.

Test solution. Dissolve 0.25g of the substance under examination in 10 ml of *water*.

Reference solution (a). A 0.125 per cent w/v solution of *adrenaline tartrate RS* in *water*.

Reference solution (b). A 0.025 per cent w/v solution of *adrenaline tartrate RS* in *water*.

Reference solution (c). A mixture of equal volumes of the test solution and reference solution (b).

Apply to the plate 6 µl of each of test solution, reference solutions (a) and (b) and 12 µl of reference solution (c) as bands 20 mm by 2 mm. Allow the applied bands to dry in air, spray them with a saturated solution of *sodium bicarbonate*, allow to dry in air and spray the bands twice with *acetic anhydride*, drying between the two sprayings. Heat the plate at 50° for 90 minutes and develop the chromatograms. After removal of the plate, allow it to dry in air and spray with a freshly prepared mixture of 8 volumes of *methanol*, 2 volumes of *ethylenediamine* and 2 volumes of a 0.5 per cent w/v solution of *potassium ferricyanide*. Dry the plate at 60° for 10 minutes and examine in ultraviolet light at 254 and 365 nm. In the chromatogram obtained with the test solution any band with a slightly higher R_f value than the principal band is not more intense than the corresponding band in the chromatogram obtained with reference solution (b). The chromatogram obtained with reference solution (c) shows a clearly separated band corresponding to the most intense band in the chromatogram obtained with reference solution (a) at a higher R_f value than the most intense band.

Noradrenalone. Absorbance of a 0.2 per cent w/v solution in *0.01 M hydrochloric acid* at 310 nm, not more than 0.40 (2.4.7).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 4.5 to 5.8 per cent, determined on 0.5 g.

Assay. Weigh accurately about 0.6 g, dissolve in 50 ml of *anhydrous glacial acetic acid*, warming if necessary.Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator, until a bluish green colour is obtained. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03193 g of $C_8H_{11}NO_3,C_4H_6O_6$.

Storage. Store protected from moisture.

Noradrenaline Bitartrate Injection

Noradrenaline Acid Tartrate Injection; Noradrenaline Injection; Levarterenol Bitartrate Injection; Norepinephrine Bitartrate Injection

Noradrenaline Bitartrate Injection is a sterile solution of Noradrenaline Bitartrate. It is prepared by diluting Sterile Noradrenaline Concentrate to 250 times its volume with Sodium Chloride and Dextrose Injection or with Dextrose Injection (5 per cent w/v) immediately before use.

Noradrenaline Bitartrate Injection contains in 1 ml 8 µg of Noradrenaline Bitartrate equivalent to approximately 4 µg of noradrenaline.

Tests

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Sterile Noradrenaline Concentrate

Sterile Noradrenaline Concentrate is a sterile, isotonic solution containing 0.2 per cent w/v of Noradrenaline Bitartrate in Water for Injections.

Sterile Noradrenaline Concentrate contains not less than 0.18 per cent and not more than 0.23 per cent w/v of noradrenaline bitartrate, $C_8H_{11}NO_3,C_4H_6O_6,H_2O$.

Identification

Mix 0.5 ml with 10 ml of *phthalate buffer pH 3.6*, add 1 ml of *0.05 M iodine*, allow to stand for 5 minutes and add 2 ml of *0.1 M sodium thiosulphate*; not more than a very faint red colour is produced. Repeat the test using *phosphate buffer pH 6.6* instead of *phthalate buffer pH 3.6*; a strong reddish violet colour is produced.

Tests

pH (2.4.24). 3.0 to 4.6.

Other tests. Complies with the tests stated under Parenteral Preparations (Concentrated Solutions for Injection).

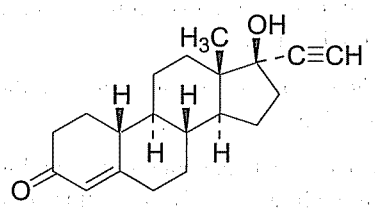
Assay. Dilute 5.0 ml to 200.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 279 nm (2.4.7). Calculate the content of $C_8H_{11}NO_3,C_4H_6O_6,H_2O$ taking 80 as the specific absorbance at 279 nm.

Storage. Store protected from light, in single dose containers.

Labelling. The label states (1) "Sterile Noradrenaline Concentrate"; (2) that 1 volume of the solution diluted to 250 volumes with Sodium Chloride and Dextrose Injection or with Dextrose Injection (5 per cent w/v) produces Noradrenaline Bitartrate Injection, which must be used immediately after preparation; (3) that if the solution is brown it should not be used.

Norethisterone

Norethindrone



$C_{20}H_{26}O_2$ Mol. Wt. 298.4

Norethisterone is 17β-hydroxy-19-nor-17α-pregn-4-en-20-yn-3-one.

Norethisterone contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{20}H_{26}O_2$, calculated on the dried basis.

Category. Progestogen.

Dose. 5 to 20 mg daily, in single or divided doses.

Description. A white or yellowish-white, crystalline powder; odourless.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *norethisterone RS* or with the reference spectrum of norethisterone.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. A mixture of 90 volumes of *acetone* and 10 volumes of *formamide*.

Mobile phase. A mixture of 40 volumes of *hexane* and 10 volumes of *dioxan*.

Test solution. Dissolve 10 mg of the substance under examination in 10 ml of *chloroform*.

Reference solution. Dissolve 10 mg of *norethisterone RS* in 10 ml of *chloroform*.

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to and exhibits fluorescence similar to that in the chromatogram obtained with the reference solution.

C. Dissolve about 2 mg in 2 ml of *ethanol (95 per cent)* and add 1 ml of a 1 per cent w/v solution of *butylated hydroxytoluene* in *ethanol (95 per cent)* and 2 ml of *1 M sodium hydroxide*. Heat in a water-bath for 30 minutes and cool; a yellowish pink colour is produced.

Tests

Appearance of solution. Dissolve 0.2 g in sufficient *dioxan* to produce 10 ml (solution A). The solution is clear (2.4.1), and not more intensely coloured than reference solution YS6 (2.4.1).

Specific optical rotation (2.4.22). –33.0° to –37.0°, determined in a solution prepared by diluting 5.0 ml of solution A to 10.0 ml with *dioxan*.

Light absorption. Dissolve 10 mg in sufficient *ethanol (95 per cent)* to produce 100 ml, dilute 10 ml of the solution to 100 ml with *methanol (98 per cent)*. Absorbance of the resulting solution at the maximum at about 240 nm, 0.55 to 0.59 (2.4.7).

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of 40 volumes of *water* and 60 volumes of *acetonitrile*.

Test solution. Dissolve 25 mg of the substance under examination in 10 ml of the solvent mixture.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of this solution to 10.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with end-capped octylsilane bonded to porous silica (5 µm),
- mobile phase: A. *water*,
  B. *acetonitrile*,
- a linear gradient programme using the condition given below,
- flow rate. 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Time (in min.)	Mobile phase A (per cent w/v)	Mobile phase B (per cent w/v)
0-20	63	37
20-25	63-20	37-80
25-35	20	80
35-36	20-63	80-37
36-50	63	37

Inject the test solution and the reference solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (0.3 per cent). Ignore any peaks with the area less than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Weigh accurately about 0.4 g, dissolve in 40 ml of *tetrahydrofuran*, add 10 ml of a 10 per cent w/v solution of *silver nitrate* and titrate with *0.1 M sodium hydroxide* using 2 ml of *bromocresol green solution* as indicator. Repeat the operation without the substance under examination. The difference between the titrations represents the amount of sodium hydroxide required.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.02984 g of $C_{20}H_{26}O_2$.

Storage. Store protected from light and moisture.

Norethisterone Tablets

Norethindrone Tablets

Norethisterone Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of norethisterone, $C_{20}H_{26}O_2$.

Usual strength. 5 mg.

Identification

Place a quantity of the powdered tablets containing 25 mg of Norethisterone on a small filter, wash with three quantities, each of 5 ml, of *light petroleum (60° to 80°)* and discard the washings. Extract the residue with 15 ml of *chloroform*, evaporate the extract to dryness and recrystallise from aqueous *methanol*. The residue complies with the following test.

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. A mixture of 90 volumes of *acetone* and 10 volumes of *1,2-propanediol*.

Mobile phase. A mixture of 40 volumes of *cyclohexane* and 10 volumes of *toluene*.

Test solution. Dissolve 25 mg of the substance under examination in 10 ml of the solvent mixture.

Reference solution (a). Dissolve 25 mg of *norethisterone RS* in 10 ml of the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

Tests

Uniformity of content. (*For tablets containing 10 mg or less*)– Comply with the test stated under Tablets.

Carry out the procedure described under Assay but using the following test solution.

Test solution. Powder one tablet and dissolve as completely as possible in 2 ml of *water* with the aid of ultrasound for 15 minutes and dilute to 5.0 ml with *methanol*. Centrifuge for 15 minutes and use the clear supernatant liquid.

Calculate the content of $C_{20}H_{26}O_2$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing about 5 mg of Norethisterone in 10 ml of *water*, sonicate for 15 minutes and dilute to 25.0 ml with *methanol*, filter.

Reference solution. A 0.02 per cent w/v solution of *norethisterone RS* in *methanol.*

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm) (Such as Spherisorb ODS 1),
- mobile phase: a mixture of 28 volumes of *water* and 72 volumes of *methanol*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

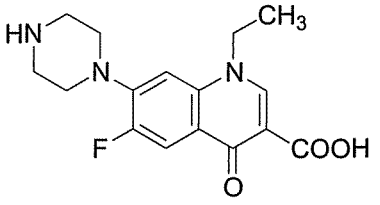
Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Calculate the content of $C_{20}H_{26}O_2$ in the tablets.

Storage. Store protected from light and moisture.

Norfloxacin



$C_{16}H_{18}FN_3O_3$ Mol. Wt. 319.3

Norfloxacin is 1-ethyl-6-fluoro-4-oxo-7-(piperazin-1-yl)-1,4-dihydroquinoline-3-carboxylic acid.

Norfloxacin contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{16}H_{18}FN_3O_3$, calculated on the dried basis.

Category. Antibacterial.

Dose. 400 mg to 800 g daily, in divided doses.

Description. A white to pale yellow, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *norfloxacin RS* or with the reference spectrum of norfloxacin.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.0005 per cent w/v solution in *0.1 M sodium hydroxide* shows an absorption maximum at about 273 nm.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*, previously washed with *methanol* and dried.

Mobile phase. A mixture of 40 volumes of *dichloromethane*, 40 volumes of *methanol*, 20 volumes of *toluene*, 14 volumes of *diethylamine* and 8 volumes of *water.*

Test solution. Dissolve 0.8 g of the substance under examination in 100 ml of a mixture of equal volumes of *methanol* and *dichloromethane.*

Reference solution. Dissolve 4.0 mg of *norfloxacin RS* in 1 ml of *glacial acetic acid*, add 4 ml of *methanol* and mix; dilute 1 ml of the solution with 9 ml of a mixture of equal volumes of *methanol* and *dichloromethane* (reference solution A). Dilute a portion of reference solution A with an equal volume of the *methanol-dichloromethane* mixture (reference solution B).

Apply separately to the plate spots of the three solutions in quantities indicated below. For spot 1 use 5 µl of the test

solution; for spots 2, 3 and 4 use 1 µl, 1.5 µl and 2 µl respectively of reference solution A; for spot 5 use 5 µl of reference solution B. Place the plate in a paper-lined chamber previously equilibrated with the mobile phase and allow the solvent front to move about nine-tenths of the length of the plate. After development, dry the plate in air and examine in ultraviolet light at 254 nm and 365 nm. Compare the intensities of any secondary spots in the chromatogram obtained with the test solution with those of the principal spots (2), (3), (4) and (5). The sum of the intensities of secondary spots obtained with the test solution is not more than 0.5 per cent of impurities. (The spots (2) (3) (4) and (5) represent 0.2 per cent, 0.3 per cent, 0.4 per cent and 0.5 per cent respectively of impurities).

Heavy metals (2.3.13). 1.33 g complies with the limit test for heavy metals, Method B (15 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent, determined on 1.0 g in a platinum crucible.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 0.5 g by drying in an oven at 100° at a pressure not exceeding 0.7 kPa.

Assay. Weigh accurately about 0.3 g and dissolve in 100 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25) and using a suitable anhydrous electrode system. (The electrode system may be rendered anhydrous by filling the electrode with *0.1 M lithium perchlorate* in *acetic anhydride* after removing any aqueous solution contained in it). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03193 g of $C_{16}H_{18}FN_3O_3$.

Storage. Store protected from light and moisture.

Norfloxacin Eye Drops

Norfloxacin Eye Drops are a sterile solution of Norfloxacin in Purified water.

Norfloxacin Eye Drops contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of norfloxacin, $C_{16}H_{18}FN_3O_3$.

Usual strength. 0.3 per cent w/v.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 4.6 to 5.5.

Other tests. Comply with the tests stated under Eye Drops.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a suitable volume of the eye drops with a 0.1 per cent v/v solution of *orthophosphoric acid* to produce a solution containing 0.005 per cent w/v of Norfloxacin.

Reference solution. A 0.005 per cent w/v solution of *norfloxacin RS* in 0.1 per cent v/v solution of *orthophosphoric acid*.

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (10 µm) (Such as Bondapack C18),
- column temerature. 50°,
- mobile phase: a mixture of 300 volumes of *methanol* and 700 volumes of 0.1 per cent v/v *orthophosphoric acid*,
- flow rate. 2 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume. 20 µl.

Precondition the column using *0.01 M anhydrous sodium dihydrogen orthophosphate*, adjusted to pH 4.0 with *orthophosphoric acid*, at a flow rate of 0.5 ml per minute for 8 hours. Equilibrate the column with the mobile phase for about 30 minutes before starting the chromatography.
Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0. The relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject alternately the test solution and the reference solution.

Calculate the content of $C_{16}H_{18}FN_3O_3$ in the eye drops.

Storage. Store protected from light.

Norfloxacin Tablets

Norfloxacin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of norfloxacin, $C_{16}H_{18}FN_3O_3$.

Usual strengths. 200 mg; 400 mg; 800 mg.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 40 volumes of *chloroform*, 40 volumes of *methanol*, 20 volumes of *toluene*, 14 volumes of *diethylamine* and 8 volumes of *water*.

Test solution. Shake a quantity of the finely powdered tablets containing 75 mg of Norfloxacin with 50 ml of a mixture of equal volumes of acidified *methanol* (containing 0.9 per cent

v/v of *hydrochloric acid*) and *dichloromethane*, centrifuge and use the clear supernatant solution.

Reference solution. A 0.15 per cent w/v solution of *norfloxacin RS* in the same solvent mixture.

Apply to the plate 50 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to norfloxacin in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1,
Medium. 750 ml of *acetate buffer pH 4.0*,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with *acetate buffer pH 4.0*, if necessary, at the maximum at about 278 nm (2.4.7). Concomitantly measure the absorbance of a solution of known concentration of *norfloxacin RS* in the same medium. Calculate the total content of $C_{16}H_{18}FN_3O_3$ in the medium.

D. Not less than 70 per cent of the stated amount of $C_{16}H_{18}FN_3O_3$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Add 80 ml of the mobile phase to an accurately weighed quantity of the powdered tablets containing about 100 mg of Norfloxacin, mix with the aid of ultrasound for 10 minutes, dilute with a 0.1 per cent v/v solution of *phosphoric acid* to 200.0 ml and mix. Dilute 10.0 ml of this solution to 25.0 ml with the mobile phase, mix and use the resulting solution after filtration through a filter with porosity of not more than 0.1 µm.

Reference solution. A 0.02 per cent w/v solution of *norfloxacin RS* in the mobile phase.

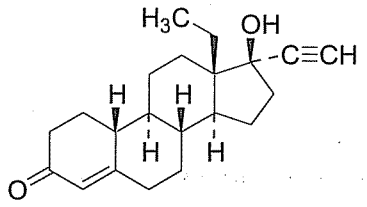
Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: 85 volumes of a 0.1 per cent v/v solution of *phosphoric acid* and 15 volumes of *acetonitrile*,
- temperature. column 40° ± 1°, after preconditioning with degassed *0.01 M sodium dihydrogen phosphate* adjusted to pH 4.0 with *phosphoric acid* flowing at a rate of 0.5 ml per minute for 8 hours,
- flow rate. 2 ml per minute,
- spectrophotometer set at 275 nm,
- injection volume. 20 µl.

Inject the test solution and the reference solution. The assay is not valid unless the capacity factor is not less than 2, the column efficiency is not less than 1500 theoretical plates, the tailing factor for the norfloxacin peak is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Calculate the content of $C_{16}H_{18}FN_3O_3$ in the tablets.

Storage. Store protected from light and moisture.

Norgestrel



$C_{21}H_{28}O_2$ Mol. Wt. 312.5

Norgestrel is *rac*-13-ethyl-17-hydroxy-18,19-dinor-17α-pregn-4-en-20-yn-3-one.

Category. Progestogen.

Dose. As a contraceptive, 150 to 300 µg in combination with 20 to 50 µg of ethinyloestradiol daily.

Description. A white or almost white, crystalline powder; practically odourless.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *norgestrel RS*.

B. When examined in the range 220 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* shows an absorption maximum only at about 240 nm.

C. Melting range (2.4.21). 205° to 212°, but the range between beginning and end of melting does not exceed 4°.

Tests

Specific optical rotation (2.4.22). –0.1° to +0.1°, determined in a 5.0 per cent w/v solution in *chloroform*.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 80 volumes of *dichloromethane* and 20 volumes of *ethyl acetate*.

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of *chloroform.*

Reference solution (a). A 0.01 per cent w/v solution of the substance under examination in *chloroform.*

Reference solution (b). A 0.004 per cent w/v solution of the substance under examination in *chloroform.*

Apply to the plate 10 µl of each solution. After development, dry the plate in air and spray with *phosphomolybdic acid solution.* Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than two such spots are more intense than the spot in the chromatogram obtained with reference solution (b).

Sulphated ash. (2.3.18) Not more than 0.3 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 5 hours.

Assay. Weigh accurately about 0.1 g, dissolve in sufficient *ethanol (95 per cent)* to produce 100.0 ml, dilute stepwise with *ethanol (95 per cent)* to obtain a solution containing 0.001 per cent w/v of levonorgestrel and measure the absorbance of the resulting solution at the maximum at about 241 nm, (2.4.7). Calculate the content of $C_{21}H_{28}O_2$ from the absorbance obtained with a 0.001 per cent w/v solution of *norgestrel RS* in *ethanol (95 per cent).*

Storage. Store protected from moisture.

Norgestrel and Ethinyloestradiol Tablets

Norgestrel and Ethinyloestradiol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of norgestrel, $C_{21}H_{28}O_2$ and ethinyloestradiol, $C_{20}H_{24}O_2$.

Category. Oral contraceptive.

Dose. One tablet daily for 21 days starting from the fifth day of menstrual cycle.

Usual strength. Norgestrel, 300 µg and Ethinyloestradiol, 30 µg.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G.*

Mobile phase. A mixture of 96 volumes of *dichloromethane* and 4 volumes of *ethanol (95 per cent).*

Test solution. Powder 20 tablets finely, triturate with 20 ml of *dichloromethane,* allow the solids to sediment and use the clear supernatant liquid.

Reference solution. A solution containing 0.06 per cent w/v solution of *norgestrel RS* and 0.006 per cent w/v solution of *ethinyloestradiol RS.*

Apply to the plate 40 µl of each solution. After development, dry the plate in air, spray with *ethanolic sulphuric acid (80 per cent v/v),* heat at 110° for 10 minutes and examine in ultraviolet light at 365 nm. The principal spots in the chromatogram obtained with the test solution correspond to the spots for norgestrel (red fluorescence) and ethinyloestradiol (orange-yellow fluorescence) in the chromatogram obtained with the reference solution.

Tests

Uniformity of content. Comply with the test stated under Tablets.

Carry out the procedure described under Assay but using the following test solution.

Test solution. Add 2.0 ml of *methanol (70 per cent)* and 2.0 ml of a 0.00002 per cent w/v solution of *diphenyl* in *methanol (70 per cent)* (internal standard solution) to one tablet, shake for 20 minutes, centrifuge, filter the supernatant liquid through a membrane filter with a pore size of not more than 0.2 mm and use the filtrate.

Calculate the contents of norgestrel $C_{21}H_{28}O_2$, and ethinyloestradiol, $C_{20}H_{24}O_2$, in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14) using the chromatographic system described under Uniformity of content.

Test solution. Weigh and powder 20 tablets. To a quantity of the powder equivalent to one tablet add 2.0 ml of *methanol (70 per cent)* and 2.0 ml of a 0.00002 per cent w/v solution of *diphenyl* in *methanol (70 per cent)* (internal standard solution), shake for 20 minutes, centrifuge, filter the supernatant liquid through a membrane filter with a pore size of not more than 0.2 mm and use the filtrate.

Reference solution. A solution in *methanol (70 per cent)* containing 0.15 mg per ml of *norgestrel RS* and 0.015 mg per ml of *ethinyloestradiol RS.* Take 2.0 ml of this solution and add 2.0 ml of a 0.00002 per cent w/v solution of *diphenyl* in *methanol (70 per cent)* and use the resulting solution.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 to 7 µm),
- mobile phase: a mixture of 35 volumes of *acetonitrile,* 15 volumes of *methanol* and 45 volumes of *water,*
- flow rate. 1 to1.5 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume. 20 µl.

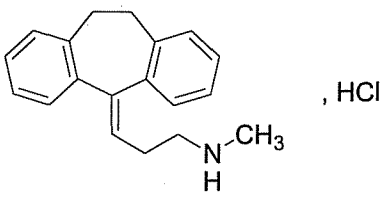
Inject the reference solution. The resolution between the two major peaks is not less 2.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution. The relative retention times are about 0.7 for ethinyloestradiol and about 1.0 for norgestrel.

Calculate the contents of norgestrel, $C_{21}H_{28}O_2$, and ethinyloestradiol, $C_{20}H_{24}O_2$ in the tablets.

Storage. Store protected from light.

Nortriptyline Hydrochloride



, HCl

$C_{19}H_{21}N,HCl$ Mol. Wt. 299.8

Nortriptyline Hydrochloride is 3-(10,11-dihydro-5*H*-dibenzo [*a*,*d*]cyclohept-5-ylidene)propyl(methyl)amine hydrochloride.

Nortriptyline Hydrochloride contains not less than 98.0 per cent and not more than 101.5 per cent of $C_{19}H_{21}N,HCl$, calculated on the dried basis.

Category. Antidepressant.

Dose. Initially, 50 to 150 mg daily; maintenance dose, 30 to 75 mg daily.

Description. A white to off-white powder; odour slight and characteristic.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and, D are carried out.

A. Dissolve 0.1 g in 10 ml of *water*, make alkaline with *1 M sodium hydroxide*, extract with 5 ml of *chloroform* and evaporate to dryness using a current of nitrogen.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *nortriptyline hyrdochloride RS* treated in the same manner or with the reference spectrum of nortriptyline.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* shows an absorption maximum only at about 239 nm; absorbance at about 239 nm, about 0.48.

C. To about 50 mg dissolved in 3 ml of warm *water*, add 1 drop of a 2.5 per cent w/v solution of *quinhydrone* in *methanol*; a red colour is produced after a few minutes (distinction from amitriptyline).

D. Gives the reactions of chlorides (2.3.1).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 85 volumes of *cyclohexane*, 15 volumes of *ethyl acetate* and 3 volumes of *diethylamine*.

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of *ethanol (95 per cent)* prepared in subdued light.

Reference solution. A 0.001 per cent w/v solution of *dibenzosuberone RS* in *ethanol (95 per cent)* prepared in subdued light.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 14 cm in an unsaturated tank protected from light. Dry the plate in air, spray with a freshly prepared solution of *sulphuric acid* containing 4 per cent v/v of *formaldehyde solution* and examine immediately in ultraviolet light at 365 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Weigh accurately about 0.25 g and dissolve in 25 ml of *anhydrous glacial acetic acid*, warm slightly, if necessary, to effect solution. Cool, add 5 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02998 g of $C_{19}H_{21}N,HCl$.

Storage. Store protected from light and moisture.

Nortriptyline Tablets

Nortriptyline Hydrochloride Tablets

Nortriptyline Tablets contain less than 90.0 per cent and not more than 110.0 per cent of the stated amount of nortriptyline, $C_{19}H_{21}N$. The tablets are coated.

Usual strengths. The equivalent of 10 mg and 25 mg of nortriptyline.

Identification

A. Shake a quantity of the powdered tablets containing about 5 mg of nortriptyline with 20 ml of *methanol* and filter. To 1 ml of the filtrate add 1 ml of a 2.5 per cent w/v solution of *sodium bicarbonate*, 1 ml of a 2 per cent w/v solution of *sodium periodate* and 1 ml of a 0.3 per cent w/v solution of *potassium permanganate*. Allow to stand for 15 minutes, acidify with *1 M sulphuric acid* and extract with 10 ml of *2,2,4-trimethylpentane*.

When examined in the range 230 nm to 360 nm (2.4.7), the resulting trimethylpentane solution shows an absorption maximum only at about 265 nm.

B. Triturate a quantity of the powdered tablets containing 0.1 g of nortriptyline with 10 ml of *chloroform*, filter and evaporate the filtrate to a low volume. Add *ether* until a turbidity is produced and allow to stand. Dissolve 50 mg of the precipitate in 3 ml of warm *water*, cool and add 1 drop of a 2.5 per cent w/v solution of *quinhydrone* in *methanol*; a red colour is produced after a few minutes (distinction from amitriptyline).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 85 volumes of *cyclohexane*, 15 volumes of *ethyl acetate* and 3 volumes of *diethylamine*.

Test solution. Extract a quantity of the powdered tablets containing 20 mg of nortriptyline with 5 ml of a mixture of 9 volumes of *ethanol (95 per cent)* and 1 volume of *2 M hydrochloric acid*, centrifuge and use the supernatant liquid.

Reference solution. A 0.001 per cent w/v solution of *dibenzosuberone RS* in *ethanol (95 per cent)* prepared in subdued light.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 14 cm in an unsaturated tank protected from light. Dry the plate in air, spray with a freshly prepared solution of *sulphuric acid* containing 4 per cent v/v of *formaldehyde solution* and examine immediately in ultraviolet light at 365 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Uniformity of content *(For tablets containing 10 mg or less)*. Comply with the test stated under Tablets.

Determine by liquid chromatography (2.4.14).

Test solution. Powder one tablet, add 2.5 ml of *water*, shake vigorously to completely disperse the tablet, add 5 ml of *methanol* and shake for 30 minutes. Add sufficient *water* to produce 10 ml, centrifuge and use the clear supernatant liquid.

Reference solution. A 0.01 per cent w/v solution of *nortriptyline hydrochloride RS* in *methanol (50 per cent)*.

Follow the procedure given in the Assay. Calculate the content of $C_{20}H_{23}N$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Shake vigorously 20 tablets with 50 ml of *water* until the tablets disintegrate completely, add 100.0 ml of *methanol* and shake for 30 minutes. Add sufficient *water* to produce 200.0 ml, filter and dilute a volume of the filtrate containing about 25 mg of nortriptyline to 100.0 ml with *methanol (50 per cent)*.

Reference solution. A 0.025 per cent w/v solution of *nortriptyline hydrochloride RS* in *methanol (50 per cent)*.

Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a 0.56 per cent w/v solution of *sodium hexanesulphonate* in a mixture of equal volumes of *water* and *acetonitrile* adjusted to pH 4.5 with *glacial acetic acid*,
- flow rate. 2 ml per minute,
- spectrophotometer set at 239 nm,
- injection volume. 20 µl.

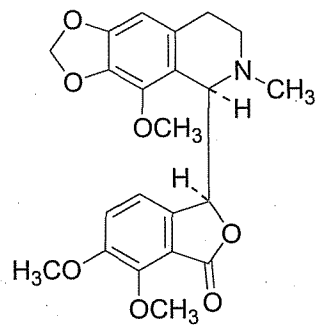
Inject the test solution and the reference solution.

Calculate the content of $C_{19}H_{21}N$ in the tablets.

Storage. Store protected from light and moisture.

Noscapine

Narcotine



$C_{22}H_{23}NO_7$ Mol. Wt. 413.4

Noscapine is (3*S*)-6,7-dimethoxy-3-[(5*R*)-5,6,7,8-tetrahydro-4-methoxy-6-methyl-1,3-dioxolo[4,5-*g*]isoquinolin-5-yl]phthalide, an alkaloid obtained from opium.

Noscapine contains not less than 98.5 per cent and not more than 100.5 per cent of $C_{22}H_{23}NO_7$, calculated on the dried basis.

Category. Cough suppressant.

Dose. 15 to 30 mg three to four times daily.

Description. Colourless crystals or a white crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *noscapine RS* or with the reference spectrum of noscapine.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.005 per cent w/v solution in *methanol* shows absorption maxima at about 291 nm and 310 nm; ratio of absorbance at the maximum at about 310 nm to that at the maximum at about 291 nm, 1.2 to 1.3.

C. To 0.1 g in a porcelain dish add a few drops of *sulphuric acid* and stir; a greenish-yellow solution is formed which on warming becomes red and finally violet.

D. Dissolve 50 mg in 5 ml of *5 M hydrochloric acid*, add 10 ml of a mixture of equal volumes of *ethanol (95 per cent)* and a saturated solution of *sodium acetate*, mix and allow to stand for about 3 minutes; shining crystals separate.

Tests

Appearance of solution. A 2.0 per cent w/v solution in *acetone* examined immediately after preparation is clear (2.4.1), and not more intensely coloured than reference solution YS6 (2.4.1).

Specific optical rotation (2.4.22). +42.0° to +48.0°, determined at 20° in a solution prepared by dissolving 0.5 g in sufficient *0.1 M hydrochloric acid* to produce 25.0 ml.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination with gentle heating in 14 ml of *methanol*, cool, and dilute to 20 ml with *phosphate buffer solution pH 6.0*.

Reference solution (a). Dilute 1.0 ml of the test solution to 20.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *papaverine hydrochloride* in 50 ml of the test solution. Dilute 1.0 ml of this solution to 20 ml with the mobile phase.

Reference solution (c). Dissolve 1.5 mg of *papaverine hydrochloride* in 10 ml of the test solution and dilute to 50 ml with the mobile phase.

Chromatographic system
- a stainless steel column 12.5 cm x 4.6 mm, packed with nitrile groups chemically bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of *methanol* and 65 volumes of *phosphate buffer pH 6.0*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume. 20 µl.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to noscapine and papaverine (noscapine impurity A) is not less than 2.0. The relative retention time with reference to noscapine for noscapine impurity A is about 1.3.

Inject the test solution, reference solution (a) and (b). Run the chromatogram 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of the peak due to noscapine impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of the any other secondary peak is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), and the sum of the areas of secondary peaks other than noscapine impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Morphine. Dissolve 0.1 g in 10 ml of *0.1 M hydrochloric acid*. To 1 ml of the resulting solution add a mixture of 1 ml of *potassium ferricyanide solution*, 0.05 ml of *ferric chloride test solution* and 4 ml of *water*; no blue or dark green colour develops within 1 minute.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.35 g, dissolve in 40 ml of *anhydrous glacial acetic acid*, warming gently. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04134 g of $C_{22}H_{23}NO_7$.

Storage. Store protected from light and moisture.

Noscapine Linctus

Narcotine Linctus

Noscapine Linctus is a solution of Noscapine in a suitable flavoured vehicle. It may contain up to 1 per cent w/v solution of Citric Acid.

Noscapine Linctus contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of noscapine, $C_{22}H_{23}NO_7$.

Usual strength. 7 mg per 5 ml.

Identification

To a quantity containing 60 mg of Noscapine add 20 ml of *water*, 2 g of *sodium chloride* and 2 ml of *5 M sodium hydroxide*. Extract with successive quantities of 50, 50, 25 and 25 ml of *ether*. Combine the extracts, wash with three quantities, each of 5 ml, of *water* and evaporate to dryness. Dissolve the residue in 20 ml of *chloroform*. Wash with three quantities, each of 20 ml, of *water*, dry the chloroform layer with *anhydrous sodium sulphate*, filter and evaporate the solvent. If necessary, induce crystallisation by scratching with a glass rod. The crystals comply with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *noscapine RS* or with the reference spectrum of noscapine.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.005 per cent w/v solution in *methanol* shows absorption maxima at about 291 nm and 310 nm; ratio of absorbance at the maximum at about 310 nm to that at the maximum at about 291 nm, 1.2 to 1.3.

Tests

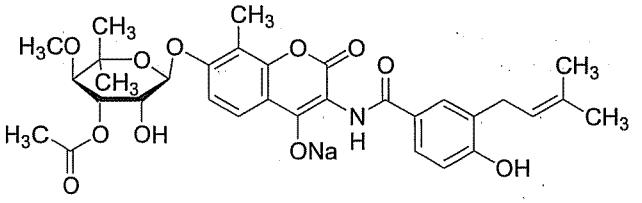
Other tests. Complies with the tests stated under Oral Liquids.

Assay. Weigh accurately a quantity containing 60 mg of Noscapine, add 20 ml of *water*, 2 g of *sodium chloride* and 2 ml of *5 M sodium hydroxide* and extract with successive quantities of 50, 50, 25 and 25 ml of *ether*. Combine the extracts, wash with three quantities, each of 5 ml, of *water* and evaporate to dryness. To the residue add 50.0 ml of *0.1 M hydrochloric acid*, warm on a water-bath to dissolve and to remove any traces of ether and dilute to 100.0 ml with *water*. Dilute 3.0 ml to 50.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 310 nm (2.4.7). Calculate the content of $C_{22}H_{23}NO_7$ taking 90.7 as the specific absorbance at 310 nm.

Determine the weight per ml of the linctus (2.4.29), and calculate the content of $C_{22}H_{23}NO_7$, weight in volume.

Storage. Store protected from light and moisture.

Novobiocin Sodium



$C_{31}H_{35}N_2NaO_{11}$ Mol. Wt. 634.6

Novobiocin Sodium is the monosodium salt of novobiocin, *N*-[7-{3-*O*-(aminocarbonyl)-6-deoxy-5-*C*-methyl-4-*O*-methyl-β-L-*lyxo*-hexopyranosyl}-oxy-4-hydroxy-8-methyl-2-oxo-2*H*-1-benzopyran-3-yl]-4-hydroxy-3-(3-methyl-2-butenyl)benzamide, an antimicrobial substance produced by the growth of certain strains of *Streptomyces niveus* or related organisms or by other means.

Novobiocin Sodium contains the equivalent of not less than 850 µg of novobiocin per mg, calculated on the dried basis.

Category. Antibacterial.

Dose. The equivalent of 1 to 2 g of novobiocin daily, in divided doses.

Description. A white or yellowish white, crystalline powder.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 75 volumes of *chloroform*, 25 volumes of *methanol* and 1 volume of *strong ammonia solution*.

Test solution. Dissolve a quantity of the substance under examination in *methanol* so as to obtain a solution containing 0.1 per cent w/v solution of novobiocin.

Reference solution. A 0.1 per cent w/v solution of *novobiocin RS* in *methanol*.

Apply to the plate 1 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in a 0.4 per cent w/v solution of *potassium hydroxide* shows an absorption maximum only at about 307 nm.

C. The residue obtained by igniting it gives the tests for sodium salts (2.3.1).

Tests

pH (2.4.24). 6.6 to 8.5, determined in a 2.5 per cent w/v solution.

Specific optical rotation (2.4.22). –50.0° to –58.0°, determined in a 5.0 per cent w/v solution in *methanol* containing 1 per cent v/v of *hydrochloric acid.*

Loss on drying (2.4.19). Not more than 6 per cent, determined on 0.2 g by drying in an oven at 60° over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa for 3 hours.

Assay. Determine by the microbiological assay of antibiotics, Method A (2.2.10), and express the results in µg of novobiocin per mg.

Novobiocin Sodium intended for use in the manufacture of Parenteral Preparations complies with the following additional requirements.

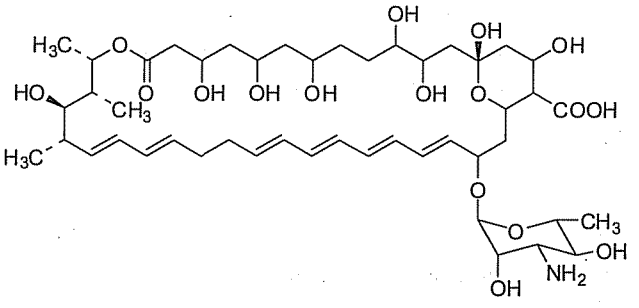
Bacterial endotoxins (2.2.3). Not more than 0.7 Endotoxin units per mg.

Sterility. Complies with the test for sterility (2.2.11).

Storage. Store protected from light and moisture at a temperature not exceeding 30°. If it is intended for use in the manufacture of parenteral preparations, the container should be sterile and sealed so as to exclude micro-organisms.

Labelling. The label states whether or not the contents are intended for use in the manufacture of parenteral preparations.

Nystatin



$C_{47}H_{75}NO_{17}$ Mol. Wt. 926.1

Nystatin is an antifungal substance produced by the growth of certain strains of *Streptomyces noursei* or by any other means. It consists mainly of polyenes, the principal component being nystatin A_1.

Nystatin has a potency of not less than 4400 Units per mg, calculated on the dried basis.

Category. Antifungal.

Dose. In the treatment of alimentary candidiasis, 500,000 to 1,000,000 Units daily, in divided doses.

Description. A yellow to slightly brown powder; odour, characteristic; hygroscopic.

Identification

A. When examined in the range 220 nm to 360 nm (2.4.7), the final solution obtained in the test for Light absorption shows absorption maxima at about 230 nm, 291 nm, 305 nm and 319 nm. The ratios of the absorbances at the maxima at about 291 nm and about 319 nm to the absorbance at the maximum at about 305 nm are 0.61 to 0.73 and 0.83 to 0.96, respectively. Use as the blank a solution prepared in the same manner without the substance under examination.

B. Shake 30 mg with 5 ml of *water* for 2 minutes, add 2 ml of *sodium molybdotungstophosphate solution*, and allow to stand for 1 hour; the green colour produced is darker than that produced by repeating the test without the substance under examination.

C. Shake 30 mg with 5 ml of *water* for 2 minutes, add 2 ml of a solution prepared by dissolving 0.1 g of *pyrogallol* in 100 ml of *decolorised magenta solution*, heat on a water-bath until a dark pink colour is produced, cool and allow to stand for 1 hour; the pink colour is retained.

D. To 2 mg add 0.1 ml of *hydrochloric acid*; a brown colour is produced.

E. To 2 mg add 0.1 ml of *sulphuric acid*; a brown colour is produced which becomes violet on standing.

Tests

pH (2.4.24). 6.5 to 8.0, determined in a 3.0 per cent w/v suspension in *water*.

Light absorption (2.4.7). Dissolve 0.1 g in a mixture of 5.0 ml of *glacial acetic acid* and 50 ml of *methanol*, add sufficient *methanol* to produce 100.0 ml and dilute 1.0 ml of the resulting solution to 100.0 ml with *methanol*. Absorbance of the resulting solution, measured within 30 minutes of preparation, at the maximum at about 305 nm, not less than 0.60. Use as the blank a solution prepared in the same manner without the substance under examination.

Composition. Determine by liquid chromatography (2.4.14).

Note—Carry out the test protected from light.

Test solution. Dissolve 20 mg of the substance under examination in 50 ml of *dimethyl sulphoxide.*

Reference solution (a). A 0.04 per cent w/v solution of *nystatin RS* in *dimethyl sulphoxide.*

Reference solution (b). Dissolve 20 mg of the substance under examination in 25 ml of the *methanol* and dilute to 50 ml with

water. To 10.0 ml of this solution add 2.0 ml of *dilute hydrochloric acid*. Allow to stand at room temperature for 1 hour.

Reference solution (c). Dilute 1.0 ml of reference solution (a) in 100.0 ml of *dimethyl sulphoxide*. Dilute 1.0 ml of this solution to 10.0 ml with *dimethyl sulphoxide*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with base-deactivated end-capped octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a mixture of 29 volumes of *acetonitrile* and 71 volumes of 0.385 per cent w/v solution of *ammonium acetate*,
  B. a mixture of 40 volumes of 0.385 per cent w/v solution of *ammonium acetate* and 60 volumes of *acetonitrile*.
- a linear gradient programme using the conditions given below,
- flow rate. 1 ml per minute,
- spectrophotometer set at 305 nm,
- injection volume. 20 µl.

Time (in min.)	Mobile phase A (per cent w/v)	Mobile phase B (per cent w/v)
0-25	100	0
25-35	100-0	0-100
35-45	0	100
45-50	0-100	100-0
50-55	100	0

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 3.5.

Inject the test solution, reference solution (a) and (c). In the chromatogram obtained with the test solution the area of the peak due to nystatin A1 is not less than 85 per cent the area of the principal peak in the chromatogram obtained with reference solution (a), the area of the any other compound is not more than 4.0 per cent the area of the principal peak in the chromatogram obtained with reference solution (a). Ignore any peak with a retention time of less than 2 minutes.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 3.5 per cent.

Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 1.0 g by drying in an oven at 60° at a pressure not exceeding 0.1 kPa for 3 hours.

Assay. *Protect the solution from light throughout the assay.*

Weigh accurately about 75 mg and dissolve in sufficient *dimethylformamide* to produce 50.0 ml; dilute 10.0 ml of the resulting solution to 200.0 ml with *buffer solution No 4* (2.2.10). Determine by the microbiological assay of antibiotics (2.2.10).

Nystatin intended for oral administration complies with the following additional requirement.

Abnormal toxicity (2.2.1). Complies with the test for abnormal toxicity, using a quantity containing not less than 600 Units suspended in not more than 0.5 ml of a 0.5 per cent w/v solution of *acacia* and injecting the suspension intraperitoneally.

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of the number of Units of Nystatin per mg.

Nystatin Ointment

Nystatin Ointment is a dispersion of Nystatin in microfine powder in a suitable ointment basis.

Nystatin Ointment contains not less than 90.0 per cent and not more than 130.0 per cent of the stated number of Units of nystatin.

Usual strength. 100,000 Units per g.

Identification

Disperse a quantity containing 25,000 Units in 10 ml of *chloroform*, add 40 ml of *methanol* and shake. Filter and dilute 1 ml of the filtrate to 25 ml with *methanol*.

When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows absorption maxima at about 291 nm, 305 nm and 319 nm. The ratios of the absorbances at the maxima at about 291 nm and about 319 nm to the absorbance at the maximum at about 305 nm are 0.61 to 0.73 and 0.83 to 0.96, respectively. Use as the blank a solution prepared exactly in the same manner without the substance under examination.

Tests

Other tests. Complies with the tests stated under Ointments.

Assay. *Protect the solution from light throughout the assay.*

Weigh accurately a quantity containing 400,000 Units, disperse in 20 ml of *ether* in a stoppered flask, add 70 ml of *dimethylformamide*, shake for a few minutes, add 10 ml of *water*, shake vigorously for a few minutes and add sufficient *dimethylformamide* to produce 100.0 ml. Mix well, filter and dilute 10.0 ml of the filtrate to 100.0 ml with *buffer solution No 4* (2.2.10).

Determine by the microbiological assay of antibiotics (2.2.10).

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the number of Units of Nystatin per g.

Nystatin Pessaries

Nystatin Vaginal Tablets

Nystatin Pessaries contain not less than 90.0 per cent and not more than 130.0 per cent of the stated number of Units of nystatin.

Usual strength. 100,000 Units.

Identification

Extract a quantity of the powdered pessaries containing 300,000 Units with a mixture of 50 ml of *methanol* and 5 ml of *glacial acetic acid*, add sufficient *methanol* to produce 100 ml and filter. Dilute 1 ml of the filtrate to 100 ml with *methanol*. The resulting solution complies with the follwing test.

Disperse a quantity containing 25,000 Units in 10 ml of *chloroform*, add 40 ml of *methanol* and shake. Filter and dilute 1 ml of the filtrate to 25 ml with *methanol*.

When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows absorption maxima at about 291 nm, 305 nm and 319 nm. The ratios of the absorbances at the maxima at about 291 nm and about 319 nm to the absorbance at the maximum at about 305 nm are 0.61 to 0.73 and 0.83 to 0.96, respectively. Use as the blank a solution prepared exactly in the same manner without the substance under examination.

Tests

Other tests. Comply with the tests stated under Pessaries.

Loss on drying (2.4.19). Not more than 5 per cent, determined on 1.0 g of the powdered pessaries by drying in an oven at 60° at a pressure not exceeding 0.7 kPa for 3 hours.

Assay. *Protect the solution from light throughout the assay.*

Weigh and powder 20 pessaries. Weigh accurately a quantity of the powder containing 200,000 Units and shake with 50.0 ml of *dimethylformamide* for 1 hour. Centrifuge, dilute 10.0 ml of the clear, supernatant liquid to 200.0 ml with *buffer solution No 4* (2.2.10).

Determine by the microbiological assay of antibiotics (2.2.10).

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of the number of Units of Nystatin.

Nystatin Tablets

Nystatin Tablets contain not less than 90.0 per cent and not more than 130.0 per cent of the stated number of Units of nystatin. The tablets are coated.

Usual strength. 500,000 Units.

Identification

Extract a quantity of the powdered tablets containing 300,000 Units with a mixture of 50 ml of *methanol* and 5 ml of *glacial acetic acid*, add sufficient *methanol* to produce 100 ml and filter. Dilute 1 ml of the filtrate to 100 ml with *methanol*. The resulting solution complies with the follwing test.

When examined in the range 230 nm to 360 nm (2.4.7), the solution shows absorption maxima at about 291 nm, 305 nm and 319 nm. The ratios of the absorbances at the maxima at about 291 nm and about 319 nm to the absorbance at the maximum at about 305 nm are 0.61 to 0.73 and 0.83 to 0.96, respectively. Use as the blank a solution prepared exactly in the same manner without the substance under examination.

Tests

Disintegration (2.5.1). 30 minutes, but using a 0.6 per cent v/v solution of *hydrochloric acid* in place of *water*. If the tablets fail to disintegrate, wash them rapidly by immersion in *water* and continue the test using *phosphate buffer pH 6.8*; the tablets then disintegrate within a further 30 minutes.

Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 1.0 g of the powdered tablets by drying in an oven at 60° at a pressure not exceeding 0.7 kPa for 3 hours.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing 200,000 Units and shake with 50.0 ml of *dimethylformamide* for 1 hour. Centrifuge, dilute 10.0 ml of the clear, supernatant liquid to 200.0 ml with *buffer solution No 4* (2.2.10).

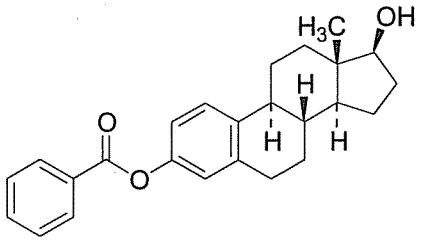
Determine by the microbiological assay of antibiotics (2.2.10).

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the number of Units of Nystatin.

O

Oestradiol Benzoate



$C_{25}H_{28}O_3$ Mol. Wt. 376.5

Oestradiol Benzoate is 17β-hydroxyestra-1,3,5(10)-trien-3-yl benzoate.

Oestradiol Benzoate contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{25}H_{28}O_3$, calculated on the dried basis.

Category. Oestrogen.

Dose. By intramuscular injection, 1 to 2 mg daily.

Description. Colourless crystals or a white, crystalline powder; odourless.

Identification

Test A may be omitted if tests B and C are carried out. Test C may be omitted if tests A and B are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *oestradiol benzoate RS* or with the reference spectrum of oestradiol benzoate.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (b) when examined in daylight and in ultraviolet light at 365 nm.

C. To about 1 mg add 0.5 ml of a 5 per cent w/v solution of *ammonium molybdate* in *sulphuric acid*; a yellowish green colour develops which exhibits an intense green fluorescence when examined in ultraviolet light at 365 nm. Add 1 ml of *sulphuric acid* and 9 ml of *water*; the solution becomes pink with a yellowish fluorescence.

Tests

Specific optical rotation (2.4.22). +57.0° to +63.0°, determined in a 1.0 per cent w/v solution in *dioxan*.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 90 volumes of *toluene* and 10 volumes of *ethanol (95 per cent)*.

Test solution (a). Dissolve 0.2 g of the substance under examination in 10 ml of a mixture of 90 volumes of *chloroform* and 10 volumes of *methanol*.

Test solution (b). Dissolve 0.1 g of the substance under examination in 100 ml of the same solvent mixture.

Reference solution (a). A 0.02 per cent w/v solution of the substance under examination in the same solvent mixture.

Reference solution (b). A 0.1 per cent w/v solution of *oestradiol benzoate RS* in the same solvent mixture.

Apply to the plate 5 µl of each solution. After development, dry the plate in air until odour of the solvent is no longer detectable, heat at 110° for 10 minutes, spray the plate while hot with *ethanolic sulphuric acid (20 per cent)*, heat again at 110° for 10 minutes and examine in ultraviolet light at 365 nm. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a).

Sulphated ash (2.3.18). Not more than 0.2 per cent, determined on 0.5 g.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 0.5 g by drying in an oven at 105° for 3 hours.

Assay. Weigh accurately about 25 mg, dissolve in sufficient *ethanol (95 per cent)* to produce 250.0 ml. Dilute 10.0 ml to 100.0 ml with *ethanol (95 per cent)* and measure the absorbance of the resulting solution at the maximum at about 231 nm (2.4.7). Calculate the content of $C_{25}H_{28}O_3$ taking 500 as the specific absorbance at 231 nm.

Storage. Store protected from light and moisture.

Oestradiol Injection

Oestradiol Benzoate Injection

Oestradiol Injection is a sterile solution of Oestradiol Benzoate in Ethyl Oleate or other suitable ester, in a suitable fixed oil or in any mixture of these. It may contain suitable alcohols.

Oestradiol Benzoate Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of oestradiol benzoate, $C_{25}H_{28}O_3$.

Usual strength. 1 mg per ml.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 80 volumes of *toluene* and 20 volumes of *ethyl acetate*.

Test solution. Add 10 ml of *2,2,4-trimethylpentane* to a volume of the injection containing 2 mg of Oestradiol Benzoate and extract with three quantities, each of 10 ml, of *ethanol (70 per cent)*. Wash the combined extracts with 15 ml of *2,2,4-trimethylpentane*, evaporate the ethanolic extract to dryness using a rotary evaporator and dissolve the residue in 2 ml of *chloroform*.

Reference solution. A 0.1 per cent w/v solution of *oestradiol benzoate RS* in *chloroform*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air, spray with *ethanolic sulphuric acid (20 per cent)*, heat at 105° for 10 minutes and examine in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution (a). Dilute an accurately measured quantity of the injection containing about 1 mg of Oestradiol Benzoate to 10.0 ml with a mixture of 90 volumes of *cyclohexane* and 10 volumes of *dioxan*.

Test solution (b). Add 1 ml of a solution prepared by dissolving 15 mg of *4-hydroxybenzaldehyde* (internal standard) in 10.0 ml of *dioxan*, adding sufficient *cyclohexane* to produce 100.0 ml (solution A), to an accurately measured quantity of the injection containing about 1 mg of Oestradiol Benzoate and dilute to 10.0 ml with sufficient of a mixture of 90 volumes of *cyclohexane* and 10 volumes of *dioxan*.

Reference solution. Add 10 ml of solution A to 10 mg of *oestradiol benzoate RS*, accurately weighed, and dilute to 100.0 ml with the same solvent mixture.

Chromatographic system
- a stainless steel column 30 cm x 4 mm, packed with porous silica particles (10 µm),
- mobile phase: 90 volumes of *cyclohexane* and 10 volumes of *dioxan*,
- flow rate. 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

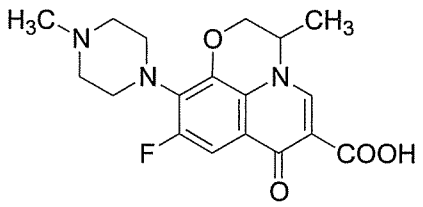
Inject test solutions (a), (b) and the reference solution. The assay is not valid unless the resolution between the peaks due to benzyl alcohol (if present) and oestradiol benzoate and between the peaks due to oestradiol benzoate and the internal standard is more than 1.5.

Calculate the content of $C_{25}H_{28}O_3$ in the injection.

Storage. Store protected from light.

Labelling. The label states (1) the nature and composition of the solvent; (2) that it is meant for intramuscular injection only; (3) that any solid matter that may have separated on standing should be redissolved by warming before use.

Ofloxacin



$C_{18}H_{20}FN_3O_4$ Mol. Wt. 361.4

Ofloxacin is (*RS*)-9-fluoro-3-methyl-10-(4-methylpiperazin-1-yl)-7-oxo-2,3-dihydro-7*H*-pyrido[1,2,3,-*de*]-1,4-benzoxazine-6-carboxylic acid

Ofloxacin contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{18}H_{20}FN_3O_4$, calculated on the dried basis.

Category. Antibacterial.

Dose. 200 to 400 mg daily.

Description. A pale yellow or bright yellow, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ofloxacin RS* or the spectrum obtained with the reference solution.

Tests

Light absorption. Absorbance at 440 nm (2.4.7), of 0.5 per cent w/v solution in *0.1 M hydrochloric acid* is not more than 0.25.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of the substance under examination in 10 ml of *methanol*.

Reference solution (a). A 0.1 per cent w/v solution of *ofloxacin RS* in *methanol*.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with *methanol*.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 10 volumes of *acetonitrile* and 90 volumes of *phosphate buffer pH 2.4* prepared by dissolving 27.2 g of *monobasic potassium phosphate* in 1000 ml of *water*, adjust the pH to 2.4 with

orthophosphoric acid,
- flow rate. 2 ml per minute,
- spectrophotometer set at 294 nm,
- injection volume. 10 µl.

Inject reference solution (b). The test is not valid unless the column efficiency in not less than 1400 theoretical plates.

Inject the test solution and reference solution (b). Run the chromatogram three times of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than the area of the peak in the chromatogram obtained with the reference solution (b) (1.0 per cent).

Heavy Metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.2 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

Assay. Weigh accurately about 0.3 g, dissolve in 100 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03614 g of $C_{18}H_{20}FN_3O_4$.

Storage. Store protected from light and moisture.

Ofloxacin Infusion

Ofloxacin Infusion is a sterile solution of Ofloxacin in 5 per cent Dextrose Injection or in Sodium Chloride Injection.

Ofloxacin Infusion contain not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of ofloxacin, $C_{18}H_{20}FN_3O_4$.

Usual strengths. 25 mg; 50 mg; 100 mg; 200 mg; 400 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 3.8 to 7.5.

Other tests. Complies with the tests stated under Parenteral Preparation (Infusions).

Assay. Determine by liquid chromatography (2.4.14).

NOTE —Protect the solutions from the light.

Test solution. Measure accurately a volume containing 50 mg of Ofloxacin in 100.0 ml with mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with mobile phase.

Reference solution. A 0.005 per cent w/v solution of *ofloxacin RS* in mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 80 volumes of buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* and 0.47 g *sodium 1-hexane sulphonate* in 1000 ml of *water*, add 1 ml of *triethylamine* and adjust the pH to 3.0 with *orthophosphoric acid* and 20 volumes of *acetonitrile*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 294 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{18}H_{20}FN_3O_4$ in infusion.

Ofloxacin Ophthalmic Solution

Ofloxacin Ophthalmic Solution is a sterile aqueous solution of Ofloxacin.

Ofloxacin Ophthalmic Solution contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ofloxacin, $C_{18}H_{20}FN_3O_4$.

Usual strength. 0.3 per cent w/w.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 6.0 to 7.2.

Sterility (2.2.11). Comply with the test for sterility.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Phosphate buffer pH 7.25 prepared by dissolving 3.56 g of *disodium hydrogen phosphate* in 1000 ml *water*, adjusted pH to 7.25 using *orthophosphoric acid* or *sodium hydroxide solution*.

Test solution. Measure accurately a volume of Opthalmic Solution containing 30 mg of Ofloxacin in 100.0 ml of solvent mixture. Dilute 1.0 ml of the solution to 10.0 with solvent mixture.

Reference solution. A 0.003 per cent w/v solution of *ofloxacin RS* in solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as TSK GEL),
- mobile phase: a mixture of 20 volumes of *acetonitrile,* 80 volumes of phosphate buffer pH 7.25 prepared by dissolving 2.54 g of *tetrabutyl ammonium hydrogen sulphate* and 3.56 g of *disodium hydrogen phosphate* in 1000 ml *water,*
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 294 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{18}H_{20}FN_3O_4$.

Storage. Store protected from light.

Ofloxacin Tablets

Ofloxacin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ofloxacin, $C_{18}H_{20}FN_3O_4$.

Usual strengths. 200 mg; 400 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1,
Medium. 900 ml of *0.1 M hydrochloride acid,*
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with the medium if necessary, at the maximum at about 294 nm (2.4.7). Calculate the content of $C_{18}H_{20}FN_3O_4$ in the medium from the absorbance obtained from a solution of known concentration of *ofloxacin RS* in the same medium.

D. Not less than 75 per cent of the stated amount of $C_{18}H_{20}FN_3O_4$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh accurately a quantity of powdered tablet containing 100 mg of Ofloxacin, disperse in 60 ml of *methanol* and dilute to 100 ml with *methanol* and filter.

Reference solution (a). A 0.1 per cent w/v solution of *ofloxacin RS* in *methanol.*

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with *methanol.*

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 8 volumes of *acetonitrile* and 92 volumes of *phosphate buffer pH 2.4* prepared by dissolving 27.2 g of *monobasic potassium phosphate* in 1000 ml of *water,* adjust the pH to 2.4 with *orthophosphoric acid,*
- flow rate. 2 ml per minute,
- spectrophotometer set at 294 nm,
- injection volume. 10 µl.

Inject reference solution (a). The test is not valid unless the column efficiency in not less than 1400 theoretical plates.

Inject the test solution and reference solution (b). Run the chromatogram three times of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the peak in the chromatogram obtained with the reference solution (b) (2.0 per cent).

Other tests. Comply with the tests stated under the Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh accurately a quantity of powdered tablet containing 25 mg of Ofloxacin, disperse in 60 ml of *methanol* and dilute to 100 ml with *methanol* and filter.

Reference solution. A 0.025 per cent w/v solution of *ofloxacin RS* in *methanol.*

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 92 volumes of buffer solution prepared by dissolving 27.2 g of *potassium dihydrogen*

phosphate in 1000 ml of *water* and adjust the pH to 2.4 with *orthophosphoric acid* and 8 volumes of *acetonitrile,*
- flow rate. 2 ml per minute,
- spectrophotometer set at 294 nm,
- injection volume. 10 µl.

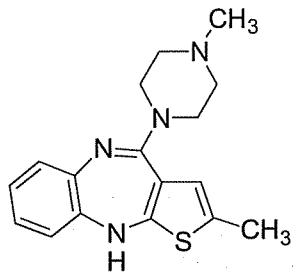
Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{18}H_{20}FN_3O_4$.

Storage. Store protected from light and moisture.

Olanzapine



$C_{17}H_{20}N_4S$ Mol. Wt. 312.4

Olanzapine is 2-methyl-4-(4-methyl-1-piperazinyl)-10*H*-thieno[2,3-*b*][1,5]benzodiazepine.

Olanzapine contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{17}H_{20}N_4S$, calculated on the anhydrous basis.

Category. Antipsychotic.

Dose. 10 mg daily.

Description. A yellow crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *olanzapine RS* or with the reference spectrum of olanzapine.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 40 volumes of *water* and 60 volumes of *acetonitrile*.

Test solution. Dissolve 50 mg of the substance under examination in 25 ml of solvent mixture.

Reference solution (a). A 0.2 per cent w/v solution of *olanzapine RS* in solvent mixture.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature. 40°,
- mobile phase: A. a mixture of 80 volumes of *buffer solution pH 6.8* prepared by dissolving 4.825 g of *sodium dihydrogen orthophosphate monohydrate* in 1000 ml of *water*, adjust pH to 6.8 with 10 per cent w/v of *sodium hydroxide* and 20 volumes of *acetonitrile*,
  B. *acetonitrile*,
- flow rate. 1.2 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume. 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
20	63	37
30	45	55
32	100	0
38	100	0

Inject reference solution (b). The test is not valid unless the tailing factor is not more than 2.0 and the column efficiency in not less than 2000 theoretical plates.

Inject the test solution and reference solution (b). In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the peak in the chromatogram obtained with the reference solution (b) (2.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 1.0 g.

Assay. Weigh accurately about 0.2 g, dissolve in 40 ml of *glacial acetic acid.* Titrate with *0.1 M perchloric acid,* determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01562 g of $C_{17}H_{20}N_4S$.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Olanzapine Tablets

Olanzapine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of olanzapine, $C_{17}H_{20}N_4S$.

Usual strengths. 2.5 mg; 5 mg; 7.5 mg; 10 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1,
Medium. 900 ml of *0.01 M hydrochloric acid*,
Speed and time. 50 rpm for 45 minutes.

Withdraw a suitable volume of the medium and filter. Determine by liquid chromatography (2.4.14).

NOTE – Protect all the solutions from light.

Test solution. Use the filtrate, if necessary dilute with dissolution medium.

Reference solution. Weigh 16 mg of *olanzapine RS*, dissolve in about 2.5 ml of *acetonitrile* and dilute to 25 ml with *0.01 M hydrochloroc acid.*Dilute suitabely to get 0.00016 per cent w/v in dissolution medium.

Chromatographic system as described under Assay, using Injection volume 50 µl.

Inject the reference solution . The test is not valid unless the tailing factor is not more than 2.0. The column efficiency is not less than 2500 theoretical plates.

Inject the test solution and the reference solution.

Calculate the content of $C_{17}H_{20}N_4S$.

D. Not less than 70 per cent of the stated amount of $C_{17}H_{20}N_4S$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Take 10 intact tablets to a suitable volumetric flask, disperse in *acetonitrile* and dilute with *0.01 M hydrochloric acid* to get a final concentration of 0.01 per cent w/v of Olanzapine.

Reference solution. Weigh 10 mg of *olanzapine RS*, dissolve in about 25 ml of *acetonitrile* and dilute to 100 ml with *0.01 M hydrochloric acid.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of *buffer solution* prepared by dissolving 3 g of *ammonium dihydrogen orthophosphate* in 900 ml *water*, add 2 ml of *triethylamine* and dilute to 1000 ml with *water.* Adjust the pH to 2.5 with *orthophosphoric acid* and 30 volumes of *methanol,*
- flow rate. 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume. 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency is not less than 2500 theoretical plates. The relative standard deviation for replicate injections is not more than 2 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{17}H_{20}N_4S$.

Storage. Store protected from light and moisture, at a temperature not exceeding 25°.

Oleic Acid

$C_{18}H_{34}O_2$ Mol. Wt. 282.5

Oleic Acid consists mainly of (*Z*)-octadec-9-enoic acid, $C_{18}H_{34}O_2$, together with varying amounts of saturated and other unsaturated fatty acids and is obtained by the hydrolysis of fats or fixed oils and separation of the liquid acids by expression or other suitable means. It may contain a suitable antioxidant.

Category. Pharmaceutical aid (emulsion adjuvant).

Description. A clear, yellowish to pale brown, oily liquid; odour, characteristic. On exposure to air it darkens in colour and the odour becomes more pronounced.

Identification

A.To 1 ml add 1 ml of *ethanol (95 per cent);* the solution is clear. It turns orange or red on addition of 0.1 ml of *methyl orange solution.*

B.Take a mixture of 1 ml of *nitric acid* and 1 ml of *water* in a test-tube with an internal diameter of about 12.5 mm and add 1 ml of the substance under examination on the surface of the mixture. Introduce 0.5 g of *copper* turnings into the lower layer and allow to stand under a hood for 4 hours; the upper layer solidifies.

C.Complies with the test for Iodine value (2.3.28).

Tests

Weight per ml (2.4.29). 0.889 g to 0.895 g.

Peroxide value (2.3.35). Not more than 10.0.

Acid value (2.3.23). 195 to 202, determined on 0.5 g.

Iodine value (2.3.28). 85 to 95, determined by Method A.

Water-soluble acids. Shake 5 ml with 5 ml of *water* for 2 minutes, allow the liquids to separate and filter the aqueous layer through paper moistened with *water*. To the filtrate add 0.05 ml of *methyl orange solution*; the liquid does not become red.

Neutral fats and mineral oils. Boil 1 ml with 5 ml of *0.5 M sodium carbonate* and 25 ml of water in a large flask. The solution, while still hot, is not more opalescent than opalescence standard OS2 (2.4.1).

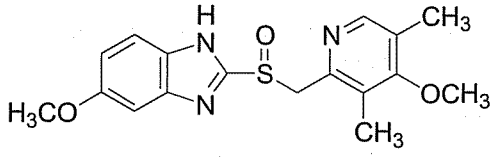
Congealing point. Dry about 10 ml by heating to 110° with frequent stirring, transfer to a test-tube about 20 mm in diameter, cool and when at 15° immerse the tube in a suitable water-bath so that the cooling takes place at the rate of 2° per minute. Stir the sample with a thermometer; it does not become cloudy until the temperature has fallen to 10°. On further cooling it congeals to a white solid or semi-solid mass at about 4°.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Storage. Store protected from light and moisture in a refrigerator (8° to 15°).

Labelling. The label states (1) where applicable, that it is used for external use only; (2) the name and concentration of any added antioxidant.

Omeprazole



$C_{17}H_{19}N_3O_3S$ Mol. Wt. 345.4

Omeprazole is 5-methoxy-2-[[(4-methoxy-3,5-dimethylpyridin-2-yl)methyl]sulfinyl]-1*H*-benzimidazole.

Omeprazole contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{17}H_{19}N_3O_3S$, calculated on the dried basis.

NOTE — Perform the tests and assay in subdued light and use low-actinic glassware.

Category. Antiulcerative (proton pump inhibitor).

Dose. For duodenal and gastric ulcers and for reflux oesophagitis, 20 to 40 mg daily; for Zollinger-Ellison syndrome, initially 60 mg once daily; usual range, 20 to 120 mg daily.

Description. A white or almost white powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *omeprazole RS* or with the reference spectrum of omeprazole.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.002 per cent w/v solution in *0.1 M sodium hydroxide* shows absorption maxima at about 276 nm and 305 nm; the ratio of the absorbance at about 305 nm to that at about 276 nm, 1.6 to 1.8.

C. In the test for Related substances, the principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

Tests

Appearance of solution. A 2.0 per cent w/v solution in *dichloromethane* is clear (2.4.1).

Light absorption (2.4.7). Absorbances of a freshly prepared 2.0 per cent w/v solution in *dichloromethane* at 400 nm, 500 nm and 600 nm are not more than 0.25, 0.10 and 0.10 respectively.

Related substances. A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 50 volumes of *benzene*, 30 volumes of *ethyl acetate* and 10 volumes of *methanol*.

Test solution. Dissolve 0.4 g of the substance under examination in 100 ml of *ethanol*.

Reference solution (a). A 0.4 per cent w/v solution of *omeprazole RS* in *ethanol*.

Reference solution (b). A 0.004 per cent w/v solution of *omeprazole RS* in *ethanol*.

Reference solution (c). A 0.002 per cent w/v solution of *omeprazole RS* in *ethanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm immediately. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (c) and the total intensity of all such spots in the chromatogram obtained with the test solution is not more than the intensity of the spot obtained with reference solution (b).

B. In the Assay, the sum of the areas of all the secondary peaks is not greater than 1.5 per cent of the total area of all peaks.

Heavy metals (2.3.13). The residue obtained in the test for Sulphated ash, complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 0.2 per cent, determined on 1.0 g by drying in an oven at 60° at a pressure not exceeding 0.7 kPa for 4 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. A 0.005 per cent w/v solution of the substance under examination in the mobile phase.

Reference solution. A 0.005 per cent w/v solution of *omeprazole RS* in the mobile phase.

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of *phosphate buffer pH 7.4* and 35 volumes of *acetonitrile*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 302 nm,
- injection volume. 20 µl.

Inject the reference solution. Repeat the procedure at least five times and measure the peak responses of the peak due to omeprazole. The relative standard deviation of the replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{17}H_{19}N_3O_3S$.

Storage. Store protected from light and moisture in a refrigerator (2° to 8°).

NOTE — A combination of elevated temperatures (37°-50°) and high humidity degrades Omeprazole. It rapidly degrades under acidic conditions.

Omeprazole Capsules

Omeprazole Capsules contain enteric-coated granules of Omeprazole.

Omeprazole Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of omeprazole, $C_{17}H_{19}N_3O_3S$.

NOTE — Perform the tests and assay in subdued light and use low-actinic glassware.

Usual strength. 20 mg.

Identification

A.To a quantity of the contents of the capsules containing 50 mg of Omeprazole in a 100-ml volumetric flask add about 70 ml of *0.1 M sodium hydroxide*. Mix in an ultrasonic bath for about 5 minutes and heat on a water-bath for 10 minutes. Cool, make up to volume with *0.1 M sodium hydroxide* and filter. Dilute 2 ml of the filtrate to 100 ml with *0.1 M sodium hydroxide*.

When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows absorption maxima at about 276 nm and 305 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to omeprazole in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

A. Apparatus No. 1,
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 100 rpm and 2 hours.

Tap the granules from a capsule slightly with a glass rod to make them settle to the bottom. Rotate the paddle at 100 rpm for 2 hours, drain the solution slowly without losing any granules. Transfer them quantitatively to a 100-ml volumetric flask, add 20 ml of *0.1 M sodium hydroxide* and mix with the aid of ultrasound. Dilute to volume with *0.1 M sodium hydroxide*, centrifuge about 15 ml for 5 minutes and dilute 5.0 ml of the clear supernatant liquid to 50.0 ml with the mobile phase. Using the resulting solution as the test solution, carry out the determination as described in the Assay. Calculate the content of $C_{17}H_{19}N_3O_3S$ in the supernatant liquid. Calculate the percentage of omeprazole released in the acid medium by subtracting the content of $C_{17}H_{19}N_3O_3S$ in the test solution from the total content of omeprazole determined in the Assay.

Not more than 15 per cent of the stated amount of $C_{17}H_{19}N_3O_3S$ is dissolved in 2 hours.

B. Apparatus No. 1,
Medium. 900 ml of *phosphate buffer pH 6.8*,
Speed and time. 100 rpm and 45 minutes.

Tap the granules from a capsule slightly with a glass rod to make them settle to the bottom. Rotate the paddle at 100 rpm for 45 minutes and filter the solution. Using the filtered medium as the test solution, carry out the determination as described in the Assay. Calculate the content of $C_{17}H_{19}N_3O_3S$ in the medium.

D. Not less than 70 per cent of the stated amount of $C_{17}H_{19}N_3O_3S$.

Other tests. Comply with the tests stated under Capsules.

Loss on drying (2.4.19). Not more than 3.0 per cent, determined on 0.5 g of the contents of the capsules by drying in an oven at 60° at a pressure not exceeding 0.7 kPa for 4 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Mix the contents of 20 capsules. Weigh and transfer the granules containing about 20 mg of Omeprazole to a 100-ml volumetric flask, add 20 ml of *0.1 M sodium hydroxide*, mix with the aid of ultrasound and dilute to volume with *0.1 M sodium hydroxide*. Centrifuge for 5 minutes and dilute 5.0 ml of the clear supernatant liquid to 50.0 ml with the mobile phase.

Reference solution. Take 20 mg of *omeprazole RS* in a dry, stoppered test-tube, add 20.0 ml of *0.1 M sodium hydroxide*, shake vigorously for 5 minutes and dilute 1.0 ml of the solution with the mobile phase to produce 50.0 ml.

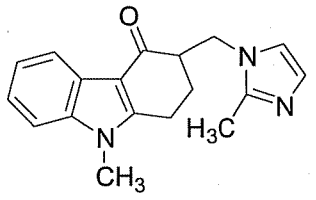
Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of *phosphate buffer pH 7.4* and 35 volumes of *acetonitrile,*
- flow rate. 1 ml per minute,
- spectrophotometer set at 302 nm,
- injection volume. 20 µl.

Inject the reference solution. Repeat the procedure at least five times and measure the peak responses of the peak due to omeprazole. The relative standard deviation of the replicate injections is not more than 2.0 per cent.

Calculate the content of $C_{17}H_{19}N_3O_3S$ in the capsules.

Storage. Store protected from light and moisture.

Ondansetron Hydrochloride



, HCl, $2H_2O$

$C_{18}H_{19}N_3O$, HCl, $2H_2O$ Mol. Wt. 365.9

Ondansetron Hydrochloride is (*RS*)-9-methyl-3-[(2-methyl-1*H*-imidazol-1-yl)methyl]-1,2,3,9-tetrahydro-4*H*-carbazol-4-one hydrochloride dihydrate.

Ondansetron Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{18}H_{19}N_3O$,HCl, calculated on the anhydrous basis.

Category. Antiemetic. (5-HT_3 receptor antagonist)

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6).Compare the spectrum with that obtained with *ondansetron hydrochloride RS* or with the reference spectrum of ondansetron hydrochloride.

B. It gives the reactions of chlorides (2.3.12).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Use the chromatographic system, the test solution and reference solution (b) described under Assay.

Inject the test solution and reference solution (b). In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.2 times the area of the peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 0.5 times the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 9.0 to 10.5 per cent, determined on 0.2 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 50 ml of the mobile phase and filter. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (a). A 0.01 per cent w/v solution of *ondansetron hydrochloride RS* in the mobile phase.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100.0 ml with the mobile phase.

Reference solution (c). A solution containing 0.01 per cent w/v of *ondansetron hydrochloride RS* and 0.002 per cent w/v of *3[Dimethylaminomethyl]-1, 2, 3, 9-tetrahydro-9-methyl-4H-carbozol-4-one RS* (*ondansetron impurity A RS*) in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with porous silica (5 µm) with chemically bonded nitrile groups (Such as Supelco LC-CN),
- mobile phase: a mixture of 50 volumes of *0.02 M monobasic potassium phosphate* with the pH previously adjusted to 5.4 with *1 M sodium hydroxide* and 50 volumes of *acetonitrile*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 216 nm,
- injection volume. 10 µl.

Inject reference solution (c). The test is not valid unless the relative retention time for ondansetron is about 1.0 and for ondansetron impurity A is about 1.1. The resolution between ondansetron and ondansetron impurity A is not less than 1.5.

Inject reference solution (a). The tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and reference solution (a).

Calculate the content of $C_{18}H_{19}N_3O$,HCl.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Ondansetron Injection

Ondansetron Hydrochloride Injection

Ondansetron Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of ondansetron, $C_{18}H_{19}N_3O$.

Usual strengths. 2 mg; 4 mg; 8 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution (a).

Tests

pH (2.4.24). 3.3 to 4.0.

Related substances. Determine by liquid chromatography (2.4.14).

Use the chromatographic system, test solution and reference solution (b) described under Assay.

Inject the test solution and reference solution (b). In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.2 times the area of the peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 1.5 times the area of the peak in the chromatogram obtained with reference solution (b) (1.5 per cent).

Bacterial endotoxins (2.2.3). Not more than 9.9 Endotoxin Units per mg of ondansetron.

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution.Transfer an accurately measured volume of the injection containing about 2 mg of ondansetron to a 25-ml volumetric flask, dilute to volume with the mobile phase and mix.

Reference solution (a). A 0.01 per cent w/v solution of *ondansetron hydrochloride RS* in the mobile phase.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with the mobile phase.

Reference solution (c). A solution containing 0.01 per cent w/v of *ondansetron hydrochloride RS* and 0.005 per cent w/v of *3[Dimethylaminomethyl]-1, 2, 3, 9-tetrahydro-9-methyl-4H-carbozol-4-one RS (ondansetron impurity A RS)* in the mobile phase.

Chromatographic system

- a stainless steel column 20 cm x 4.6 mm, packed with porous silica (5 µm) bonded to nitrile groups (such as Supelco LC-CN),
- mobile phase: a mixture of 50 volumes of *0.02 M monobasic potassium phosphate* with the pH previously adjusted to 5.4 with *1 M sodium hydroxide* and 50 volumes of *acetonitrile*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 216 nm,
- injection volume. 10 µl.

Inject reference solution (c). The test is not valid unless the relative retention time for ondansetron is about 1.0 and for ondansetron impurity A is about 1.1. The resolution between ondansetron and ondansetron impurity A is not less than 1.5.

Inject reference solution (a). The tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and reference solution (a).

Calculate the content of $C_{18}H_{19}N_3O$ in the injection.

Storage. Store protected from light, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of ondansetron.

Ondansetron Orally Disintegrating Tablets

Ondansetron Orally Disintegrating Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ondansetron, $C_{18}H_{19}N_3O$.

Usual strength. 4 mg; 8 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1,

Medium. 500 ml of *0.1 M hydrochloric acid,*
Speed and time. 50 rpm and 10 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted with the dissolution medium if necessary, at the maximum at about 310 nm (2.4.7). Calculate the content of $C_{18}H_{19}N_3O$ in the medium from the absorbance obtained by using a solution of known concentration of *ondansetron RS* in same medium.

D. Not less than 80 per cent of the stated amount of $C_{18}H_{19}N_3O$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing about 40 mg of ondansetron with 100.0 ml of the mobile phase. Centrifuge a portion of this solution at 3000 rpm for 10 minutes. Use the supernatant.

Reference solution (a). A 0.004 per cent w/v solution of *1,2,3,9-tetrahydro-9-methyl-3-methylene-4H-carbazol-4-one RS (ondansetron impuirty D RS)* in *acetonitrile.*

Reference solution (b). A 0.004 per cent w/v solution of *2-methylimidazole* in *acetonitrile.*

Reference solution (c). A 0.004 per cent w/v solution of *ondansetron RS* in *acetonitriile.*

Reference solution (d). Dilute 5.0 ml of reference solution (c) to 100.0 ml with the mobile phase.

Reference solution (e). Dilute 10.0 ml of reference solution (c) to 100.0 ml with the mobile phase.

Reference solution (f). Transfer 5.0 ml of each reference solution (a), (b) and (c) to a 100-ml volumetric flask, dilute to volume with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with porous silica chemically bonded to nitrile groups (5 µm),
- mobile phase: a mixture of 80 volumes of phosphate buffer prepared by dissolving 2.72 g of *monobasic potassium phosphate* in 1000 ml of *water*, adjusted to pH 5.4 with *1 M sodium hydroxide* and 20 volumes of *acetonitrile*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 216 nm,
- injection volume. 20 µl.

Inject reference solution (f). The test is not valid unless the resolution between ondansetron and adjacent peak is not less than 1.5, the theoretical plates is not less than 8000 for ondansetron and tailing factor is not more than 2.0.

Inject reference solution (e). The signal to noise ratio for the ondansetron peak is not less than 15. The relative retention time with reference to ondansetron for 2-methylimidazole is about 0.16 and for ondansetron impurity D is about 0.45.

Inject reference solution (d) and the test solution. In the chromatogram obtained with the test solution, the area of the peak due to 2-methylimidazole is not more than 0.15 per cent, multiply with response factor 0.5, the area of peak due to ondansetron impurity D is not more than 0.12 per cent, multiply with response factor 1.2. The area of any other secondary peak is not more than 0.1 per cent and the sum of all the secondary peaks is not more than 0.5 per cent.

Water (2.3.43). Not more than 4.0 per cent, determined on 1.0 g.

Other tests. Comply with the tests stated under tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing about 40 mg of ondansetron with 100.0 ml *0.01 M hydrochloric acid.* Dilute 1.0 ml of the solution to 10.0 ml with *0.01 M hydrochloric acid.*

Reference solution (a). A 0.004 per cent w/v solution of *ondansetron RS* in *0.01 M hydrochloric acid.*

Reference solution (b). A 0.014 per cent w/v solution of *3[Dimethylamino methyl]-1,2,3,9-tetrahydro-9-methyl-H-carbozol-4-one-RS (ondansetron impurity A RS)* in *0.01 M hydrochloric acid.*

Reference solution (c). Transfer 8.0 ml each of reference solution (a) and (b) to 50-ml volumetric flask and dilute to volume with *0.01 M hydrochloric acid.*

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with porous silica bonded to nitrile groups (5 µm),
- mobile phase: a mixture of 52 volumes of 0.272 per cent w/v solution of *monobasic potassium phosphate,* adjusted to pH 5.4 with *1 M sodium hydroxide* and 48 volumes of *acetonitrile*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 216 nm,
- injection volume. 10 µl.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to ondansetron and ondansetron impurity A is not less than 1.5. The relative retention time with reference to ondansetron for ondansetron impurity A is about 1.1. The tailing factor is not more than 2.0 for ondansetron peak.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{18}H_{19}N_3O$ in the tablets.

Storage. Store protected form light and moisture, at a temperature not exceeding 30°.

Labelling. The label states the active ingredient in terms of equivalent amount of ondansetron.

Ondansetron Oral Solution

Ondansetron Hydrochloride Oral Solution

Ondansetron Oral Solution is a solution of Ondansetron Hydrochloride in a suitable vehicle.

Ondansetron Oral Solution contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of ondansetron, $C_{18}H_{19}N_3O$.

Usual strength. 2 mg per 5 ml; 4 mg per 5 ml.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 90 volumes of *chloroform*, 50 volumes of *ethyl acetate*, 40 volumes of *methanol* and 1 volume of *ammonium hydroxide*.

Test solution. Dilute an accurately measured volume of the oral solution containing about 20 mg of ondansetron to 100.0 ml in a mixture of 50 volumes of *methanol* and 50 volumes of *water*.

Reference solution. A 0.025 per cent w/v solution of *ondansetron RS* in *methanol*.

Apply 10 µl of each solution. Allow the solvent front to rise 15 cm. Dry the plate in air and examine in ultraviolet light at 254 nm. The chromatogram obtained with the test solution corresponds to that obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 3.3 to 4.0.

Ondansetron impurity D. Not more than 0.1 per cent.

Determine by liquid chromatography (2.4.14).

Test solution. Dilute an accurately measured volume of oral solution to obtain a solution having a concentration of 0.08 per cent w/v of ondansetron in the mobile phase.

Reference solution (a). A 0.00005 per cent w/v solution of *1,2,3,9-tetrahydro-9-methyl-3-methylene-4H-carbazol-4-one RS* (*ondansetron impurity D RS*) in the mobile phase.

Reference solution (b). A solution containing 0.00005 per cent w/v of *ondansetron impurity D RS* and 0.0002 per cent w/v of *N-methyl[2-(2-methylbenzhydryloxy)ethyl]amine hydrochloride RS (ondansetron impurity C RS)* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with porous silica bonded to nitrile groups (5 µm),
- mobile phase: a mixture of 80 volumes of *0.02 M monobasic potassium phosphate,* previously adjusted to pH 5.4 and 20 volumes of *acetonitrile,*
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 328 nm,
- injection volume. 20µl.

Inject reference solution (b). The test is not valid unless the resolution between ondansetron impurity D and ondansetron impurity C is not less than 2.0, the tailing factor for ondansetron impurity D is not more than 2.0 and the relative standard deviation for replicate injections is not more than 4.0 per cent.

Inject reference solution (a) and the test solution.

Calculate the content of ondansetron impurity D in the oral solution.

Related substances. Determine by liquid chromatography (2.4.14), as described under Assay with the following modifications.

Test solution. Weigh accurately a quantity of oral solution containing about 45 mg of Ondansetron Hydrochloride in 50-ml volumetric flask, dissolve and dilute with the mobile phase and mix. Dilute 5.0 ml of this solution to 50 ml with the mobile phase.

Inject reference solution (c). The test is not valid unless the resolution between ondansetron impuirty A and ondansetron is not less than 1.5, the tailing factor is not less than 2.0 and the relative standard deviation for replicate injections is not more than 1.5 per cent. The relative retention time with reference to ondansetron for ondansetron impurity A is about 1.1.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of the peak due to ondansetron impurity D is not more than 0.1 per cent, the area of each peak due to imidazole, 2-methyl imidazole, des-(-methyl)ondansetron hydrochloride, N-Desmethyl ondansetron maleate, ondansetron impurity A is not more than 0.2 per cent. The area of any other secondary peak is not more than 0.2 per cent and the sum of all the secondary peaks is not more than 0.5 per cent.

Other tests. Complies with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of the oral solution containing about 9 mg of ondansetron to 100.0 ml with the mobile phase.

Reference solution (a). A 0.01 per cent w/v solution of *ondansetron hydrochloride RS* in the mobile phase.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100.0 ml with the mobile phase.

Reference solution (c). A solution containing 0.01 per cent w/v of *ondansetron hydrochloride RS* and 0.002 per cent w/v of *3[Dimethylaminomethyl]-1, 2, 3, 9-tetrahydro-9-methyl-4H-carbozol-4-one RS* (*ondansetron impurity A RS*) in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with porous silica (5 µm) with chemically bonded nitrile groups (such as Supelco LC-CN),
- mobile phase: a mixture of 50 volumes of *0.02 M monobasic potassium phosphate* with the pH previously adjusted to 5.4 with *1 M sodium hydroxide* and 50 volumes of *acetonitrile*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 216 nm,
- injection volume. 10 µl.

Inject reference solution (c). The test is not valid unless the relative retention time for ondansetron is about 1.0 and for ondansetron impurity A is about 1.1. The resolution between ondansetron and ondansetron impurity A is not less than 1.5.

Inject reference solution (a). The tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and reference solution (a).

Calculate the content of $C_{18}H_{19}N_3O$, HCl in the oral solution.

Microbial contamination (2.2.9). Complies with the microbial contamination test. The total aerobic count is not more than 100 cfu per g, *Enterobacteriaceae* count is not more than 10 cfu per g and the total combined molds and yeasts count is not more than 50 cfu per g.

Storage. Store protected from light and moisture.

Ondansetron Tablets

Ondansetron Hydrochloride Tablets

Ondansetron Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of ondansetron, $C_{18}H_{19}N_3O$.

Usual strengths. 2 mg; 4 mg; 8 mg

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution (a).

Tests

Dissolution (2.5.2)

Apparatus No. 1,

Medium. 500 ml of *water*,

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the medium if necessary, at the maximum at about 310 nm (2.4.7). Calculate the content of $C_{18}H_{19}N_3O$ in the medium from the absorbance obtained from a solution of known concentration of *ondansetron hydrochloride dihydrate RS* in the same medium.

1 mg of $C_{18}H_{19}N_3O$ is equivalent to 1.25 mg of $C_{18}H_{19}N_3O,HCl,2H_2O$.

D. Not less than 70 per cent of the stated amount of $C_{18}H_{19}N_3O$.

Related substances. Determine by liquid chromatography (2.4.14).

Use the chromatographic system, test solution and reference solution (b) described under Assay.

Inject the test solution and reference solution (b). In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.2 times the area of the peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 0.5 times the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent).

Uniformity of content. Comply with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), using the chromatographic conditions and reference solution (a) described in the Assay.

Test solution. Disperse one tablet in the mobile phase and dilute to obtain a solution containing 0.01 per cent w/v of Ondanseteron Hydrochloride and filter.

Calculate the content of $C_{18}H_{19}N_3O$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh accurately a quantity of powder containing about 50 mg of ondansetron, disperse in 50 ml of the mobile phase and filter. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (a). A 0.01 per cent w/v solution of *ondansetron hydrochloride RS* in the mobile phase.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with the mobile phase.

Reference solution (c). A solution containing 0.01 per cent w/v of *ondansetron hydrochloride RS* and 0.002 per cent w/v of *3[Dimethylaminomethyl]-1, 2, 3, 9-tetrahydro-9-methyl-4H-carbozol-4-one RS* (*ondansetron impurity A RS*) in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with porous silica (5 µm) bonded to nitrile groups (such as Supelco LC-CN),
- mobile phase: a mixture of 50 volumes of *0.02 M monobasic potassium phosphate* with the pH previously adjusted to 5.4 with *1 M sodium hydroxide* and 50 volumes of *acetonitrile*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 216 nm,
- injection volume. 10 µl.

Inject reference solution (c). The test is not valid unless the relative retention time for ondansetron is about 1.0 and for ondansetron impurity A is about 1.1. The resolution between ondansetron and ondansetron impurity A is not less than 1.5.

Inject reference solution (a). The tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and reference solution (a).

Calculate the content of $C_{18}H_{19}N_3O$ in the tablets.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of ondansetron.

Oral Rehydration Salts

ORS Powder

Oral Rehydration Salts are dry, homogeneously mixed powders containing Dextrose, Sodium Chloride, Potassium Chloride and either Sodium Bicarbonate or Sodium Citrate for use in oral rehydration therapy after being dissolved in the requisite amount of water.

They may contain suitable flavouring agents and, where necessary, suitable flow agents in the minimum quantity required to achieve a satisfactory product but may not contain artificial sweetening agents like mono- and/or poly-saccharides. If saccharin/saccharin sodium or aspartame is used in preparations meant for paediatric use, the concentration of saccharin should be such that its daily intake is not more than 5 mg/kg of body weight and that of aspartame should be such that its daily intake is not more than 40 mg/kg of body weight.

Category: Replacement solution for diarrhoeal rehydration.

Usual strength. A formulation of reduced osmolarity (given below) recommended by the World Health Organization (WHO) for the Diarrhoeal Diseases Control Programme, and of the United Nations Children's Emergency Fund (UNICEF).

Composition of the formulation in terms of the amount, in g, to be dissolved in sufficient water to produce 1000 ml.

Sodium Chloride	2.6
Dextrose (anhydrous)	13.5
or	
Dextrose Monohydrate	14.85
Potassium Chloride	1.5
Sodium Citrate	2.9

The molar concentrations of sodium, potassium, chloride and citrate ions in terms of millimoles per litre are given below:

	mmol/l
Sodium	75
Potassium	20
Chloride	65
Citrate	10
Dextrose	75

The total osmolar concentration of the solution in terms of mOsmol per litre is 245.

Oral Rehydration Salts contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of Dextrose (anhydrous) or Dextrose Monohydrate (as appropriate) and of the requisite amounts of sodium, Na, potassium, K, chloride, Cl, and citrate, $C_6H_5O_7$, calculated from the stated amounts of the relevant constituents.

Description. A white to creamy-white, amorphous or crystalline powder; odourless.

Identification

A. When heated, melting and charring occurs and an odour of burnt sugar is produced.

B. Add a few drops of the solution prepared as directed in the label to 5 ml of *potassium cupri-tartrate solution*; a copious red precipitate is produced on boiling.

C. Gives reaction A of sodium salts, reaction A of potassium salts and reaction A of chlorides (2.3.1).

D. A quantity containing about 50 mg of *citric acid* gives the reactions of citrates (2.3.1).

Tests

Uniformity of weight. Comply with the test for contents of packaged dosage forms (2.5.6).

Seal test (*only for sachets*). Loosely bundle 10 sachets with a rubber band and submerge the bundle under water in a vacuum desiccator maintained at a pressure not exceeding 18 kPa for one minute. Examine the bundle for any fine stream of bubbles. Re-establish normal pressure and open the bundle. No penetration of water is observed in any sachet.

Other tests. Comply with the tests stated under Oral Powders.

Assay. Carry out the following assays on the well-mixed contents of an individual sachet or on a suitable sample from the well-mixed contents of a bulk container. Where the amount in an individual sachet is insufficient to carry out all the assays, take a separate sachet for the Assay for citrate and for the Assay for dextrose. For the Assays for total sodium, for potassium and for total chloride weigh accurately about 8.0 g and dissolve in sufficient *water* to produce 500.0 ml (solution A).

For total sodium — Dilute a suitable volume of solution A with a sufficient volume of a solution of *strontium chloride* such that the final solution contains a 1500 to 2000-fold excess of strontium ions and determine by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 589 nm and using *sodium solution AAS*, suitably diluted with the *strontium chloride solution*, for the standard solutions or, alternately by Method A for flame photometry (2.4.4).

1 g of Sodium Chloride, and of Sodium Citrate is equivalent to 0.3934 and 0.2345 g of Na respectively.

For potassium — Dilute a suitable volume of solution A with a sufficient volume of solution of *strontium chloride* such that the final solution contains a 1500 to 2000-fold excess of strontium ions and determine by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 767 nm and using *potassium solution AAS*, suitably diluted with the *strontium chloride solution*, for the standard solutions or, alternatively by Method A for flame photometry (2.4.4).

1 g of Potassium Chloride is equivalent to 0.5245 g of K.

For total chloride — Titrate 50 ml of solution A with *0.1 M silver nitrate* using *potassium chromate solution* as indicator.

1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of Cl.

1 g of Sodium Chloride, and of Potassium Chloride is equivalent to 0.6066 and 0.4756 g of Cl respectively.

For citrate — Weigh accurately about 2.0 g and dissolve in 50 ml of *anhydrous glacial acetic acid* by heating at about 50°. Cool, allow to stand for 10 minutes. Titrate with *0.1 M perchloric acid*, using *1-naphtholbenzein solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.006303 g of $C_6H_5O_7$.

1 g of Sodium Citrate is equivalent to 0.6430 g of $C_6H_5O_7$.

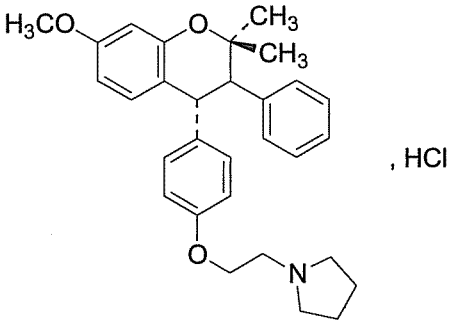
For dextrose — Weigh accurately about 7.5 g, dissolve in 40 ml of *water*, add 0.5 ml of *dilute ammonia solution*, and dilute to 50 ml with *water*. Mix well, allow to stand for 30 minutes, filter the solution, if turbid, and measure the optical rotation in a 2-dm tube (2.4.22). The observed rotation, in degrees, multiplied by 0.9477 and 1.0424 represents the weight in g of $C_6H_{12}O_6$ and $C_6H_{12}O_6,H_2O$ respectively, as appropriate, in the weight taken for the Assay.

Storage. Store protected from moisture in sachets, preferably made of aluminum foil, containing sufficient powder for a single dose or for a day's treatment or for use in hospitals, in bulk containers containing sufficient quantity to produce a volume of solution appropriate to the daily requirements of the hospital concerned.

Labelling. The label states (1) for sachets, the total weights, in g, of each constituent; (2) for bulk containers, the weights, in g, of each constituent in a stated quantity, in g, of the oral powder; (3) the molar concentration in millimoles per litre of sodium, potassium, chloride and citrate ions, and of dextrose as well as the total osmolar concentration in mOsmol per litre of the solution prepared from the oral powder; (4) the total weight of the contents of the container; (5) the directions for use; (6) that any portion of the solution prepared from the oral powder that remains unused for 24 hours after preparation should be discarded; (7) the storage conditions. g, of the oral powder.

Ormeloxifene Hydrochloride

Centchroman Hydrochloride; Centchroman



, HCl

$C_{30}H_{35}NO_3,HCl$ Mol. Wt. 493.5

Ormeloxifene Hydrochloride is *trans*-7-methoxy-2,2-dimethyl-3-phenyl-4[4-(2-pyrrolidinoethoxy)phenyl]chroman hydrochloride.

Ormeloxifene Hydrochloride contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{30}H_{35}NO_3,HCl$, calculated on the dried basis.

Category. Antifertility agent (female oral contraceptive).

Dose. 120 mg twice a week, 3 days apart, for three months and thereafter once a week.

Description. A white to off-white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ormeloxifene hydrochloride RS* or with the reference spectrum of ormeloxifene.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.01 per cent w/v solution in *methanol* shows absorption maxima at about 278 and 282 nm.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G.*

Mobile phase. A mixture of 90 volumes of *chloroform* and 10 volumes of *methanol.*

Test solution. Dissolve 0.25 g of the substance under examination in 100 ml of *chloroform.*

Reference solution. A 0.25 per cent w/v solution of *ormeloxifene hydrochloride RS* in *chloroform.*

Apply to the plate 2 µl of each solution. After development, dry the plate in air, until the odour of the solvents is no longer detectable and spray with a 0.3 per cent w/v solution of *potassium permanganate.* The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

D. To 1 ml of a 2 per cent w/v solution in *ethanol (95 per cent)* add 1 ml of a saturated solution of *picric acid* in *water*, stir well and set aside for 5 minutes. The yellow precipitate obtained after washing with *water* and drying at 60° for 4 hours melts at 212° to 218° (2.4.21).

Tests

Total basic substances. Weigh accurately 0.5 g, dissolve in 25 ml of *anhydrous glacial acetic acid*, add 10 ml of a 5 per cent w/v solution of *mercuric acetate* in *anhydrous glacial acetic acid.* Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator to a bluish green end-point. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04935 g of $C_{30}H_{35}NO_3,HCl$.

cis-Isomer. *Not more than 1.5 per cent of the total content of hydrochlorides of trans-and cis-isomers determined in the Assay.*

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 3.5 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. A 0.004 per cent w/v solution of the substance under examination in the mobile phase.

Reference solution. A solution containing 0.004 per cent w/v of *trans-ormeloxifene hydrochloride RS* and 0.0006 per cent w/v of *cis-ormeloxifene hydrochloride RS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: 80 volumes of *acetonitrile* and 20 volumes of *water* containing 0.04 per cent w/v solution of *tetramethylammonium hydroxide* adjusted to pH 7.6 with *phosphoric acid,*
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume. 20 µl.

Inject the reference solution and use an attenuation such that the response for the principal peak due to trans-ormeloxifene hydrochloride is more than 50 per cent of the full-scale deflection of the recorder. Make a total of six injections. When the chromatograms are recorded under the conditions described above, trans-ormeloxifene hydrochloride is eluted before cis-ormeloxifene hydrochloride.The test is not valid unless the relative standard deviation of six replicate injections is not greater than 6 per cent and the resolution between the peaks due to cis-ormeloxifene hydrochloride and trans-ormeloxifene hydrochloride is greater than 1. If necessary, adjust the proportions and the flow rate of the mobile phase to obtain proper resolution. Inject a suitable volume of test solution and record the response. From the average peak areas of the six replicate analyses calculate the content of trans-ormeloxifene hydrochloride and cis-ormeloxifene hydrochloride in the substance under examination by comparing with the peak responses for trans-ormeloxifene hydrochloride and cis-ormeloxifene hydrochloride respectively obtained with reference solution.

Storage. Store protected from moisture.

Ormeloxifene Hydrochloride Tablets

Centchroman Hydrochloride Tablets; Centchroman Tablets

Ormeloxifene Hydrochloride Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of Ormeloxifene hydrochloride, $C_{30}H_{35}NO_3,HCl$.

Usual strength. 30 mg.

Identification

Shake a quantity of the powdered tablets containing 0.1 g of Ormeloxifene Hydrochloride with 10 ml of *chloroform*, filter and evaporate the filtrate to dryness at a pressure not exceeding 0.7 kPa. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ormeloxifene*

hydrochloride RS or with the reference spectrum of ormeloxifene.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.01 per cent w/v solution in *methanol* shows absorption maxima at about 278 and 282 nm.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G.*

Mobile phase. A mixture of 90 volumes of *chloroform* and 10 volumes of *methanol.*

Test solution. Dissolve 0.25 g of the substance under examination in 100 ml of *chloroform.*

Reference solution. A 0.25 per cent w/v solution of *ormeloxifene hydrochloride RS* in *chloroform.*

Apply to the plate 2 µl of each solution. After development, dry the plate in air, until the odour of the solvents is no longer detectable and spray with a 0.3 per cent w/v solution of *potassium permanganate.* The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2,
Medium. 900 ml of *water,*
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted if necessary, at the maximum at about 278 nm (2.4.7). Calculate the content of $C_{30}H_{35}NO_3$,HCl in the medium from the absorbance obtained from a solution of known concentration of *Ormeloxifene hydrochloride RS* in *water.*

D. Not less than 70 per cent of the stated amount of $C_{30}H_{35}NO_3$,HCl.

cis-Isomer. *Not more than 1.5 per cent of the total content of ormeloxifene hydrochlorides of trans- and cis-isomers determined in the Assay.*

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.17).

Test solution. Weigh and powder 20 tablets. Shake a quantity of the powder containing 0.1 g of Ormeloxifene Hydrochloride with three quantities, each of 5 ml, of *methanol,* centrifuge each extract, dilute the combined extracts to 25 ml with *methanol* and then dilute 250 µl of the resulting solution to 25 ml with the mobile phase.

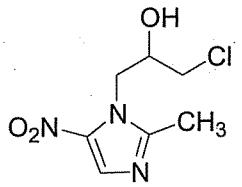
Reference solution. A solution containing 0.004 per cent w/v of *trans-ormeloxifene hydrochloride RS* and 0.0006 per cent w/v of cis-*ormeloxifene hydrochloride RS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: 80 volumes of *acetonitrile* and 20 volumes of *water* containing 0.04 per cent w/v solution of *tetramethylammonium hydroxide* adjusted to pH 7.6 with *phosphoric acid,*
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume. 20 µl.

Inject the reference solution and use an attenuation such that the response for the principal peak due to trans-ormeloxifene hydrochloride is more than 50 per cent of full-scale deflection of the recorder. Make a total of six injections. When the chromatograms are recorded under the conditions described above, trans-ormeloxifene hydrochloride is eluted before cis-ormeloxifene hydrochloride.The test is not valid unless the relative standard deviation of six replicate injections is not greater than 6 per cent and the resolution between the peaks due to cis-ormeloxifene hydrochloride and trans-ormeloxifene hydrochloride is greater than 1. If necessary, adjust the proportions and the flow rate of the mobile phase to obtain proper resolution. Inject a suitable volume of test solution and record the response. From the average peak areas of the six replicate analyses calculate the content of trans-ormeloxifene hydrochloride and cis-ormeloxifene hydrochloride in the substance under examination.

Storage. Store protected from moisture.

Ornidazole



$C_7H_{10}ClN_3O_3$ Mol. Wt. 219.6

Ornidazole is (*RS*)-1-chloro-3-(2-methyl-5-nitroimidazol-1-yl)propan-2-ol.

Ornidazole contains not less than 98.0 per cent and not more than 101.0 per cent of $C_7H_{10}ClN_3O_3$, calculated on the anhydrous basis.

Category. Antiamoebic.

Dose. 500 mg twice a day orally for five days.

Description. A white to yellowish white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ornidazole RS* or with the reference spectrum of ornidazole.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.002 per cent w/v solution in *0.1 M hydrochloric acid* shows an absorption maximum at about 277 nm; absorbance at 277 nm, 0.580 to 0.630.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 25.0 ml of the mobile phase.

Reference solution (a). A 0.001 per cent w/v solution of *2-methyl-5-nitroimidazole RS* in the mobile phase.

Reference solution (b). A 0.001 per cent w/v solution of *ornidazole RS* in the mobile phase.

Reference solution (c). Dilute 20.0 ml of reference solution (a) and 1.0 ml of reference solution (b) to 200.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of *0.01M potassium dihydrogen orthophosphate* and 30 volumes of *methanol*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 318 nm,
- injection volume. 20 µl.

Inject reference solution (c). The test is not valid unless the resolution between the peaks corresponding to 2-methyl-5-nitroimidazole and ornidazole is at least 1.5.

Inject the test solution, reference solutions (a) and (b). In the chromatogram obtained with the test solution, the area of any peak corresponding to 2-methyl-5-nitroimidazole is not more than 0.2 times the area of the peak obtained with reference solution (a) (0.2 per cent) and the sum of areas of all the secondary peaks is not more than the area of the peak in the chromatogram obtained with reference solution (b) (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 0.5 g.

Assay. Weigh accurately about 0.15 g, dissolve in 50 ml of *glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent of 0.02196 g of $C_7H_{10}ClN_3O_3$.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Ornidazole Tablets

Ornidazole Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of ornidazole, $C_7H_{10}ClN_3O_3$.

Usual strength. 500 mg.

Identification

Extract a quantity of the powdered tablets containing 0.1 g of Ornidazole with 40 ml of *chloroform*, filter and evaporate the filtrate to dryness. The residue complies with the following test.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ornidazole RS* or with the reference spectrum of ornidazole.

B. Heat a quantity of the powdered tablets containing 0.1 g of Ornidazole with 10 mg of *zinc powder*, 1 ml of *water* and 0.25 ml *hydrochloric acid* for 5 minutes, cool in ice, add 0.5 ml of *sodium nitrite solution* and remove the excess of nitrite with *sulphuric acid*. Add 0.5 ml of *2-naphthol solution* and 2 ml of *5 M sodium hydroxide solution*. An orange-red colour is produced.

Tests

Dissolution (2.5.2).

Apparatus No. 1,

Medium. 900 ml of *0.1 M hydrochloric acid*,

Speed and time. 75 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter promptly, rejecting the first few ml of the filtrate and dilute a suitable volume of the filtrate with *0.1 M hydrochloric acid*. Measure the absorbance of the resulting solution at the maximum at about 277 nm (2.4.7). Calculate the content of ornidazole, $C_7H_{10}ClN_3O_3$ in the medium from the absorbance obtained from a solution of known concentration of *ornidazole RS*.

D. Not less than 80 per cent of the stated amount of $C_7H_{10}ClN_3O_3$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing 25 mg of ornidazole in 25.0 ml of the mobile phase.

Reference solution (a). A 0.001 per cent w/v solution of *2-methyl-5-nitroimidazole RS* in the mobile phase.

Reference solution (b). A 0.001 per cent w/v solution of *ornidazole RS* in the mobile phase.

Reference solution (c). Dilute 20.0 ml of reference solution (a) and 1.0 ml of reference solution (b) to 200.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 70 volumes of *0.01M potassium dihydrogen orthophosphate* and 30 volumes of *methanol*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 318 nm,
- injection volume. 20 µl.

Inject reference solution (c). The test is not valid unless the resolution between the peaks corresponding to 2-methyl-5-nitroimidazole and ornidazole is at least 2.0.

Inject the test solution, reference solution (a) and (b). In the chromatogram obtained with the test solution, the area of any peak corresponding to 2-methyl-5-nitroimidazole is not more than 0.2 times the area of the peak obtained with reference solution (a) (0.2 per cent) and the sum of areas of all the secondary peaks is not more than the area of the peak in the chromatogram obtained with the reference solution (b) (1.0 per cent).

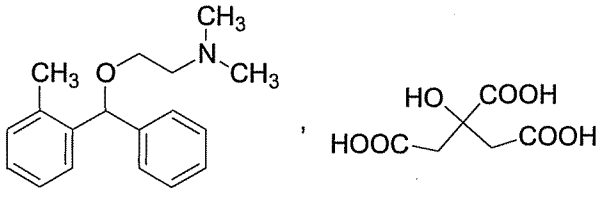
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing 0.2 g of Ornidazole, transfer to a sintered-glass crucible and extract with 10 ml of hot *acetone*. Repeat the extraction 6 times with hot *acetone*. Cool, add to the combined extracts 50 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, determining the end point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02196 g of $C_7H_{10}ClN_3O_3$.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Orphenadrine Citrate



$C_{18}H_{23}NO,C_6H_8O_7$ Mol. Wt. 461.5

Orphenadrine Citrate is (*RS*)-dimethyl[2-(2-methylbenzhydryloxy)ethyl]amine dihydrogen citrate.

Orphenadrine Citrate contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{18}H_{23}NO$, $C_6H_8O_7$, calculated on the dried basis.

Category. Skeletal muscle relaxant.

Dose. By intramuscular or by slow intravenous injection (over 5 minutes), 60 mg repeated after 12 hours if necessary.

Description. A white or almost white, crystalline powder; odourless or almost odourless.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B, C and D may be omitted if tests A and E are carried out.

A. Determine by infrared absorption spectrophotometry,(2.4.6). Compare the spectrum with that obtained with *orphenadrine citrate RS.*

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.06 per cent w/v solution in *ethanol (95 per cent)* shows absorption maxima at 258 nm, 264 nm and 271 nm; absorbances at the maxima are about 0.68, 0.72 and 0.47 respectively.

C. Dissolve 50 mg in 10 ml of *ethanol (50 per cent),* add 10 ml of *picric acid solution* and allow to stand. The precipitate after recrystallisation from *ethanol (95 per cent),* melts at about 89° or at about 107°(2.4.21).

D. Dissolve 5 mg in 2 ml of *sulphuric acid*; an orange-red colour is produced.

E. To 1 g add 10 ml *water* and 2 ml of *5 M sodium hydroxide,* shake with two quantities, each of 10 ml, of *chloroform* and discard the chloroform. Heat the aqueous solution to boiling with an excess of *mercuric sulphate solution,* filter if necessary and boil the resulting solution with 0.2 ml of *dilute potassium permanganate solution;* the solution is decolorised and a white precipitate is produced.

Tests

Quaternary ammonium salt. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel* G.

Mobile phase. A mixture of 50 volumes of *2-propanol,* 30 volumes of *butyl acetate.* 15 volumes of *water* and 5 volumes of *strong ammonia solution.*

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml *methanol.*

Reference solution. A 0.005 per cent *w/v solution* of *ethyldimethyl [2-(2-methylbenzhydryloxy)ethyl]ammonium chloride RS.*

Apply to the plate 5 µl of each solution. After development, dry the plate in air and spray with *dilute potossium*

iodobismuthate solution. Any spot corresponding to ethyldimethyl [2-(2-methylbenzhydryloxy) ethyl] ammonium chloride in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Secondary amine. Determine by thin-layer chromatography (2.4.17) coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 96 volumes of *1-butanol* and 4 volumes of *strong ammonia solution.*

Test solution. Dissolve 0.4 g of the substance under examination in 10 ml *methanol.*

Reference solution. A 0.02 per cent *w/v* solution of *methyl [2-(2-methylbenzhydryloxy)ethyl]amine hydrochloride RS.*

Apply to the plate 10 µl of each solution. After development, dry in air and examine in ultra-violet light at 254 nm. Spray the plate with *dilute potassium iodobismuthate solution* and examine again. By each method of visualisation any spot corresponding to methyl [2-(2-methylbenzhydryloxy) ethyl]amine hydrochloride in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm). Use 2 ml of lead standard solution (*10 ppm Pb*) to prepare the standard.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.3.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Weigh accurately about 1.0 g, dissolve in 30 ml of *anhydrous glacial acetic acid.* Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04615 g of $C_{18}H_{23}NO, C_6H_8O_7$.

Storage. Store protected from light.

Orphenadrine Hydrochloride

$C_{18}H_{23}NO,HCl$ Mol. Wt.305.8

Orphenadrine Hydrochloride is (*RS*)-dimethyl [2-(2methylbenzhydryloxy) ethyl]amine hydrochloride.

Orphenadrine Hydrochloride contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{18}H_{23}NO,HCl$. calculated on the dried basis.

Category. Antiparkinsonian.

Dose. 150 mg daily, in divided doses, gradually increased; maximum 400 mg daily.

Description. A white or almost white, crystalline powder; odourless or almost odourless.

Identification

Tests A and F may be omitted if tests B, C, D and E are carried out. Tests B, C and D may be omitted if tests A, E and F are carried out.

A. Determine by infrared absorption spectrophotometry,(2.4.6). Compare the spectrum with that obtained with *orphenadrine hydrochloride RS.*

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.06 per cent *w/v* solution in *ethanol (95 per cent)* shows three absorption maxima at about 258 nm,264 nm and 271 nm; absorbances at the maxima, about 1.07, 1.13 and 0.73 respectively.

C. Dissolve about 5 mg in 2 ml of *sulphuric acid;* an orange-red colour is produced.

D. Dissolve about 50 mg in 10 ml of *ethanol (95per cent),* add 10 ml of *picric acid solution* and allow to stand. The precipitate, after recrystallisation from *ethanol* (95 per cent) melts at about 89° or at about 107°(2.4.21).

Tests

Quaternary ammonium salt. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel* G.

Mobile phase. A mixture of 50 volumes of *2-propanol,* 30 volumes of *butyl acetate*, 15 volumes of *water* and 5 volumes of *strong ammonia solution.*

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of *methanol.*

Reference solution. A 0.005 per cent *w/v solution* of *ethyldimethyl [2-(2-methylbenzhydryloxy) ethyl] ammonium chloride RS.*

Apply to the plate 5 µl of each solution. After development, dry the plate in air and spray with *dilute potassium iodobismuthate solution.* Any spot corresponding to ethyldimethyl [2-(2-methylbenzhydryloxy) ethyl] ammonium chloride in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Secondary amine. Determine by thin-layer chromatography (2.4.17) coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 96 volumes of *l-butanol* and 4 volumes of *strong ammonia solution.*

Test solution. Dissolve 0.4 g of the substance under examination in 10 ml of *methanol.*

Reference solution. A 0.02 per cent *w/v* solution of *methyl [2-(2-methylbenzhydryloxy)ethyl]amine hydrochloride RS.*

Apply to the plate 10 µl of each solution. After development, dry in air and examine in ultra-violet light at 254 nm. Spray the plate with *dilute potassium iodobismuthate solution* and examine again. By each method of visualisation any spot corresponding to methyl [2-(2-methylbenzhydryloxy) ethyl]amine hydrochloride in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm). Use 2 ml of lead standard solution (*10 ppm Pb*) to prepare the standard.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.3.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Weigh accurately about 1.0 g, dissolve in 20 ml of *anhydrous glacial acetic acid,* add 20 ml of *mercuric acetate solution* and titrate with *0.1 M perchloric acid* using *1-naphtholbenzein solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03058 g of $C_{18}H_{23}NO,HCl$.

Storage. Store protected from light.

Orphenadrine Tablets

Orphenadrine Hydrochloride Tablets

Orphenadrine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of orphenadrine hydrochloride, $C_{18}H_{23}NO,HCl$.

Usual strength. 50 mg.

Identification

Extract a quantity of the powdered tablets containing about 0.15 g of Orphenadrine Hydrochloride with *chloroform,* filter and evaporate the filtrate to dryness. The residue complies with the following tests.

A. Dissolve 5 mg in 2 ml of *sulphuric acid;* an orange-red colour is produced.

B. Dissolve 50 mg in 10 ml of *ethanol (50 per cent),* add 10 ml of *picric acid solution* and allow to stand. The precipitate after recrystallisation from *ethanol (95 per cent),* melts at about 89° or at about 107° (2.4.21).

C. A 5 per cent w/v solution gives reaction A of chlorides (2.3.1).

Tests

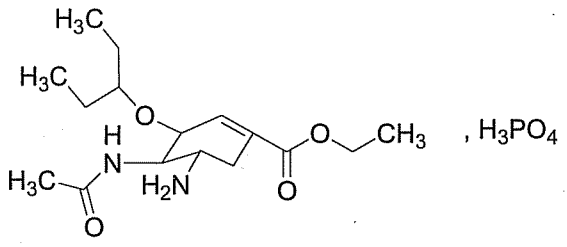
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 70 mg Orphenadrine Hydrochloride and dissolve as completely as possible in a mixture of 5 ml of *water* and 5 ml of *2 M hydrochloric acid.* Without delay extract with four quantities, each 15 ml, of *chloroform,* filter the combined extracts and evaporate to about 20 ml. Add 30 ml of *anhydrous glacial acetic* and 2 ml of *mercuric acetate solution* and titrate with *0.02 M perchloric acid* determining the end point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.02 M perchloric acid* is equivalent to 0.006117 g of $C_{18}H_{23}NO,HCl$.

Storage. Store protected from light and moisture.

Oseltamivir Phosphate



$C_{16}H_{28}N_2O_4,H_3PO_4$ Mol. Wt. 410.4

Oseltamivir Phosphate is phosphoric acid salt of ethyl (3*R*,4*R*,5*S*)-4-(acetylamino)-5-amino-3-(1-ethylpropoxy)-1-cyclohexene-1-carboxylate.

Oseltamivir Phosphate contain not less than 98.0 per cent and not more than 102.0 per cent of $C_{16}H_{28}N_2O_4.H_3PO_4$, calculated on the dried basis.

Category. Antiviral.

Description. A white or off-white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *oseltamivir phosphate RS.*

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). - 42.0° to - 48.0°, determined in a 1.0 per cent w/v solution in *methanol.*

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Dissolve 25 mg of the substance under examination in 25 ml of the mobile phase.

Reference solution (a). A 0.1 per cent w/v solution of *oseltamivir phosphate RS* in the mobile phase.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (such as YMC pack PRO C8),
- column temperature 50°,
- mobile phase: a mixture of 66 volumes of a buffer solution prepared by dissolving 6.8 g of *anhydrous monobasic potassium phosphate* in 1000 ml of *water* and adjusting the pH to 6.0 with *dilute sodium hydroxide,* 24.5 volumes of *methanol* and 23.5 volumes of *acetonitrile,*
- flow rate. 1 ml per minute,
- spectrophotometer set at 207 nm,
- injection volume. 20 µl.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution and reference solution (b). In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the peak in the chromatogram obtained with the reference solution (b) (0.5 per cent) and the sum of all the secondary peaks is not more than the area of the peak in the chromatogram obtained with the reference solution (b) (1.0 per cent).

Phosphoric acid. 23.4 to 24.4 per cent, calculated on a dried basis.

Weigh accurately about 0.2 g and dissolve in 40 ml of distilled *water*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.0049 g of phosphoric acid.

Heavy metals (2.3.13). 1 g complies with the limit test for heavy metals, Method A (20 ppm).

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 50.0 ml of the mobile phase. Dilute 10.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.02 per cent w/v solution of *oseltamivir phosphate RS* in the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as YMC pack PRO C8),
- column temperature. 50°,
- mobile phase: a mixture of 66 volumes of *buffer solution* prepared by dissolving 6.8 g of *anhydrous monobasic potassium phosphate* in 1000 ml of *water*, adjusting the pH to 6.0 with *dilute sodium hydroxide,* 24.5 volumes of *methanol* and 23.5 volumes of *acetonitrile,*
- flow rate. 1 ml per minute,
- spectrophotometer set at 207 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency in not less than 2000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{16}H_{28}N_2O_4,H_3PO_4$.

Storage. Store protected from light and moisture.

Oseltamivir Capsules

Oseltamivir Phosphate Capsules

Oseltamivir Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of oseltamivir, $C_{16}H_{28}N_2O_4$.

Usual strength. 75 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1,
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 50 rpm and 45 minutes

Withdraw a suitable volume of the medium and filter. Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate.

Reference solution. Dissolve 50 mg of *oseltamivir phosphate RS* in 20 ml of the mobile phase and dilute to 100 ml with the dissolution medium. Dilute 5 ml of the solution to 25 ml with the dissolution medium.

Use the chromatographic system described under Assay.

D. Not less than 80 per cent of the stated amount of $C_{16}H_{28}N_2O_4$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Weigh accurately a quantity of the mixed contents of 20 capsules containing about 50 mg of oseltamivir, disperse in 50 ml of mobile phase and filter.

Reference solution (a). A 0.1 per cent w/v solution of *oseltamivir phosphate RS* in the mobile phase.

Reference solution (b). Dilute 1 ml of reference solution to 100 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (such as YMC pack PRO C8),
- mobile phase: a mixture of 66 volumes of a buffer solution prepared by dissolving 6.8 g of *anhydrous monobasic potassium phosphate* in 1000 ml of *water*, adjusting the pH to 6.0 with *dilute sodium hydroxide*, 24.5 volumes of *methanol* and 23.5 volumes of *acetonitrile*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 207 nm,
- injection volume. 20 µl.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution and reference solution (b). In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with the reference solution (b) (1.0 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the peak in the chromatogram obtained with the reference solution (b) (2.0 per cent).

Other tests. Comply with the tests stated under Capsules.

Water (2.3.43). Not more than 5.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Weigh accurately a quantity of the mixed contents of 20 capsules containing about 200 mg of oseltamivir, disperse in 100.0 ml of the mobile phase and filter. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.02 per cent w/v solution of *oseltamivir phosphate RS* in the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 66 volumes of a buffer solution prepared by dissolving 6.8 g of *anhydrous monobasic potassium phosphate* in 1000 ml of *water* and adjusting the pH to 6.0 with *dilute sodium hydroxide*, 24.5 volumes of *methanol* and 23.5 volumes of *acetonitrile*,
- flow rate. 1.2 ml per minute,
- spectrophotometer set at 207 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency is not less than 2000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{16}H_{28}N_2O_4$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of oseltamivir.

Oseltamivir Oral Suspension

Oseltamivir Phosphate Oral Suspension

Oseltamivir Oral Suspension is a mixture consisting of Oseltamivir Phosphate with buffering agents and other excipients. It contains a suitable flavouring agent. It is filled in a sealed container.

The suspension is constituted by dispersing the contents of the sealed container in the specified volume of water just before issue.

Oseltamivir Oral Suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of oseltamivir $C_{16}H_{28}N_2O_4$.

The contents of the sealed container comply with the following requirement.

Usual strength. 15 mg per ml.

Water (2.3.43). Not more than 2.5 per cent, determined on 1.0 g.

The constituted suspension complies with the requirements stated under Oral liquids and with the following requirements.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (b).

B. To 2 ml of the reconstituted suspension, add 2 ml of *dilute nitric acid* and 4 ml of a 10 per cent w/v solution of *ammonium*

molybdate and warm the solution. A bright yellow precipitate is formed.

Tests

pH (2.4.24). 3.0 to 5.0.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Weigh accurately a quantity of the suspension containing 25 mg of oseltamivir, dissolve in 25 ml of the mobile phase and filter.

Reference solution (a). A 0.1 per cent w/v solution of *oseltamivir phosphate RS* in the mobile phase.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature 35°,
- mobile phase: 70 volumes of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen phosphate* in 1000 ml of *water* and adjusting the pH to 6.0 with *dilute sodium hydroxide,* 15 volumes of *methanol* and 15 volumes of *acetonitrile,*
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 207 nm,
- injection volume. 20 µl.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution and reference solution (b). In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with the reference solution (b) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 3 times the area of the peak in the chromatogram obtained with the reference solution (b) (3.0 per cent).

Other tests. Complies with the tests stated under Oral liquids.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Weigh accurately a quantity of the suspension containing 60 mg of oseltamivir, dissolve in 250.0 ml of the mobile phase and filter. Dilute 10.0 ml of the solution to 25.0 ml with the mobile phase and filter.

Reference solution. A 0.0125 per cent w/v solution of *oseltamivir phosphate RS* in the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen phosphate* in 1000 ml of *water* and adjusting the pH to 6.0 with *dilute sodium hydroxide,* 24.5 volumes of *methanol* and 23.5 volumes of *acetonitrile,*
- flow rate. 1.2 ml per minute,
- spectrophotometer set at 207 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency in not less than 2000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

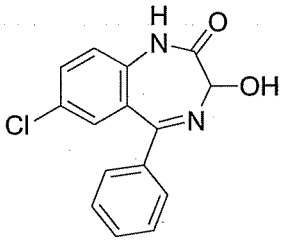
Inject the test solution and the reference solution.

Calculate the content of $C_{16}H_{28}N_2O_4$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states (1) the quantity of active ingredient in terms of the equivalent amount of oseltamivir; (b) the temperature of storage and the period during which the constituted suspension may be expected to be satisfactory for use.

Oxazepam



$C_{15}H_{11}ClN_2O_2$ Mol. Wt. 286.7

Oxazepam is 7-chloro-3-hydroxy-5-phenyl-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one.

Oxazepam contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{15}H_{11}ClN_2O_2$, calculated on the dried basis.

Category. Anxiolytic.

Dose. 15 to 30 mg, 2 to 3 times daily.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and D may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *oxazepam RS.*

B. Prepare the solutions immediately before use, protected from light.

Dissolve about 20 mg in sufficient *ethanol (95 per cent)* to produce 100 ml. Dilute 10 ml of the solution to 50 ml with *ethanol (95 per cent)* (solution A). Dilute 10 ml of solution A to 100 ml with *ethanol (95 per cent)* (solution B).

When examined in the range 230 nm to 360 nm (2.4.7), solution A shows an absorption maximum at about 316 nm. When examined in the range 220 nm to 250 nm, solution B shows an absorption maximum at about 229 nm; absorbance at about 229 nm, 1.220 to 1.300.

C. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (b).

D. Dissolve about 20 mg in a mixture of 5 ml of *hydrochloric acid* and 10 ml of *water.* Heat to boiling for 5 minutes and cool. Add 2 ml of a 0.1 per cent *w/v* solution of *sodium nitrite* and allow to stand for 1 minute. Add 1 ml of a 0.5 per cent w/v solution of *sulphamic acid,* mix and allow to stand for 1 minute. Add 1 ml of 0.1 per cent w/v solution of a *N- (1-naphthyl) ethylenediamine dihydrochloride;* a red colour is produced.

Tests

Related substances. *Carry out the test protected from light.*

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Wash the plate with methanol before use.

Mobile phase. A mixture of 100 volumes of *dichloromethane* and 10 volumes of *methanol.*

Test solution (a). Dissolve 50 mg of the substance under examination in sufficient *acetone* to produce 10 ml.

Test solution (b). Dilute 2 ml of test solution (a) to 10 ml with *acetone.*

Reference solution (a). Dissolve 10 mg of *oxazepam RS* in sufficient *acetone* to produce 10 ml.

Reference solution (b). Dissolve 10 mg each of *oxazepam RS and bromazepam RS* in sufficient *acetone* to produce 10 ml.

Reference solution (c). Dilute 1 ml of reference solution (a) to 100 ml with *acetone.*

Reference solution (d). Dilute 5 ml of solution (d) to 10 ml with *acetone.*

Apply to the plate 20 µl of each solution. Allow the mobile phase to rise 17 cm in the same direction as the washing with methanol. Dry in air and examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (c) and at most one such spot is more intense than the spot in the chromatogram obtained with reference solution (d). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° at a pressure not exceeding 0.7 kPa.

Assay. Weigh accurately about 0.25 g and dissolve in a mixture of 10 ml of *anhydrous glacial acetic acid* and 90 ml of *acetic anhydride* and titrate with *0.1 M perchloric acid* determining the end point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02867 g of $C_{15}H_{11}ClN_2O_2$.

Storage. Store protected from light and moisture.

Oxazepam Tablets

Oxazepam Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of oxazepam, $C_{15}H_{11}ClN_2O_2$.

Usual strengths. 10 mg; 15 mg; 30 mg.

Identification

A. Extract a quantity of the powdered tablets containing 20 mg of Oxazepam with 25 ml of *chloroform,* filter, evaporate to dryness and dry the residue at 60° at a pressure not exceeding 0.7 kPa.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *oxazepam RS or* with the *reference spectrum* of oxazepam.

B. When examined in the range 210 nm to 360 nm (2.4.7), the solution obtained in the Assay shows absorption maxima at about 230 nm and 316 nm.

Tests

Related substances. *Carry out the test protected from light.*

Determine by thin-layer chromatography (2.4.17) coating the plate with *silica gel GF 254.*

Wash the plate with *methanol* before use.

Mobile phase. A mixture of 100 volumes of *dichloromethane* and 10 volumes of *methanol.*

Test solution. Shake a quantity of powdered tablets containing 30 mg of Oxazepam with 6 ml of *acetone* and centrifuge.

Reference solution (a). Dilute 1 volume of the test solution to 100 volumes with *acetone.*

Reference solution (b). Dilute 1 volume of the test solution to 500 volumes with *acetone.*

Reference solution (c). A solution containing 0.1 per cent w/v each of *oxazepam RS* and *bromazepam RS.*

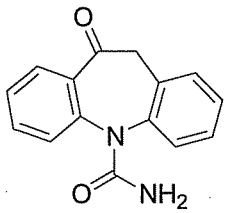
Apply to the plate 20 µl of each of the solutions. Allow the mobile phase to rise 17 cm in the same direction as in the washing with methanol. Dry in air and examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) (1 per cent) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 25 mg of Oxazepam and shake with 150 ml of *ethanol (95 per cent)* for 30 minutes. Add sufficient *ethanol (95 per cent)* to produce 250.0 ml and centrifuge. Dilute 5.0 ml of the supernatant liquid to 100.0 ml with the same solvent and measure the absorbance of the resulting solution at the maximum at about 230 nm (2.4.7). Calculate the content of $C_{15}H_{11}ClN_2O_2$ taking 1250 as the specific absorbance at 230 nm.

Storage. Store protected from light at a temperature not exceeding 30°.

Oxcarbazepine



$C_{15}H_{12}N_2O_2$, Mol. Wt. 252.3

Oxcarbazepine is 10,11-dihydro-10-oxo-5*H*-dibenz[*b,f*]azepine-5-carboxamide.

Oxcarbazepine contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{15}H_{12}N_2O_2$, calculated on the dried basis.

Category. Non-opioid analgesics.

Dose. 300 mg twice a day.

Description. An off-white to yellow crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *oxcarbazepine RS* or with the reference spectrum of oxcarbazepine.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Note — Use freshly prepared solutions.

Test solution. Dissolve 50 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). A 0.05 per cent w/v solution of *oxcarbazepine RS* in the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (such as Inertsil C18),
- column temperature 50°,
- mobile phase: a mixture of 22 volumes of *methanol*, 16 volumes of *acetonitrile* and 62 volumes of a buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, adding 2 ml of *triethylamine* and adjusting the pH to 6.0,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume. 10 µl.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution and reference solution (b). Run the chromatograms for about 60 minutes. The relative retention times with reference to oxcarbazepine are 1.7 for dibenz[b,f]azepine-5-carboxylic acid amide (oxcarbazepine impurity A), 7.9 for 10-methoxy-5H-dibenz[b,f]azepine (oxcarbazepine impurity B), and 2.5 for 10-methoxy-5H-dibenz[b,f]azepine-5-carboxylic acid amide (oxcarbazepine impurity C).

Calculate the contents of the impurities in the test solution using the correction factors, 0.68 for oxcarbazepine impurity A, 0.76 for oxcarbazepine impurity B and 0.80 for oxcarbazepine impurity C. Not more than 1.0 per cent of oxcarbazepine impurity A and not more than 0.1 per cent each of oxcarbazepine impurity B and oxcarbazepine impurity C and not more than 0.1 per cent of any other impurity is found. The sum of all the impurities is not more than 1.5 per cent.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14) as described under related substances using the following solution.

Test solution. Dissolve 10 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *oxcarbazepine RS* in the mobile phase.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency is not less than 2000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{15}H_{12}N_2O_2$.

Storage. Store protected from moisture.

Oxcarbazepine Tablets

Oxcarbazepine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of oxcarbazepine, $C_{15}H_{12}N_2O_2$.

Usual strengths. 150 mg; 300 mg; 450 mg; 600 mg.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution (b) corresponds to the peak in the chromatogram obtained with reference solution (b).

B. Extract a quantity of the powdered tablets containing about 50 mg of oxcarbazepine with 100 ml with *methanol* and filter. Diluted 2.0 ml of this solution to 100.0 ml with *methanol*. When examined in the range 200 nm to 350 nm (2.4.7), the solution shows an absorption maximum at about 254 nm.

Tests

Dissolution (2.5.2).

Apparatus No. 1

Medium. 900 ml of 0.75 per cent w/v solution of *sodium lauryl sulphate* in *water*,

Speed and time. 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the medium if necessary, at the maximum at about 305 nm (2.4.7). Calculate the content of $C_{15}H_{12}N_2O_2$ in the medium from the absorbance obtained from a solution of known concentration of *oxcarbazepine RS* prepared by dissolving in minimum volume of *methanol* and then diluting with the dissolution medium.

D. Not less than 75 per cent of the stated amount of $C_{15}H_{12}N_2O_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Note — Use freshly prepared solutions.

Test solution (a). Weigh accurately a quantity of the powdered tablets containing 50 mg of Oxcarbazepine add 15 ml *methanol*, mix with the aid of ultrasound for 15 minutes and dilute to 100.0 ml with *methanol*. Mix and centrifuge.

Test solution (b). Dilute 5.0 ml of test solution (a) to 25.0 ml with the mobile phase.

Reference solution (a). Dissolve 25.0 mg of *oxcarbazepine RS* in *methanol* with the aid of ultrasound and dilute to 50.0 ml with *methanol*.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 25.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil BDS C18),
- column temperature 50°,
- mobile phase: a mixture of 66 volumes of *0.05M potassium dihydrogen phosphate*, 14 volumes of *acetonitrile* and 20 volumes of *methanol*, add 0.1 ml of *triethylamine* and adjust the pH to 6.0 with *orthophosphoric acid*,
- flow rate. 2 ml per minute,
- spectrophotometer set at 215 nm,
- injection volume. 20 µl.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject test solution (a) and reference solution (c). Run the chromatograms for three times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with reference solution (c) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the peak in the chromatogram obtained with reference solution (c) (2.0 per cent).

Other tests. Comply with the tests stated under Tablets.

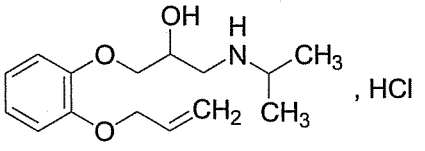
Assay. Determine by liquid chromatography (2.4.14) as described under Related substances.

Inject test solution (b) and reference solution (b).

Calculate the content of $C_{15}H_{12}N_2O_2$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Oxprenolol Hydrochloride



$C_{15}H_{23}NO_3,HCl$ Mol. Wt. 301.8

Oxprenolol Hydrochloride is (*RS*)-1-(2-allyloxyphenoxy)-3-isopropylaminopropan-2-ol hydrochloride.

Oxprenolol Hydrochloride contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{15}H_{23}NO_3,HCl$, calculated on the dried basis.

Category. Beta-adrenoceptor antagonist (antihypertensive; antianginal; antiarrhythmic).

Dose. As antihypertensive, initially 80 mg twice daily, increased as required at weekly intervals; maximum 480 mg daily. As antianginal, 40 to 160 mg thrice daily. As antiarrhythmic, initially 20 to 40 mg thrice daily, increased as necessary.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Test B may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *oxprenolol RS* or with the reference spectrum of oxprenolol.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (c).

C. Gives reaction A of chlorides (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and not more intensely coloured than reference solution GYS6 (2.4.1).

pH (2.4.24). 4.5 to 6.0, determined in a freshly prepared 10.0 per cent w/v solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G.*

Mobile phase. A mixture of 88 volumes of *chloroform*, 12 volumes of *methanol* and 2 volumes of *strong ammonia solution.*

Test solution (a). Dissolve 0.5 g of the substance under examination in 10 ml of a mixture of 90 volumes of *chloroform* and 10 volumes of *methanol.*

Test solution (b). Dissolve 0.5 g of the substance under examination in 100 ml of a mixture of 90 volumes of *chloroform* and 10 volumes of *methanol.*

Reference solution (a). A 0.02 per cent w/v solution of the substance under examination in a mixture of 90 volumes of *chloroform* and 10 volumes of *methanol.*

Reference solution (b). A 0.01 per cent w/v solution of the substance under examination in a mixture of 90 volumes of *chloroform* and 10 volumes of *methanol.*

Reference solution (c). A 0.5 per cent w/v solution of *oxprenolol hydrochloride RS* in a mixture of 90 volumes of *chloroform* and 10 volumes of *methanol.*

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 13 cm. Dry the plate in warm air for 10 minutes, allow to cool, spray with *anisaldehyde solution*, heat at 105° for 10 minutes and examine in daylight. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 60° over *phosphorus pentoxide* at a pressure of 1.5 to 2.5 kPa for 6 hours.

Assay. Weigh accurately about 0.25 g, dissolve in 60 ml of *anhydrous glacial acetic acid*, add 5 ml of *mercuric acetate solution.* Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25).Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03018 g of $C_{15}H_{23}NO_3,HCl$.

Storage. Store protected from light and moisture.

Oxprenolol Tablets

Oxprenolol Hydrochloride Tablets

Oxprenolol Hydrochloride Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of oxprenolol hydrochloride, $C_{15}H_{23}NO_3,HCl$. The tablets are coated.

Usual strengths. 40 mg; 80 mg.

Identification

A.To a quantity of the powdered tablets containing 50 mg of Oxprenolol Hydrochloride add 10 ml of *water* and 2 ml of *dilute sodium hydroxide solution*, extract with 10 ml of *chloroform* and reserve the aqueous layer for test C. Dry the chloroform extract over *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *oxprenolol hydrochloride RS* or with the reference spectrum of oxprenolol hydrochloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), the solution obtained in the Assay shows an absorption maximum only at about 273 nm.

C. The aqueous layer obtained in test A gives reaction A of chlorides (2.3.1).

D. The residue obtained in test A melts at about 76° (2.4.21).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 88 volumes of *chloroform*, 12 volumes of *methanol* and 2 volumes of *strong ammonia solution*.

Test solution. Extract a quantity of the powdered tablets containing 0.25 g of Oxprenolol Hydrochloride with 5 ml of *water*, centrifuge and use the supernatant liquid.

Reference solution. Dilute 1 volume of the test solution to 200 volumes with *water*.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 13 cm. Dry the plate in warm air for 10 minutes, allow to cool, spray with *anisaldehyde solution*, heat at 105° for 10 minutes and examine in daylight. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 20 mg of Oxprenolol Hydrochloride, add 25 ml of *0.1 M hydrochloric acid* and sufficient *water* to produce 250.0 ml. Mix with the aid of ultrasound for 5 minutes, shake for 15 minutes and filter. Measure the absorbance of the resulting solution at the maximum at about 273 nm (2.4.7). Calculate the content of $C_{15}H_{23}NO_3,HCl$ taking 74.5 as the specific absorbance at 273 nm.

Storage. Store protected from moisture.

Oxygen

O_2 Mol. Wt. 32.0

Oxygen contains not less than 99.0 per cent v/v of O_2.

This monograph applies to oxygen for medicinal use only.

Description. A colourless gas; odourless.

Identification

A. A glowing splinter of wood bursts into flame on contact with the gas.

B. Shake with *alkaline pyrogallol solution*; the gas under examination is absorbed and the solution becoming dark brown.

C. When tested as described under Assay, not more than 1.0 ml of gas remains.

Tests

Carbon dioxide. Not more than 300 ppm v/v, determined by using a carbon dioxide detector tube (2.1.1).

Carbon monoxide. Not more than 5 ppm v/v, determined by using a carbon monoxide detector tube (2.1.1).

Water vapour. Not more than 67 ppm v/v, determined by using a water vapour detector tube (2.1.1).

Assay (2.3.33). Use 100 ml of the gas under examination and place spirals of freshly cleaned copper wire and 125 ml of *ammonia buffer pH 10.9* in the pipette. The volume of the residual gas in the burette is not more than 1.0 ml.

Storage. Store under pressure in metal cylinders of the type conforming to the appropriate safety regulations. Valves and taps should not be lubricated with oil or grease.

Labelling. The shoulder of the metal cylinder should be painted white and the remainder should be painted black. The cylinder should carry a label stating "Oxygen". In addition, "Oxygen" or the symbol "O_2" should be stencilled in paint on the shoulder of the cylinder.

Oxygen 93 Per Cent

Oxygen 93 per Cent contains not less than 90.0 per cent and not more than 96.0 per cent, v/v of O_2, the remainder consisting mostly of argon and nitrogen. It is produced from air by the molecular sieve process.

Description. A colourless gas; odourless.

Identification

A. A glowing splinter of wood bursts into flame on contact with the gas.

B. Shake with alkaline pyrogallol solution; the gas under examination is absorbed and the solution becomes dark brown.

C. When tested as described under Assay, not more than 10.0 ml and not less than 4.0 ml of gas remain.

Tests

Carbon dioxide. Not more than 300 ppm v/v, determined by using a *carbon dioxide detector tube* (2.1.1).

Carbon monoxide. Not more than 5 ppm v/v, determined by using a *carbon monoxide detector tube* (2.1.1).

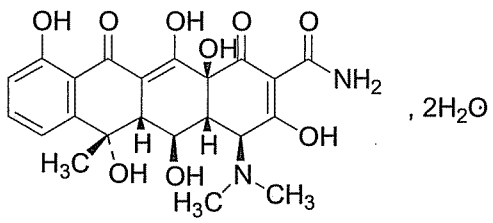
Assay (2.3.33). Use 100 ml of the gas under examination and place spirals of freshly cleaned copper wire and 125 ml of *ammonia buffer pH 10.9* in the pipette. The volume of the residual gas in the burette is not more than 10.0 ml and not less than 4.0 ml.

Storage. Store in cylinders or in a low pressure collecting tank. Containers used for Oxygen 93 Per Cent must not be treated with any toxic, sleep-inducing or narcosis-producing compounds and must not be treated with any compound that will be irritating to the respiratory tract when the Oxygen 93 Per Cent is used.

Labelling. Label each outlet "Oxygen 93 Per Cent", when it is piped directly from the collecting tank to the point of use. If it is stored in cylinders, reduce the pressure by means of a regulator. Measure the gases with a gas volume meter downstream from the detector tube in order to minimise contamination or change of the specimens. The shoulder of the cylinder should be painted white and the remainder should be painted black. The cylinder should carry a label stating "Oxygen 93 Per Cent" and "For medicinal use".

Oxytetracycline Dihydrate

Oxytetracycline



$C_{22}H_{24}N_2O_9,2H_2O$ Mol. Wt. 496.5

Oxytetracycline is (4*S*,4a*R*,5*S*,5a*R*,6*S*,12a*S*)-4-dimethyl amino-1,4,4a,5,5a,6,11,12a-octahydro-3,5,6,10,12,12a-hexahydroxy-6-methyl-1,11-dioxonaphthacene-2-carboxamide dihydrate, a substance produced by the growth of certain strains of *Streptomyces rimosus* or obtained by any other means. It contains a variable quantity of water.

Oxytetracycline has a potency not less than 900 µg of $C_{22}H_{24}N_2O_9$, per mg, calculated on the anhydrous basis.

Category. Antibacterial.

Dose. Orally, 250 to 500 mg every 6 hours; by intramuscular injection, 1 to 2 g daily.

Description. A tan yellow or light yellow (with or without a greenish tinge), crystalline powder; odourless.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with the substance prepared by mixing 25 g of *silica gel G* with 50 ml of a mixture of 2.5 ml of *glycerin* and 47.5 ml of *0.1 M disodium edetate* previously adjusted to pH 7.0 with *dilute ammonia solution*. After spreading the plate, allow it to stand at room temperature till it is dry (70 to 90 minutes).

Mobile phase. The lower layer formed after shaking 200 ml of a mixture of 2 volumes of *ethyl acetate*, 2 volumes of *chloroform* and 1 volume of *acetone* with 25 ml of *0.1 M disodium edetate* previously adjusted to pH 7.0 with *dilute ammonia solution*.

Test solution. Dissolve 0.05 g of the substance under examination in 100 ml of *methanol*.

Reference solution (a). A 0.05 per cent w/v solution of *oxytetracycline RS* in *methanol*.

Reference solution (b). A solution containing 0.05 per cent w/v each of *demethylchlortetracycline hydrochloride RS, oxytetracycline hydrochloride RS* and *tetracycline hydrochloride RS* in *methanol*.

Apply to the plate 1 µl of each solution, freshly prepared. After development, dry the plate in air, expose to the vapours of ammonia and examine in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.

B. To about 0.5 mg add 2 ml of *sulphuric acid*; a red colour is produced. Add the solution to 1 ml of *water*; the colour changes to yellow.

C. Dissolve about 2 mg in 5 ml of a 1 per cent w/v solution of *sodium carbonate* and add 2 ml of *diazotised sulphanilic acid solution*; an orange-red to brownish-red colour is produced.

Tests

pH (2.4.24). 4.5 to 7.5, determined in a 1.0 per cent w/v suspension in freshly boiled and cooled *water*.

Specific optical rotation (2.4.22). –203° to –216°, determined at 20° in a 1.0 per cent w/v solution in *0.1 M hydrochloric acid*, after allowing the solution to stand protected from light for 30 minutes before measurement.

Light absorption. Absorbance of a 0.002 per cent w/v solution in *buffer solution pH 2.0* at the maximum at about 353 nm, 0.58 to 0.62 (2.4.7).

Light-absorbing impurities. A. Dissolve 20 mg in sufficient of a mixture of 1 volume of *1 M hydrochloric acid* and 99 volumes of *methanol* to produce 10 ml. Absorbance of the resulting solution at about 430 nm, when measured within 1 hour of preparing the solution, not more than 0.25, calculated on the anhydrous basis (2.4.7).

B. Dissolve 0.1 g in sufficient of a mixture of 1 volume of *1 M hydrochloric acid* and 99 volumes of *methanol* to produce 10 ml. Absorbance of the resulting solution at about 490 nm, when measured within 1 hour of preparing the solution, not more than 0.20, calculated on the anhydrous basis (2.4.7).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in 25 ml of *0.01 M hydrochloric acid*.

Reference solution (a). Dissolve 20 mg of *oxytetracycline RS* in 25 ml of *0.01 M hydrochloric acid*.

Reference solution (b). Dissolve 20 mg of *4-epioxytetracycline RS* in 25 ml of *0.01 M hydrochloric acid*.

Reference solution (c). Dissolve 20 mg of *tetracycline hydrochloride RS* in 25 ml of *0.01 M hydrochloric acid*.

Reference solution (d). Dilute a mixture of 1.5 ml of reference solution (a), 1.0 ml of reference solution (b) and 3.0 ml of reference solution (c) to 25 ml with *0.01 M hydrochloric acid*.

Reference solution (e). Dilute a mixture of 1.0 ml of reference solution (b) and 4.0 ml of reference solution (c) to 200 ml with *0.01 M hydrochloric acid*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with styrene- divinylbenzene co-polymer (8 to 10 µm),
- column temperature. 60°,
- mobile phase: add 60 g of *2-methyl-2-propanol* to a volumetric flask with the aid of 200 ml of *water*, add 60 ml of *0.33 M phosphate buffer pH 7.5*, 50 ml of a 1.0 per cent w/v solution of *tetrabutylammonium hydrogen sulphate* previously adjusted to pH 7.5 with *2 M sodium hydroxide* and 10 ml of a 0.04 per cent w/v solution of *disodium edetate* previously adjusted to pH 7.5 with *2 M sodium hydroxide* and dilute to 1000.0 ml with *water*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Adjust the sensitivity so that the heights of the peaks in the chromatogram obtained with reference solution (d) are at least 50 per cent of the full-scale deflection of the recorder.

The test is not valid unless (a) the resolution between the first peak (4-epioxytetracycline) and the second peak (oxytetracycline) is at least 4.0 (b) the resolution between the second peak and the third peak (tetracycline) is at least 5.0 (the content of *2-methyl-2-propanol* in the mobile phase may be adjusted if necessary) and (c) the symmetry factor for the second peak is at most 1.25.

Inject reference solution (a) six times. The test is not valid unless the relative standard deviation of the area of the peak due to oxytetracycline is not greater than 1.0 per cent.

Inject the test solution and reference solution (e). In the chromatogram obtained with the test solution the area of any peak corresponding to 4-epioxytetracycline or tetracycline is not greater than the area of the corresponding peak in the chromatogram obtained with reference solution (e). In the chromatogram obtained with the test solution the area of any peak appearing on the tail of the principal peak is not greater than 4.0 times that of the peak due to 4-epioxytetracycline in the chromatogram obtained with reference solution (e).

Heavy metals (2.3.13). 0.4 g complies with limit the test for heavy metals, Method B (50 ppm).

Sulphated ash (2.3.18). Not more than 0.5 per cent.

Water (2.3.43). 4.0 to 9.0 per cent, determined on 0.5 g.

Assay. Determine by the microbiological assay of antibiotics, Method A or B (2.2.10), and express the results in µg of oxytetracycline, $C_{22}H_{24}N_2O_9$, per mg.

Oxytetracycline intended for use in the manufacture of parenteral preparations without a further procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.4 Endotoxin Unit per mg of Oxytetracycline.

Oxytetracycline intended for use in the manufacture of parenteral preparations without a further sterilisation procedure complies with the following additional requirement.

Sterility. Complies with the test for sterility (2.2.11).

Storage. Store protected from light and moisture. If it is intended for use in the manufacture of parenteral preparations, the container should be sterile and sealed so as to exclude micro-organisms.

Labelling. The label states whether or not the contents are intended for use in the manufacture of parenteral preparations.

Oxytetracycline Injection

Oxytetracycline Injection is a sterile solution of oxytetracycline with or without one or more suitable buffering agents, anaesthetics, preservatives, antioxidants, complexing agents and solvents.

Oxytetracycline Injection contains not less than 90.0 per cent and not more than 120.0 per cent of the stated amount of anhydrous oxytetracycline, $C_{22}H_{24}N_2O_9$.

Usual strengths. 50 mg per ml; 125 mg per ml.

Description. A clear, yellow to tan yellow solution. It may have a greenish tinge.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with the substance prepared by mixing 25 g of *silica gel G* with 50 ml of a mixture of 2.5 ml of *glycerin* and 47.5 ml of *0.1 M disodium edetate* previously adjusted to pH 7.0 with *dilute ammonia solution*. After spreading the plate, allow it to stand at room temperature till it is dry (70 to 90 minutes).

Mobile phase. The lower layer formed after shaking 200 ml of a mixture of 2 volumes of *ethyl acetate*, 2 volumes of *chloroform* and 1 volume of *acetone* with 25 ml of *0.1 M disodium edetate* previously adjusted to pH 7.0 with *dilute ammonia solution*.

Test solution. Shake a quantity containing 10 mg of anhydrous oxytetracycline with 20 ml of *methanol*, centrifuge if necessary and use the clear supernatant liquid.

Reference solution (a). A 0.05 per cent w/v solution of *oxytetracycline hydrochloride RS* in *methanol*.

Reference solution (b). A solution containing 0.05 per cent w/v each of *demethylchlortetracycline hydrochloride RS, oxytetracycline hydrochloride RS* and *tetracycline hydrochloride RS* in *methanol*.

Apply to the plate 1 µl of each solution, freshly prepared. After development, dry the plate in air, expose to the vapours of ammonia and examine in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.

B. Add 0.1 ml to 2 ml of *sulphuric acid*; a red colour is produced. Add the solution to 1 ml of *water*; the colour changes to yellow.

Tests

pH (2.4.24). 8.0 to 9.0.

Bacterial endotoxins (2.2.3). Not more than 0.4 Endotoxin Unit per mg of Oxytetracycline.

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by the microbiological assay of antibiotics, Method A or B (2.2.10), and express the result in mg of oxytetracycline, $C_{22}H_{24}N_2O_9$, per ml.

Storage. Store protected from light.

Labelling. The label states (1) the strength in mg of anhydrous oxytetracycline per ml; (2) that the contents are to be used for intramuscular use only; (3) the names of any preservatives used.

Oxytetracycline Hydrochloride

$C_{22}H_{24}N_2O_9,HCl$ Mol. Wt. 496.9

Oxytetracycline Hydrochloride is (4*S*,4a*R*,5*S*,5a*R*,6*S*, 12a*S*)-4-dimethylamino-1,4,4a,5,5a,6,11,12a-octahydro-3,5,6,10,12,12a-hexahydroxy-6-methyl-1,11-dioxonaphthacene-2-carboxamide hydrochloride, a substance produced by the growth of certain strains of *Streptomyces rimosus* or obtained by any other means.

Category. Antibacterial.

Dose. Orally, 250 to 500 mg every 6 hours; by intravenous infusion, in a concentration of 0.1 per cent w/v, 1 to 2 g daily.

Description. A pale yellow, crystalline powder; odourless; hygroscopic.

Oxytetracycline Hydrochloride has a potency not less than 835 µg of $C_{22}H_{24}N_2O_9$, per mg, calculated on the anhydrous basis.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with the substance prepared by mixing 25 g of *silica gel G* with 50 ml of a mixture of 2.5 ml of *glycerin* and 47.5 ml of *0.1 M disodium edetate* previously adjusted to pH 7.0 with *dilute ammonia solution*. After spreading the plate, allow it to stand at room temperature till it is dry (70 to 90 minutes).

Mobile phase. The lower layer formed after shaking 200 ml of a mixture of 2 volumes of *ethyl acetate*, 2 volumes of *chloroform* and 1 volume of *acetone* with 25 ml of *0.1 M disodium edetate* previously adjusted to pH 7.0 with *dilute ammonia solution*.

Test solution. Dissolve 0.05 g of the substance under examination in 100 ml of *methanol*.

Reference solution (a). A 0.05 per cent w/v solution of *oxytetracycline hydrochloride RS* in *methanol*.

Reference solution (b). A solution containing 0.05 per cent w/v each of *demethylchlortetracycline hydrochloride RS, oxytetracycline hydrochloride RS* and *tetracycline hydrochloride RS* in *methanol.*

Apply to the plate 1 µl of each solution, freshly prepared. After development, dry the plate in air, expose to the vapours of ammonia and examine in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.

B. To about 0.5 mg add 2 ml of *sulphuric acid*; a red colour is produced. Add the solution to 1 ml of *water*; the colour changes to yellow.

C. Dissolve about 2 mg in 5 ml of a 1 per cent w/v solution of *sodium carbonate* and add 2 ml of *diazotised sulphanilic acid solution*; an orange-red to brownish-red colour is produced.

D. A 5 per cent w/v solution gives the reactions of chlorides (2.3.1).

Tests

pH (2.4.24). 2.0 to 3.0, determined in a 1.0 per cent w/v solution.

Specific optical rotation (2.4.22). –188° to –200°, determined at 20° in a 1 per cent w/v solution in *0.1 M hydrochloric acid.*

Light absorption (2.4.7). Absorbance of a 0.002 per cent w/v solution in *chloride buffer solution pH 2.0* at the maximum at about 353 nm, 0.54 to 0.58.

Light-absorbing impurities. A. Dissolve 20 mg in sufficient of a mixture of 1 volume of *1 M hydrochloric acid* and 99 volumes of *methanol* to produce 10 ml. Absorbance of the resulting solution at about 430 nm, when measured within 1 hour of preparing the solution, not more than 0.50, calculated on the anhydrous basis (2.4.7).

B. Dissolve 0.1 g in sufficient of a mixture of 1 volume of *1 M hydrochloric acid* and 99 volumes of *methanol* to produce 10 ml. Absorbance of the resulting solution at about 490 nm, when measured within 1 hour of preparing the solution, not more than 0.20, calculated on the anhydrous basis (2.4.7).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in 25 ml of *0.01 M hydrochloric acid.*

Reference solution (a). Dissolve 20 mg of *oxytetracycline RS* in 25 ml of *0.01 M hydrochloric acid.*

Reference solution (b). Dissolve 20 mg of *4-epioxytetracycline RS* in 25 ml of *0.01 M hydrochloric acid.*

Reference solution (c). Dissolve 20 mg of *tetracycline hydrochloride RS* in 25 ml of *0.01 M hydrochloric acid.*

Reference solution (d). Dissolve 20 mg of *α-apo-oxytetracycline RS* in 20 ml of *0.01 M sodium hydroxide* and dilute to 250 ml with *0.01 M hydrochloric acid.*

Reference solution (e). Dissolve 20 mg of *β -apo-oxytetracycline RS* in 20 ml of *0.01 M sodium hydroxide* and dilute to 250 ml with *0.01 M hydrochloric acid.*

Reference solution (f). Dilute a mixture of 1.5 ml of reference solution (a), 1.0 ml of reference solution (b), 3.0 ml each of reference solutions (c) (d) and (e) to 25 ml with *0.01 M hydrochloric acid.*

Reference solution (g). Dilute a mixture of 1.0 ml of reference solution (b), 4.0 ml of reference solution (c) and 40.0 ml of reference solution (e) to 200 ml with *0.01 M hydrochloric acid.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with styrene-divinylbenzene co-polymer (8 to 10 µm),
- column temperature. 60°,
- mobile phase: transfer separately 30 g (for mobile phase A) or 100 g (for mobile phase B) of *2-methyl-2-propanol* to volumetric flasks with the aid of 200 ml of *water*; to each flask add 60 ml of *0.33 M phosphate buffer pH 7.5*, 50 ml of a 1.0 per cent w/v solution of *tetrabutylammonium hydrogen sulphate* previously adjusted to pH 7.5 with *2 M sodium hydroxide* and 10 ml of a 0.04 per cent w/v solution of *disodium edetate* previously adjusted to pH 7.5 with *2 M sodium hydroxide* and dilute each solution to 1000.0 ml with *water.*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Carry out a one-step gradient elution in the following manner. Pump a mixture containing 30 volumes of mobile phase B and 70 volumes of mobile phase A for 15 minutes, then pump a mixture containing 30 volumes of mobile phase A and 70 volumes of mobile phase B for 15 minutes and finally equilibrate with the first mixture. Adjust the sensitivity so that the heights of the peaks in the chromatogram obtained with reference solution (f) are at least 50 per cent of full-scale deflection of the recorder.

The test is not valid unless, in the chromatogram obtained with reference solution (f), (a) the resolution between the first peak *(4-epioxytetracycline)* and the second peak (*oxytetracycline*) is at least 4.0, (b) the resolution between the second peak and the third peak (tetracycline) is at least 5.0, (c) the resolution between the fourth peak (*α-apo-oxytetracycline*) and the fifth peak (*β-apo-oxytetracycline*) is at least 3.5, and (d) the symmetry factor of the second peak

is at most 1.25. If necessary adjust the proportions of the mobile phases used to produce the one-step gradient elution. Adjust the time-programme for the one-step gradient elution if necessary.

Inject reference solution (a) six times. The test is not valid if the relative standard deviation of the area of the peak due to oxytetracycline is greater than 1.0 per cent. If necessary, adjust the integrator parameters.

Inject the test solution and reference solution (g). In the chromatogram obtained with the test solution the area of any peak corresponding to *4-epioxytetracycline* or *tetracycline* is not greater than the area of the corresponding peak in the chromatogram obtained with reference solution (g) and the total area of the peaks corresponding to α-*apo-oxytetracycline* and to β -*apo-oxytetracycline* and any peak between the latter two is not greater than the area of the peak due to β -*apo-oxytetracycline* in the chromatogram obtained with reference solution (g). In the chromatogram obtained with the test solution the area of any peak appearing on the tail of the principal peak is not greater than 4.0 times that of the peak due to 4-epioxytetracycline in the chromatogram obtained with reference solution (g).

Heavy metals (2.3.13). 0.4 g complies with the limit test for heavy metals, Method B (50 ppm).

Sulphated ash (2.3.18). Not more than 0.5 per cent.

Water (2.3.43). Not more than 2.0 per cent w/w, determined on 0.5 g.

Assay. Determine by the microbiological assay of antibiotics, Method A or B (2.2.10), and express the result in µg of oxytetracycline, $C_{22}H_{24}N_2O_9$, per mg.

Oxytetracycline Hydrochloride intended for use in the manufacture of parenteral preparations without a further procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.4 Endotoxin Unit per mg.

Oxytetracycline Hydrochloride intended for use in the manufacture of parenteral preparations without a further sterilisation procedure complies with the following additional requirement.

Sterility. Complies with test for sterility (2.2.11).

Storage. Store protected from light and moisture. If it is intended for use in the manufacture of parenteral preparations, the container should be sterile and sealed so as to exclude micro-organisms.

Labelling. The label states whether or not the contents are intended for use in the manufacture of parenteral preparations.

Oxytetracycline Capsules

Oxytetracycline Hydrochloride Capsules

Oxytetracycline Capsules contain not less than 95.0 per cent and not more than 110.0 per cent of the stated amount of oxytetracycline hydrochloride, $C_{22}H_{24}N_2O_9$,HCl.

Usual strengths. 250 mg; 500 mg.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with the substance prepared by mixing 25 g of *silica gel G* with 50 ml of a mixture of 2.5 ml of *glycerin* and 47.5 ml of *0.1 M disodium edetate* previously adjusted to pH 7.0 with *dilute ammonia solution*. After spreading the plate, allow it to stand at room temperature till it is dry (70 to 90 minutes).

Mobile phase. The lower layer formed after shaking 200 ml of a mixture of 2 volumes of *ethyl acetate*, 2 volumes of *chloroform* and 1 volume of *acetone* with 25 ml of *0.1 M disodium edetate* previously adjusted to pH 7.0 with *dilute ammonia solution*.

Test solution. Extract a quantity of the contents of the capsules containing 10 mg of Oxytetracycline Hydrochloride with 20 ml *methanol*, centrifuge and use the supernatant liquid.

Reference solution (a). A 0.05 per cent w/v solution of *oxytetracycline hydrochloride RS* in *methanol*.

Reference solution (b). A solution containing 0.05 per cent w/v each of *demethylchlortetracycline hydrochloride RS, oxytetracycline hydrochloride RS* and *tetracycline hydrochloride RS* in *methanol*.

Apply to the plate 1 µl of each solution, freshly prepared. After development, dry the plate in air, expose to the vapours of ammonia and examine in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.

B. To 0.5 mg of the contents of the capsules add 2 ml of *sulphuric acid*; a red colour is produced. Add the solution to 1 ml of *water*; the colour changes to yellow.

C. Dissolve about 2 mg of the contents of the capsules in 5 ml of a 1 per cent w/v solution of *sodium carbonate* and add 2 ml of *diazotised sulphanilic acid solution*; a light brown colour is produced.

D. The contents of the capsules give the reactions of chlorides (2.3.1).

Tests

Light-absorbing impurities. Dissolve a portion of the mixed contents of five capsules as completely as possible in sufficient of a mixture of 1 volume of *1 M hydrochloric acid* and 99 volumes of *methanol* to produce two solutions of Oxytetracycline Hydrochloride containing (1) 0.2 per cent w/v and (2) 1.0 per cent w/v and filter each solution. Absorbance of the filtrate obtained from solution (1) at about 430 nm, when measured within 1 hour of preparing the solution, not greater than 0.75 and of the filtrate obtained from solution (2) at about 490 nm, not more than 0.40 (2.4.7).

Dissolution (2.5.2).

Apparatus No. 1,
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter disc with an average pore diameter not greater than 1.0 µm. Measure the absorbance of the filtrate, suitably diluted if necessary, at the maximum at about 353 nm (2.4.7). Calculate the content of $C_{22}H_{24}N_2O_9$,HCl in the medium taking 282 as the specific absorbance at 353 nm.

D. Not less than 75 per cent of the stated amount of $C_{22}H_{24}N_2O_9$,HCl.

Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 1.0 g of the mixed contents of the capsules by drying in an oven at 60° at a pressure not exceeding 0.7 kPa for 3 hours.

Other tests. Comply with the tests stated under Capsules.

Assay. Weigh accurately a quantity of the mixed contents of 20 capsules containing about 0.25 g of Oxytetracycline Hydrochloride, add 250.0 ml of *water*, shake, filter.

Determine by the microbiological assay of antibiotics, Method A or B (2.2.10), and express the results in mg of oxytetracycline hydrochloride per capsule taking each mg of oxytetracycline to be equivalent to 1.079 mg of oxytetracycline hydrochloride, $C_{22}H_{24}N_2O_9$,HCl.

Storage. Store protected from light and moisture.

Oxytetracycline Eye Ointment

Oxytetracycline Hydrochloride Eye Ointment

Oxytetracycline Eye Ointment contains not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of oxytetracycline hydrochloride, $C_{22}H_{24}N_2O_9$,HCl.

Usual strength. 1 per cent w/w.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with the substance prepared by mixing 25 g of *silica gel G* with 50 ml of a mixture of 2.5 ml of *glycerin* and 47.5 ml of *0.1 M disodium edetate* previously adjusted to pH 7.0 with *dilute ammonia solution*. After spreading the plate, allow it to stand at room temperature till it is dry (70 to 90 minutes).

Mobile phase. The lower layer formed after shaking 200 ml of a mixture of 2 volumes of *ethyl acetate*, 2 volumes of *chloroform* and 1 volume of *acetone* with 25 ml of *0.1 M disodium edetate* previously adjusted to pH 7.0 with *dilute ammonia solution*.

Test solution. A solution prepared by heating a quantity containing 20 mg of Oxytetracycline Hydrochloride with 20 ml of *methanol* for 20 minutes, cooling in ice, filtering, carefully evaporating the filtrate to dryness and dissolving the residue in 20 ml of *methanol*.

Reference solution (a). A 0.05 per cent w/v solution of *oxytetracycline hydrochloride RS* in *methanol*.

Reference solution (b). A solution containing 0.05 per cent w/v each of *demethylchlortetracycline hydrochloride RS, oxytetracycline hydrochloride RS* and *tetracycline hydrochloride RS* in *methanol*.

Apply to the plate 1 µl of each solution, freshly prepared. After development, dry the plate in air, expose to the vapours of ammonia and examine in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.

Tests

Water (2.3.43). Not more than 1.0 per cent, determined on 0.5 g.

Other tests. Complies with the tests stated under Eye Ointments.

Assay. Weigh accurately about 1.0 g and transfer to a separating funnel. Add 25 ml of *peroxide-free ether*, shake well and extract with five quantities, each of 20 ml, of *0.1 M hydrochloric acid*. Combine the extracts and dilute to 200.0 ml with *0.1 M hydrochloric acid*. Dilute a suitable volume of the resulting solution with *buffer solution No 3* (2.2.10), to produce a solution containing 1 µg of oxytetracycline per ml.

Determine by the microbiological assay of antibiotics, Method B (2.2.10), and express the results as a percentage of oxytetracycline hydrochloride taking each mg of oxytetracycline to be equivalent to 1.079 mg of oxytetracycline hydrochloride, $C_{22}H_{24}N_2O_9$,HCl.

Storage. Store protected from light and moisture.

Oxytetracycline Hydrochloride Injection

Oxytetracycline Hydrochloride Injection is a sterile material consisting of Oxytetracycline Hydrochloride with or without buffering agents and other excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution may be used within three days of preparation when stored in a refrigerator (2° to 8°).

Oxytetracycline Hydrochloride Injection contains not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of oxytetracycline, $C_{22}H_{24}N_2O_9$.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Usual strengths. The equivalent of 250 mg and 500 mg of oxytetracycline.

Description. A pale yellow, crystalline powder.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with the substance prepared by mixing 25 g of *silica gel G* with 50 ml of a mixture of 2.5 ml of *glycerin* and 47.5 ml of *0.1 M disodium edetate* previously adjusted to pH 7.0 with *dilute ammonia solution*. After spreading the plate, allow it to stand at room temperature till it is dry (70 to 90 minutes).

Mobile phase. The lower layer formed after shaking 200 ml of a mixture of 2 volumes of *ethyl acetate*, 2 volumes of *chloroform* and 1 volume of *acetone* with 25 ml of *0.1 M disodium edetate* previously adjusted to pH 7.0 with *dilute ammonia solution*.

Test solution. Dissolve 0.05 g of the substance under examination in 100 ml of *methanol*.

Reference solution (a). A 0.05 per cent w/v solution of *oxytetracycline hydrochloride RS* in *methanol*.

Reference solution (b). A solution containing 0.05 per cent w/v each of *demethylchlortetracycline hydrochloride RS, oxytetracycline hydrochloride RS* and *tetracycline hydrochloride RS* in *methanol*.

Apply to the plate 1 µl of each solution, freshly prepared. After development, dry the plate in air, expose to the vapours of ammonia and examine in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.

B. To about 0.5 mg add 2 ml of *sulphuric acid*; a red colour is produced. Add the solution to 1 ml of *water*; the colour changes to yellow.

C. Dissolve about 2 mg in 5 ml of a 1 per cent w/v solution of *sodium carbonate* and add 2 ml of *diazotised sulphanilic acid solution*; an orange-red to brownish-red colour is produced.

Tests

Appearance of solution. A 10.0 per cent w/v solution is clear (2.4.1) and yellow.

pH (2.4.24). 2.0 to 3.0, determined in a 1.0 per cent w/v solution.

Light-absorbing impurities. A. Dissolve 20 mg in sufficient of a mixture of 1 volume of *1 M hydrochloric acid* and 99 volumes of *methanol* to produce 10 ml. Absorbance of the resulting solution at about 430 nm, when measured within 1 hour of preparing the solution, not more than 0.50, calculated on the anhydrous basis (2.4.7).

B. Dissolve 0.1 g in sufficient of a mixture of 1 volume of *1 M hydrochloric acid* and 99 volumes of *methanol* to produce 10 ml. Absorbance of the resulting solution at about 490 nm, when measured within 1 hour of preparing the solution, not more than 0.20, calculated on the anhydrous basis (2.4.7).

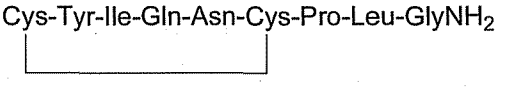
Assay. Determine by the microbiological assay of antibiotics, method A or B (2.2.10), and express the result in µg of oxytetracycline, $C_{22}H_{24}N_2O_9$, per mg.

Bacterial endotoxins (2.2.3). Not more than 0.4 Endotoxin Unit per mg.

Storage. Store protected from light and moisture.

Labelling. The label states (1) the quantity of Oxytetracycline Hydrochloride contained in it in terms of the equivalent amount of oxytetracycline; (2) that the contents are to be used for intravenous injection only; (3) the names of the buffering agents used.

Oxytocin



$C_{43}H_{66}N_{12}O_{12}S_2$ Mol. Wt.1007.2

Oxytocin is a cyclic nonapeptide hormone obtained by a process of fractionation from the posterior lobe of the pituitary

gland of healthy oxen or other mammals or by synthesis that has the property of stimulating contraction of the uterus and milk ejection in receptive animals. It may be presented as a solid or as a solution in a solvent containing an appropriate antimicrobial preservative such as 0.2 per cent w/v solution of chlorbutol.

If it is derived from animal species, Oxytocin contains not less than 95.0 per cent and not more than 105.0 per cent of the stated number of Units of oxytocic activity. If it is a synthetic product presented as a solid, it contains not less than 560 Units per mg, calculated with reference to the peptide content and when presented as a liquid, it contains not less than 150 Units per ml.

Category. Oxytocic.

Description. When presented as a solid, a white or almost white powder. When presented as a liquid, a clear colourless liquid.

Identification

Test B may be omitted if tests A and C are carried out. Test C may be omitted if tests A and B are carried out.

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. Amino acid analysis.

For hydrolysis—Acid hydrolysis using *hydrochloric acid* containing phenol is the most common procedure used for protein/peptide hydrolysis preceding amino acid analysis. The addition of phenol to the reaction prevents the halogenation of tyrosine.

Hydrolysis solution. 6 M hydrochloric acid containing 0.1 per cent to 1.0 per cent of *phenol.*

Procedure

Liquid phase hydrolysis. Place the protein or peptide sample in a hydrolysis tube, and dry (the sample is dried so that water in the sample will not dilute the acid used for the hydrolysis). Add 200 µl of hydrolysis solution per 500 µg of lyophilised protein. Freeze the sample tube in a dry ice-acetone bath, and flame seal in vacuum. Samples are typically hydrolysed at 110° for 24 hours in vacuum or in an inert atmosphere to prevent oxidation. Longer hydrolysis times (e.g. 48 hours and 72 hours) are investigated if there is a concern that the protein is not completely hydrolysed.

Vapour phase hydrolysis. This is one of the most common acid hydrolysis procedures, and it is preferred for microanalysis when only small amounts of the sample are available. Contamination of the sample from the acid reagent is also minimised by using vapour phase hydrolysis. Place vials containing the dried samples in a vessel that contains an appropriate amount of hydrolysis solution. The hydrolysis solution does not come in contact with the test sample. Apply an inert atmosphere or vacuum (less than 200 µm of mercury or 26.7 Pa) to the headspace of the vessel, and heat to about 110° for a 24 hours hydrolysis time. Acid vapour hydrolysis the dried sample. Any condensation of the acid in the sample vials is to be minimised. After hydrolysis, dry the test sample in vacuum to remove any residual acid.

For analysis—Post-column ninhydrin derivatisation . Ion-exchange chromatography with post-column ninhydrin derivatisation is one of the most common methods employed for quantitative amino acid analysis. As a rule, a lithium-based cation-exchange system is employed for the analysis of the more complex physiological samples, and the faster sodium-based cation-exchange system is used for the more simplistic amino acid mixtures obtained with protein hydrolysates (typically containing 17 amino acid components). Separation of the amino acids on an ion-exchange column is accomplished through a combination of changes in pH and cation strength. A temperature gradient is often employed to enhance separation.

When the amino acid reacts with ninhydrin, the reactant has a characteristic purple or yellow colour. Amino acids, except imino acid, give a purple colour, and show an absorption maximum at 570 nm. The imino acids such as proline give a yellow colour, and show an absorption maximum at 440 nm. The post-column reaction between ninhydrin and amino acids eluted from the column is monitored at 440 nm and 570 nm, and the chromatogram obtained is used for the determination of amino acid composition.

The detection limit is considered to be 10 pmol for most of the amino acid derivatives, but 50 pmol for the proline derivative. Response linearity is obtained in the range of 20-500 pmol with correlation coefficients exceeding 0.999. To obtain good composition data, samples larger than 1 µg before hydrolysis are best suited for this amino acid analysis of protein/peptide.

Express the content of each amino acid in moles. Calculate the relative proportions of the amino acids, taking 1/6 of the sum of the number of moles of aspartic acid, glutamic acid, proline, glycine, isoleucine and leucine as equal to 1.

The values fall within the following limits: aspartic acid: 0.90 to 1.10; glutamic acid: 0.90 to 1.10; proline: 0.90 to 1.10; glycine: 0.90 to 1.10; leucine: 0.90 to 1.10; isoleucine: 0.90 to 1.10; tyrosine: 0.7 to 1.05; half-cystine: 1.4 to 2.1. Not more than traces of other amino acids are present.

C. For biological response, dissect out the uterus from a virgin female rat weighing between 120 to 200 g and in diestrus stage. Immediately before injection confirm the uterine stage of the rat by vaginal smear. Suspend one horn of the uterus in a

organ bath containing 9.0 g of *sodium chloride*, 0.42 g of *potassium chloride*, 0.16 g of *calcium chloride*, 0.50 g of *sodium bicarbonate*, 0.25 g of *dextrose*, and 0.0053 g of *magnesium chloride* per litre of the solution. Maintain the bath temperature at 32° or any other suitable temperature at which spontaneous contractions of the uterus are abolished and the preparations maintain its sensitivity. Oxygenate the bath solution with a mixture of 95 per cent *oxygen* and 5 per cent *carbon dioxide*. Record the contractions of the uterine muscle on a recorder, using a suitable instrument producing linear response (for example an isotonic liver with a load of not exceeding 2 g or isotonic and linear transducer). Add to the bath two appropriate dilutions of the oxytocin reference solution, and record the contraction of the muscle following each dilution. The appropriate dilutions (doses) are those dilutions of the reference solution which produce clearly distinctive submaximal contractions. The required dilution normally lies between 0.1 to 5 micro units per ml of the bath solution. When maximal contraction is reached, replace the bath solution by a fresh solution and wait until the muscle is relaxed completely and the pointer of the recorder returns to the base line. The doses of the different reference solutions should be added at regular intervals depending upon the rate of the recovery of the uterine muscle. Dissolve or dilute the preparation to be tested in a suitable diluent (preferably using bath solution) to obtain responses on the addition of two dilutions similar to the one used with the oxytocin reference solution. The two selected dilutions of the reference solution and preparation under examination should be applied according to a randomised block or Latin square design and at least three responses to each dilution should be recorded. The magnitude of contractions obtained with the reference solution is comparable to the contractions obtained with the test solution.

Tests

Peptide. 90.0 to 110.0 per cent of the stated amount of oxytocin, $C_{43}H_{66}N_{12}O_{12}S_2$ expressed per mg for the solid, and in mg per ml for the liquid,

Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 3.5 mg of the substance under examination in sufficient of a 1.56 per cent w/v solution of *sodium dihydrogen phosphate* to produce 10.0 ml or use the liquid preparation as appropriate.

Reference solution. Dissolve 3.5 mg of *oxytocin RS* in sufficient of a 1.56 per cent w/v solution of *sodium dihydrogen phosphate* to produce 10.0 ml.

Chromatographic system

- a stainless steel column 12 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: appropriate proportions of a 1.56 per cent w/v solution of *sodium dihydrogen phosphate* (mobile phase A) and a mixture of equal volumes of *acetonitrile* and *water* (mobile phase B),
- flow rate. 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume: 20 µl

Equilibrate the column with a mixture of 70 volumes of mobile phase A and 30 volumes of mobile phase B and record the chromatograms as follows. Operate by gradient elution increasing continuously and linearly the proportion of mobile phase B by 1.0 per cent v/v per minute for 30 minutes. Finally elute using the same mixture for 15 minutes to re-equilibrate the column.

Calculate the content of the peptide, $C_{43}H_{66}N_{12}O_{12}S_2$.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 25 mg of the substance under examination in 100 ml of mobile phase A.

Reference solution. A 0.025 per cent w/v solution of *oxytocin RS* in mobile phase A.

Chromatographic system

- a stainless steel column 12.5 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a 1.6 per cent w/v solution of *sodium dihydrogen phosphate*,
  B. a mixture of 50 volumes of *acetonitrile* and 50 volumes of *water*,
- a linear gradient programme using the conditions given below,
- flow rate. 1 ml per minute,
- spectrophotometer set at 220 nm,

injection volume. 25 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0 – 30	70 → 40	30 → 60
30 – 30.1	40 → 70	60 → 30
30.1 – 45	70	30

Inject the test solution and the reference solution.

Calculate the content of $C_{43}H_{66}N_{12}O_{12}S_2$.

Oxytocin intended for use in the manufacture of parenteral preparations without a further procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Less than 0.5 Endotoxin Units per Unit of oxytocin.

Oxytocin intended for use in the manufacture of parenteral preparations without a further sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from moisture. If the substance is intended for use in the manufacture of parenteral preparations, the container should be sterile, tamper-evident and sealed so as to exclude micro-organisms.

Labelling. The label states (1) the number of Units of oxytocic activity per mg (for solid) or per ml (for liquid); (2) either the animal species from which it is obtained or whether it is synthetic, as appropriate; (3) whether or not the contents are intended for use in the manufacture of parenteral preparations.

Oxytocin Injection

Oxytocin Injection is a sterile solution of Oxytocin in Water for Injections.

Oxytocin Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated number of Units of oxytocin activity.

Usual strengths. 5 Units per ml; 10 Units per ml.

Description. A clear colourless liquid.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 3.0 to 5.0

Bacterial endotoxins (2.2.3). Less than 0.5 Endotoxin Units per Unit of oxytocin.

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Use the injection under examination.

Reference solution. Dissolve the contents of one vial of *oxytocin RS* in a 1.65 per cent w/v solution of *sodium dihydrogen orthophosphate* to produce a solution containing the same concentration in µg of oxytocin as that stated on the label of the injection.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm) (such as Nucleosil C18),
- column temperature. 40°,
- mobile phase: a mixture of 85 volumes of a 0.2 per cent v/v solution of *orthophosphoric acid* and 15 volumes of *acetonitrile*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume. 200 µl.

Inject the reference solution. The test is not valid unless the theoretical plates are not less than 50,000.

Inject the test solution and the reference solution.

Calculate the content of $C_{43}H_{66}N_{12}O_{12}S_2$ in the injection.

Oxytocin Injection containing Oxytocin of natural origin obtained by extraction and purification complies with the following additional requirement.

Vasopressin impurity. Not more than 0.5 Unit per ml.

Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 5.0 g of chlorobutanol in 5.0 ml of *glacial acetic acid*, add 1.1 g of *sodium acetate*, 5.0 g of *ethanol*, and dilute to 1000 ml with *water* and mix.

Test solution. Dilute 2.0 ml of injection under examination to 25 ml with 0.25 per cent w/v of *glacial acetic acid* and mix.

Reference solution. Dissolve the contents of one vial of *vasopressin RS* in a known volume of solvent mixture. If necessary dilute the prepared solution to a working concentration range.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- column temperature. 30°,
- mobile phase: a mixture of 87 volumes of 6.6 per cent v/v solution of *dibasic ammonium phosphate*, adjusted to pH 3.0 with *orthophosphoric acid* and 13 volumes of *acetonitrile*, filter through 0.45 µm nylon membrane,
- flow rate. 1 ml per minute,
- spectrophometer set at 220 nm,
- injection volume. 20 µl.

Equilibrate the column at least for one hour. Run the chromatogram minimum of 60 minutes.

Inject the reference solution. The test is not valid unless the resolution between vasopressin and the adjacent peak is not less than 1.5 and relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

Labelling. The label states (1) the number of Units of oxytocin activity per ml; (2) either the animal spieces from which it is obtained or whether it is synthetic, as appropriate.

Oxytocin Nasal Solution

Oxytocin Nasal Solution is a solution of Oxytocin in a suitable solvent containing an appropriate antimicrobial preservative.

Oxytocin Nasal Solution contains not less than 85.0 per cent and not more than 120.0 per cent of the stated number of Units of oxytocic activity.

Usual strength. 40 Units per ml.

Description. A clear, colourless solution.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 3.0 to 5.0

Other tests. Complies with the tests stated under Nasal Preparations.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Use the nasal solution under examination.

Reference solution. Dissolve the contents of one vial of *oxytocin RS* in a 1.65 per cent w/v solution of *sodium dihydrogen orthophosphate* to produce a solution containing the same concentration in µg of oxytocin as that stated on the label of the nasal solution.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm) (such as Nucleosil C18),
- column temperature. 40°,
- mobile phase: a mixture of 85 volumes of a 0.2 per cent v/v solution of *orthophosphoric acid* and 15 volumes of *acetonitrile*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume. 200 µl.

Inject the reference solution. The test is not valid unless the theoretical plates is not less than 50,000.

Inject the test solution and the reference solution.

Calculate the content of $C_{43}H_{66}N_{12}O_{12}S_2$ in the nasal solution.

Oxytocin Nasal Solution containing Oxytocin of natural origin obtained by extraction and purification complies with the following additional requirement.

Vasopressin impurity. Not more than 0.5 Unit per ml.

Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 5.0 g of chlorobutanol in 5.0 ml of *glacial acetic acid*, add 1.1 g of *sodium acetate*, 5.0 g of *ethanol*, and dilute to 1000 ml with *water* and mix.

Test solution. Dilute 2.0 ml of injection under examination to 25 ml with 0.25 per cent w/v of *glacial acetic acid* and mix.

Reference solution. Dissolve the contents of one vial of *vasopressin RS* in a known volume of solvent mixture. If necessary dilute the prepared solution to a working concentration range.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- column temperature. 30°,
- mobile phase: a mixture of 87 volumes of 6.6 per cent v/v solution of *dibasic ammonium phosphate*, adjusted to pH 3.0 with *orthophosphoric acid* and 13 volumes of *acetonitrile*, filter through 0.45 µm nylon membrane,
- flow rate. 1 ml per minute,
- spectrophometer set at 220 nm,
- injection volume. 20 µl.

Equilibrate the column at least for one hour. Run the chromatogram minimum of 60 minutes.

Inject the reference solution. The test is not valid unless the resolution between vasopressin and the adjacent peak is not less than 1.5 and relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the reference solution and the test solution.

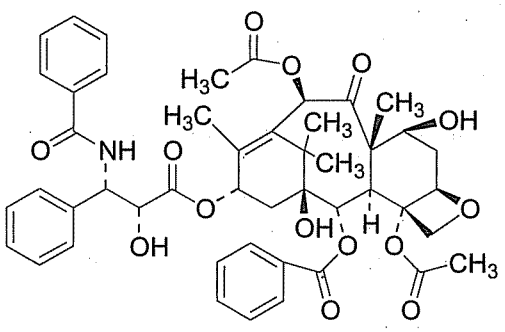
Storage. Store at a temperature not exceeding 30°.

Labelling. The label states (1) the number of Units of oxytocic activity per ml; (2) either the animal species from which it is obtained or whether it is synthetic, as appropriate; (3) that the preparation is intended for intranasal administration only.

P

Paclitaxel

Taxol



$C_{47}H_{51}NO_{14}$ Mol. Wt. 853.9

Paclitaxel is 5β,20-epoxy-1,2α4,7β,10β,13α-hexahydroxytax-11-en-9-one 4,10-diacetate 2-benzoate 13-ester with(2*R*,3*S*)-*N*-benzoyl-3-phenylisoserine.

A taxane derivative first isolated from the bark of the Pacific yew tree, *Taxus brevifolia*.

Paclitaxel contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{47}H_{51}NO_{14}$, calculated on the anhydrous basis.

Category. Anticancer.

Description. A white or almost white powder.

CAUTION — Paclitaxel is potentially cytotoxic. Great care should be taken in handling the powder and preparing solutions.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *paciltaxel RS*.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). −49.0° to −55.0°, determined in 1.0 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 10 mg of substance under examination in 10 ml of *acetonitrile*.

Reference solution (a). A 0.001 per cent w/v solution of *paclitaxel RS* in *acetonitrile*.

Reference solution (b). A solution containing 0.008 per cent w/v of 10 deacetyl-7-epipaclitaxel and 0.1 per cent w/v of *paclitaxel RS* in *acetonitrile*.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3μm),
- column temperature. 35°,
- mobile phase: A. a mixture of 60 volumes of *water* and 40 volumes of *acetonitrile*,
  B. *acetonitrile*
- flow rate. 1.2 ml per minute,
- a linear gradient programme using the conditions given below,
- spectrophotometer set at 227nm,
- injection volume. 10 μl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
20	100	0
60	10	90
62	100	0
70	100	0

Inject reference solution (b). The test is not valid unless the resolution between the peak due to paclitaxel and 10-deacetyl-7-epipaclitaxel is not less than 1.2. The relative retention time for 10-deacetyl-7-epipaclitaxel is about 0.94 in respect to paclitaxel.

Inject the test solution and reference solution (a). In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the peak in the chromatogram obtained with the reference solution (a) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the peak in the chromatogram obtained with the reference solution (a) (2.0 per cent).

Heavy metals (2.3.13). 1 g complies with the limit test for heavy metals, Method B (20ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 4.0 per cent, determined on 0.1 g by coloumetry method.

Bacterial endotoxins (2.2.3). Not more than 0.4 Endotoxin Unit per mg of paclitaxel.

Microbial contamination (2.2.9). The total viable aerobic count does not exceed 100 cfu per g. It meets the requirements of the tests for the absence of *Staphylococcus aureus*, *Pseudomonas aeruginosa*, *Salmonella species*, and *Escherichia coli*.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 200 μl of *glacial acetic acid* in 1000 ml of *methanol*.

Test solution. Dissolve 0.1 g of the substance under examination in 100.0 ml in solvent mixture.

Reference solution. A 0.1 per cent w/v solution of *paclitaxel RS* in solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with pentafluoro phenyl groups bonded to porous silica (5 µm),
- column temperature 35°,
- mobile phase: a mixture of 11 volumes of *water* and 9 volumes of *acetonitrile*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 227nm,
- injection volume. 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.5. The relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and reference solution.

Calculate the content of $C_{47}H_{51}NO_{14}$.

Storage. Store protected from light, at a temperature not exceeding 25°.

Paclitaxel Injection

Paclitaxel Injection is a sterile solution of Paclitaxel suitable for dilution,for intravenous use.

Paclitaxel Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of paclitaxel, $C_{47}H_{51}NO_{14}$.

Description. A clear colourless to slight yellow viscous solution.

Identification

In the Assay, the principal peak in the chromatogram obtained with test solution corresponds to the peak in the chromatogram obtained with reference solution.

Tests

pH (2.4.24). 3.0 to 7.0, determined in a 10 per cent v/v solution in *water.*

Light absorption. Absorbance of the injection at about 425 nm, not more than 0.1.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Accurately measure the volume of injection containing 12 mg of Paclitaxel, dilute to 10 ml with *acetonitrile.*

Reference solution (a). A 0.0012 per cent w/v solution of *paclitaxel RS* in *acetonitrile.*

Reference solution (b). A solution containing 0.006 per cent w/v of *10 deacetyl -7-epipaclitaxel RS* and 0.12 per cent w/v of *paclitaxel RS* in *acetonitrile.*

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- column temperature. 35°,
- mobile phase: A. a mixture of 60 volumes of *water* and 40 volumes of *acetonitrile*,
  B. *acetonitrile,*
- flow rate. 1.2 ml per minute,
- a linear gradient programme using the conditions given below,
- spectrophotometer set at 227 nm,
- injection volume. 10 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
26	100	0
66	17	83
67	100	0

Inject reference solution (b). The test is not valid unless the resolution between the peak due to paclitaxel and 10-deacetyl-7-epipaclitaxel is not less than 1.2. The relative retention time for 10-deacetyl-7-epipaclitaxel is about 0.94 in respect to paclitaxel.

Inject the test solution and reference solution (a). In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.8 times the area of the peak in the chromatogram obtained with the reference solution (a) (0.8 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the peak in the chromatogram obtained with the reference solution (a) (2.0 per cent).

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Bacterial endotoxins (2.2.3). Not more than 0.67 Endotoxin Unit per mg of paclitaxel.

Sterility (2.2.11). Complies with the test for sterility.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 200 µl of *glacial acetic acid* in 1000 ml of *methanol.*

Test solution. Accurately measure the volume of injection containing 6 mg of Paclitaxel and dissolve in 10 ml of solvent mixture.

Reference solution. A 0.06 per cent w/v solution of *paclitaxel RS* in solvent mixture.

Chromatographic system
- a stainless steel column 30 cm x 3.9 mm, packed with penta fluro phenyl group chemically bonded to porous silica (5 µm),
- column temperature 35°,
- mobile phase: a mixture of 11 volumes of *water* and 9 volumes of *acetonitrile*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 227nm,
- injection volume. 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.5. The relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and reference solution.

Calculate the content of $C_{47}H_{51}NO_{14}$.

Storage. Store protected from light, at a temperature not exceeding 25°.

Pancreatin

Pancreatin is a preparation of mammalian pancreas containing protease, lipase and amylase activity. It may contain Sodium Chloride.

Pancreatin contains not less than the minimum protease activity, amylase activity and lipase activity determined under the conditions of the Assay.

Category. Digestive enzyme.

Dose. 500 mg to 1 g.

Description. A white or buff-coloured, amorphous powder; odour, meaty and not unpleasant.

Identification

A. Triturate 0.5 g with 10 ml of *water* and adjust to pH 8.0 by the addition of *1 M sodium hydroxide* using *cresol red solution* as indicator. Divide the resulting solution into two equal portions. Boil one portion [solution (1)] and leave the other untreated [solution (2)]. To each add a few shreds of *congo red fibrin*, warm to 39° ± 1° and maintain at this temperature for 1 hour. Solution (2) is stained red and solution (1) is colourless or not more than slightly pink.

B. Triturate 0.25 g with 10 ml of *water* and adjust to pH 8.0 by the addition of *1 M sodium hydroxide* using *cresol red solution* as indicator. Divide the resulting solution into two equal portions. Boil one portion [solution (1)] and leave the other untreated [solution (2)]. Dissolve 0.1 g of *soluble starch* in 100 ml of boiling *water*, boil for 2 minutes, cool and dilute to 150 ml with *water*. Add solution (1) to half the starch mucilage and solution (2) to the remainder and maintain the mixtures at 39° ± 1° for 5 minutes. To 1 ml of each mixture add 10 ml of *iodinated potassium iodide solution*. The liquid containing solution (2) retains the colour of the solution of iodine and the liquid containing solution (1) acquires an intense blue colour.

Tests

Fat. Not more than 5.0 per cent, determined by the following method. Extract 1 g with *light petroleum (40° to 60°)* for 3 hours in an apparatus for the continuous extraction of drugs (2.1.8), evaporate the extract and dry the residue at 105° for 2 hours.

Microbial contamination (2.2.9). 1 g is free from *Escherichia coli*; 10 g is free from *Salmonellae*.

Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 0.5 g by dying in an oven at 60° at a pressure not exceeding 0.7 kPa for 4 hours.

Assay. *For protease activity* — Weigh accurately 4.0 g of purified casein and dissolve in about 90 ml of *water* containing 3 ml of *1 M sodium hydroxide*, adjust the pH of the solution to 8.7 and add sufficient *water* to produce 100.0 ml. Weigh accurately about 0.5 g of the substance under examination, triturate with *water* and add sufficient *water* to produce 300.0 ml to give the test solution. Dilute 15.0 ml of the *casein solution* with 30 ml of *water*, warm to 55° and add 10.0 ml of the unfiltered test solution. Heat rapidly to 55° and keep at this temperature for 20 minutes. Cool rapidly to room temperature. Dilute a further portion of 15.0 ml of the casein solution with 30 ml of *water*, add 10.0 ml of the unfiltered test solution, previously boiled and cooled, heat rapidly to 55° and keep at this temperature for 20 minutes. Cool to room temperature. To each solution add 0.75 ml of *phenolphthalein solution* and 10 ml of *formaldehyde solution*. Titrate each solution with *0.1 M sodium hydroxide* until the colour of the solution matches that produced by mixing 10 ml of *buffer solution pH 8.7* and 0.15 ml of *phenolphthalein solution*. The difference between the two titrations is not less than 4.5 ml.

For lipase activity — To 95 ml of *water*, add 6.5 ml of *triacetin* and 0.2 ml of a 0.1 per cent w/v solution of *bromocresol purple*, neutralise with *0.5 M sodium hydroxide* and add sufficient *water* to produce 110 ml. Place 50 ml of this solution in each of two large tubes 3 cm x 20 cm A and B contained in a thermostat at 30°. Insert in each tube a rubber stopper having two holes, one for the tip of a burette and the other for a short glass tube through which passes a thread operating a glass stirring coil. Stir the contents of the tube until they attain the temperature of the thermostat. Prepare a solution of 0.1 g of the substance under examination in 10.0 ml of *water*. To tube A add 1.0 ml of the solution, to tube B add 1.0 ml of the solution previously boiled. Adjust and maintain the pH of the solutions in the two

tubes to 6.2 to 6.4 by the addition of *0.05 M sodium hydroxide* dropwise, stirring frequently. After 30 minutes, the difference between the volumes of *0.05 M sodium hydroxide* added to the two tubes is not less than 1.0 ml.

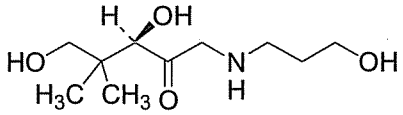
For amylase activity—Not less than 100 Units per g. Dissolve 0.1 g or a quantity containing 10 Units, accurately weighed, in sufficient *buffer solution pH 6.8* to produce 1000.0 ml. Filter if necessary (1 ml of the test solution should be capable of digesting about 10 mg of dry soluble maize or corn starch). Into each of six stoppered test-tubes add 5.0 ml of *starch substrate* without touching the sides of the test-tube. Place the test-tubes in a *water*-bath maintained at 40° ± 0.1°. When the temperature of the solution in the tubes has reached 40°, add 0.35 ml, 0.4 ml, 0.45 ml, 0.5 ml, 0.55 ml and 0.6 ml of the test solution to each of the test-tubes marked 1 to 6 respectively and record the time of addition. Mix thoroughly and replace the tubes in the *water*-bath. After exactly 60 minutes remove the tubes and cool rapidly in cold water. Add to each tube 0.05 ml of *0.02 M iodine* and mix well. Note the tube containing the lowest volume of test solution, which does not show a bluish or violet tinge (if there is doubt, warm the solution slightly, when the colour distinction is prominent). From this volume calculate the number of grams of dry soluble maize or corn starch digested by 1.0 g of the substance under examination. This represents the number of Units of amylase activity per g.

Storage. Store protected from moisture.

Labelling. The label states the name of any added substance.

D-Panthenol

Pantothenol; Dextro-pantothenyl Alcohol



$C_9H_{19}NO_4$ Mol. Wt. 205.3

D-Panthenol is (*R*)-2,4-dihydroxy-*N*-(3-hydroxypropyl)-3, 3-dimethylbutanamide.

D-Panthenol contains not less than 6.60 per cent and not more than 6.95 per cent of nitrogen, N.

Category. Vitamin B (enzyme co-factor).

Dose. 250 to 500 mg.

Description. A clear, colourless or slightly yellow, viscous liquid; odourless.

Identification

Boil 50 mg with 5 ml of *0.1 M sodium hydroxide* for 1 minute, cool and add 5 ml of *1 M hydrochloric acid* and 0.1 ml of *ferric chloride test solution*; a deep yellow colour is produced.

Tests

pH (2.4.24). Not more than 10.5, determined in a 5.0 per cent w/v solution in *carbon dioxide-free water*.

Specific optical rotation (2.4.22). +28.2° to +30.2°, determined at 20° in a 5.0 per cent w/v solution.

Refractive index (2.4.27). 1.490 to 1.498, determined at 20°.

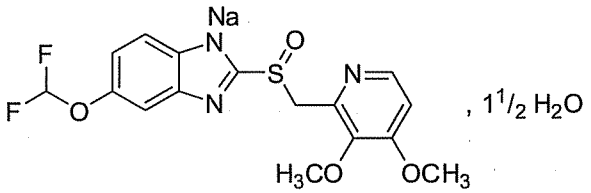
Heavy metals (2.3.13). 1.0 g dissolved in 25 ml of *water* complies with the limit test for heavy metals, Method A (20 ppm).

Assay. Weigh accurately about 0.5 g and carry out Method A for the determination of nitrogen (2.3.30).

1 ml of *0.05 M sulphuric acid* is equivalent to 0.001401 g of N.

Storage. Store protected from moisture.

Pantoprazole Sodium



$C_{16}H_{14}F_2N_3NaO_4S, 1½ H_2O$ Mol. Wt. 432.4

Pantoprazole Sodium is sodium 5-(difluromethoxy)-2[[(3,4 dimethoxy-pyridin-2-yl)methyl]sulphinyl]benzimidazol-1-ide, sesquihydrate.

Pantoprazole Sodium contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{16}H_{14}F_2N_3NaO_4S$, calculated on the anhydrous basis.

Category. Antiulcer.

Description. A white to off-white powder.

Identification

Test A may be omitted if tests B and C are carried out. Test B may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pantoprazole sodium RS* or with the reference spectrum of pantoprazole sodium.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

C. Gives the reaction (a) of sodium (2.3.1).

Tests

Optical rotation (2.4.22). -0.40° to +0.40°, determined on 1.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Equal volumes of *acetonitrile* and *0.001 M sodium hydroxide.*

Test solution. Dissolve about 23 mg of the substance under examination in 50.0 ml of the solvent mixture.

Reference solution. A 0.06 per cent w/v solution of *pantoprazole sodium RS* in the solvent mixture. Dilute 2.5 ml of the solution to 50.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 12.5 cm x 4.0 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS-3),
- column temperature. 40°,
- mobile phase: A. dissolve 1.74 g of *dibasic potassium phosphate* to 1000 ml with *water*, adjusted to pH 7.0 with *orthophosphoric acid*,
  B. *acetonitrile*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 290 nm,
- injection volume. 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0-40	80→20	20→80
40-45	20	80
45-55	20→80	80→20

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution. In the chromatogram obtained with the test solution the area of the peak due to impurity C determined at wavelength 305 nm at relative retention time about 0.6 is not more than 0.77 times the area of the principal peak at 290 nm in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of any secondary peak is not more than 0.077 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than 0.15 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Water (2.3.43). Not less than 5.0 per cent and not more than 8.0 per cent, determined on 0.15 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture (a). Dilute 25.0 ml of *ammonium hydroxide* to 500.0 ml with *water.*

Solvent mixture (b). Equal volumes of *acetonitrile* and *water.*

Test solution. Dissolve about 20 mg of the substance under examination 10.0 ml of solvent mixture (b) and dilute to 50.0 ml with solvent mixture (a). Dilute 3.0 ml of this solution to 20.0 ml with solvent mixture (a).

Reference solution. Dissolve 20 mg of *pantoprazole sodium RS* in 10.0 ml of solvent mixture (b) and dilute to 50.0 ml with solvent mixture (a). Dilute 3.0 ml of this solution to 20.0 ml with solvent mixture (a).

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm packed with octadecylsilane bonded to porous silica (4 µm) (Such as Inertsil ODS-3),
- column temperature. 30°,
- sample temperature. 4°,
- mobile phase: A. a mixture of 85 volumes of buffer solution prepared by dissolving 1.32 g of *dibasic ammonium phosphate* to 1000 ml with *water*, adjusted to pH 7.5 with *orthophosphoric acid* and 15 volumes of *acetonitrile*,
  B. a mixture of 7 volumes of *acetonitrile* and 3 volumes of *methanol*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 285 nm,
- injection volume. 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0-10	86	14
35	42	58
36	86	14
46	86	14

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{16}H_{14}F_2N_3NaO_4S$.

Storage. Store protected from light and moisture, between 2° to 8°.

Pantoprazole Sustained-release Tablets

Pantoprazole Sodium Sustained-release Tablets

Pantoprazole Sustained-release Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of pantoprazole, $C_{16}H_{15}F_2N_3O_4S$.

Usual strenth. 40 mg.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

B. When examined in the range 230 nm to 350 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* shows absorption maxima at about 289 nm.

Tests

Dissolution (2.5.2).

NOTE—Prepare the solutions immediately before use. Protect the solutions from light.

A. Apparatus No. 1,
Medium. 1000 ml of *0.1 M hydrochloric acid,*
Speed and time. 100 rpm and 120 minutes.

Determine by liquid chromatography (2.4.14).

Test solution. Withdraw the medium completely and disperse the intact tablet in 100 ml of the mobile phase and filter.

Reference solution. Dissolve an accurately weighed quantity of *pantoprazole sodium RS* in the mobile phase and dilute with the mobile phase to obtain a solution having a known concentration similar to the test solution.

Use chromatographic system as described under Assay.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{15}F_2N_3O_4S$ released in the acid medium by subtracting the content of $C_{16}H_{15}F_2N_3O_4S$ in the test solution from the total content of Pantoprazole, $C_{16}H_{15}F_2N_3O_4S$ determined in the Assay.

D. Not more than 10 per cent of the stated amount of $C_{16}H_{15}F_2N_3O_4S$.

B. Apparatus No.1,

Medium. 1000 ml of *tris-acetate buffer solution pH 8.5,*
Speed and time. 75 rpm and 60 minutes.

Run method A on another 6 tablets and discard the medium completely and fill the empty vessel with the dissolution medium. Withdraw a suitable volume of the medium and filter. Dilute the filtrate, if necessary, with the dissolution medium. Measure the absorbance at the maximum at about 290 nm (2.4.7). Calculate the content of $C_{16}H_{15}F_2N_3O_4S$ in the medium from the absorbance obtained from a solution of known concentration of *pantoprazole sodium RS.*

D. Not less than 75 per cent of the stated amount of $C_{16}H_{15}F_2N_3O_4S$.

Uniformity of content. Comply with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described in the Assay using the following solutions.

Test solution. Disperse 1 intact tablet in 100.0 ml of the mobile phase and filter.

Reference solution. Dissolve an accurately weighed quantity of *pantoprazole sodium RS* in the mobile phase and dilute with the mobile phase to obtain a solution having a known concentration similar to the test solution.

Inject the reference solution and the test solution.

Calculate the content of $C_{16}H_{15}F_2N_3O_4S$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use. Protect the solutions from light.

Test solution. Weigh and powder 20 tablets. Weigh accurately a quantity of powder containing about 20 mg of Pantoprazole Sodium, disperse in 100 ml of the mobile phase and filter.

Reference solution. A 0.02 per cent w/v solution of *pantoprazole sodium RS* in the mobile phase.

Chromatographic system
- stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (such as Inertsil ODS-3),
- mobile phase: a mixture of 50 volumes of buffer solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* and 1 g of *hexane sulphonic acid sodium salt* in 1000 ml of *water,* adjusted to pH 7.3 with *1 M sodium hydroxide* and 50 volumes of *acetonitrile,*
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 290 nm,
- injection volume.10 µl.

Inject the reference solution. The test is not valid unless the theoretical plates are not less than 2000, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

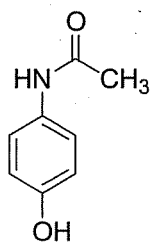
Calculate the content of $C_{16}H_{15}F_2N_3O_4S$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the amount of Pantoprazole.

Paracetamol

Acetaminophen



$C_8H_9NO_2$ Mol. Wt. 151.2

Paracetamol is 4-hydroxyacetanilide.

Paracetamol contains not less than 99.0 per cent and not more than 101.0 per cent of $C_8H_9NO_2$, calculated on the dried basis.

Category. Analgesic; antipyretic.

Dose. 500 mg to 1 g every 4 to 6 hours, upto 4 g daily, in divided doses

Description. White crystals or a white, crystalline powder.

Identification

Test A may be omitted if tests B C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *paracetamol RS* or with the reference spectrum of paracetamol.

B. Dissolve 50 mg in sufficient *methanol* to produce 100 ml. To 1 ml of this solution add 0.5 ml of *0.1 M hydrochloric acid* and dilute to 100 ml with *methanol*. Protect the resulting solution from bright light and immediately measure the absorbance at the maximum at about 249 nm; absorbance at 249 nm, about 0.44 (2.4.7).

C. Boil 0.1 g in 1 ml of *hydrochloric acid* for 3 minutes, add 10 ml of *water* and cool; no precipitate is produced. Add 0.05 ml of *0.0167 M potassium dichromate*; a violet colour develops which does not turn red.

D. Gives the reaction of acetyl groups (2.3.1).

Tests

4-Aminophenol. Dissolve 0.5 g in sufficient *methanol (50 per cent)* to produce 10 ml. Add 0.2 ml of freshly prepared *alkaline sodium nitroprusside solution*, mix and allow to stand for 30 minutes. Any blue colour in the solution is not more intense than that in 10 ml of a solution prepared at the same time and in the same manner containing 0.5 g of *4-aminophenol-free paracetamol* and 0.5 ml of a 0.005 per cent w/v solution of *4-aminophenol* in *methanol (50 per cent)* (50 ppm).

Related substances. Determine by liquid chromatography (2.4.14).

Note—Prepare the solutions immediately before use.

Test solution. Dissolve 0.2 g of the substance under examination in 2.5 ml of *methanol* containing 0.46 per cent w/v of *tetrabutylammonium hydroxide solution* (40 per cent w/v) and dilute to 10.0 ml with the solution containing equal volumes of 1.79 per cent w/v of *disodium hydrogen phosphate* and 0.78 per cent w/v of *sodium dihydrogen phosphate*.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the mobile phase.

Reference solution (c). A solution containing 0.025 per cent w/v each of *4-aminophenol*, *paracetamol RS* and *chloroacetanilide* in *methanol*. Dilute 1.0 ml of this solution to 250.0 ml with the mobile phase.

Reference solution (d). Dissolve 20 mg of *4-nitrophenol* in 50.0 ml of *methanol*. Dilute 1.0 ml of this solution to 20.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature. 35°,
- mobile phase: a mixture of 37.5 volumes of a 1.79 per cent w/v solution of *disodium hydrogen phosphate* , 37.5 volumes of a 0.78 per cent w/v solution of *sodium dihydrogen phosphate* and 25 volumes of *methanol* containing 0.46 per cent v/v of *tetrabutylammonium hydroxide solution (40 per cent w/v)*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume. 20 µl.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to 4-aminophenol (paracetamol impurity K) and paracetamol is not less than 4.0 and the signal-to-noise ratio of the peak due to chloroacetanilide (paracetamol imputity J) is not less than 50. The relative retention time with reference to paracetamol for paracetamol impurity K is about 0.8, for 4-nitrophenol (paracetamol impurity F) is about 3.0 and for paracetamol impurity J is about 7.0.

Inject the test solution, reference solution (a), (b) and (c). Run the chromatogram 12 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of the peak due to paracetamol impurity J is not more than 0.2 times the area of the corresponding peak in the chromatogram obtained with reference solution (c) (10 ppm)

and the area of the peak due to paracetamol impurity K is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (50 ppm). The area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent). The sum of areas of other secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.01 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.5 g, dissolve in a mixture of 10 ml of *water* and 50 ml of *1 M sulphuric acid*. Boil under a reflux condenser for 1 hour, cool and dilute to 100.0 ml with *water*. To 20.0 ml of the solution add 40 ml of *water*, 40 g of *water* in the form of ice, 15 ml of *2 M hydrochloric acid* and 0.1 ml of *ferroin solution* and titrate with *0.1 M ceric ammonium sulphate* until a yellow colour is produced. Carry out a blank titration.

1 ml of *0.1 M ceric ammonium sulphate* is equivalent to 0.00756 g of $C_8H_9No_2$.

Storage. Store protected from light and moisture.

Paracetamol Syrup

Paracetamol Oral Solution; Acetaminophen Syrup

Paracetamol Syrup is a solution of Paracetamol in a suitable flavoured vehicle.

Paracetamol Syrup contains not less than 95.0 per cent and not more than 105.0 per cent w/v solution of the stated amount of paracetamol, $C_8H_9NO_2$.

Usual strength. 125 mg per 5 ml.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 65 volumes of *chloroform*, 25 volumes of *acetone*, 10 volumes of *toluene* and 0.5 volumes of *glacial acetic acid*.

Test solution. Dilute a volume containing 25 mg of Paracetamol to 10 ml with *methanol* and filter if necessary.

Reference solution. A 0.25 per cent w/v solution of *paracetamol RS* in *methanol*

Apply to the plate 10 µl of each solution. After development, dry the plate in a current of warm air, examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution.

Tests

4-Aminophenol. Determine by liquid chromatography (2.4.14).

Test solution. Shake 5 ml of the preparation under examination with 15 ml of the mobile phase, dilute to 25 ml with the mobile phase and filter if necessary.

Reference solution. A 0.0025 per cent w/v solution of *4-aminophenol* in the mobile phase.

Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: *0.01 M sodium butanesulphonate* in a mixture of 85 volumes of *water*, 15 volumes of *methanol* and 0.4 volume of *formic acid*,
- flow rate. 2 ml per minute,
- spectrophotometer set at 272 nm,
- injection volume. 20 µl.

In the chromatogram obtained with the test solution the area of any peak corresponding to 4-aminophenol is not greater than the area of the peak in the chromatogram obtained with the reference solution. In the chromatogram obtained with the test solution peaks with a long retention time may occur due to preservatives in the preparations.

Other tests. Complies with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Mix an accurately weighed quantity of the preparation under examination containing 25 mg of Paracetamol in 100 ml of the mobile phase, dilute to 200.0 ml with the mobile phase and filter if necessary.

Reference Solution. A 0.0125 per cent w/v solution of *paracetamol RS* in the mobile phase.

Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: *0.01 M sodium butanesulphonate* in a mixture of 85 volumes of *water*, 15 volumes of *methanol* and 0.4 volume of *formic acid*,
- flow rate. 2 ml per minute,

- spectrophotometer set at 243 nm,
- injection volume. 20 µl.

Determine the weight per ml (2.4.29) of the syrup and calculate the percentage content of $C_8H_9NO_2$, weight in volume.

Storage. Store protected from light and moisture.

Paracetamol Tablets

Acetaminophen Tablets

Paracetamol Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of paracetamol, $C_8H_9NO_2$.

Usual strengths. 300 mg; 500 mg.

Identification

Extract a quantity of the powdered tablets containing 0.5 g of Paracetamol with 20 ml of *acetone*, filter, evaporate the filtrate to dryness and dry at 105°. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *paracetamol RS* or with the reference spectrum of paracetamol.

B. Boil 0.1 g in 1 ml of *hydrochloric acid* for 3 minutes, add 10 ml of *water* and cool; no precipitate is produced. Add 0.05 ml of *0.0167 M potassium dichromate*; a violet colour develops which does not turn red.

Tests

4-Aminophenol. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the powdered tablets containing 1 g of Paracetamol with 15 ml of *methanol*, dilute to 100 ml with *water* and filter.

Reference solution. A 0.001 per cent w/v solution of *4-aminophenol* in *methanol (15 per cent)*.

Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: *0.01 M sodium butanesulphonate* in a mixture of 85 volumes of *water*, 15 volumes of *methanol* and 0.4 volume of *formic acid*,
- flow rate. 2 ml per minute,
- spectrophotometer set at 272 nm,
- injection volume. 20 µl.

In the chromatogram obtained with the test solution the area of any peak corresponding to 4-aminophenol is not greater than the area of the peak in the chromatogram obtained with the reference solution. In the chromatogram obtained with the test solution peaks with a long retention times may occur due to excipients.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing about 0.2 g of Paracetamol in 10.0 ml of the mobile phase, filter.

Reference solution (a). Dilute 1 ml of the test solution to 20 ml with the mobile phase. Dilute 1 ml of this solution to 20 ml with the mobile phase.

Reference solution (b). A solution containing 0.002 per cent w/v each of *4-aminophenol* and *paracetamol RS* in the mobile phase.

Reference solution (c).) A 0.00002 per cent w/v solution of *4-chloroacetanilide* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as Zorbax Rx C8),
- column temperature. 35 °,
- mobile phase: a mixture of 25 volumes of *methanol* containing 1.15 g of *tetrabutylammonium hydroxide solution* (40 per cent w/v), with 37.5 volumes of *0.05 M disodium hydrogen orthophosphate* and 37.5 volumes of *0.05 M sodium dihydrogen orthophosphate,*
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume. 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 4.0.

Inject the test solution and reference solution (a), (b) and (c). Run the chromatogram 12 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of peak corresponding to 4-aminophenol is not more than the area of the corresponding peak in reference solution (b) (0.1 per cent), the area of peak corresponding to 4- chloroacetanilide is not more than the area of the principal peak in reference solution (c) (10 ppm) and the area of any other secondary peak is not more than the area of the principal peak obtained with reference solution (a) (0.25 per cent).

Dissolution (2.5.2).

Apparatus. No 1
Medium. 900 ml of *phosphate buffer pH 5.8*
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter and dilute a suitable volume of the filtrate with the same solvent. Measure the absorbance of the resulting solution at the maximum at

about 243 nm (2.4.7). Similarly measure the absorbance of a solution of known concentration of *paracetamol RS*. Calculate the content of $C_8H_9NO_2$.

D. Not less than 80 per cent of the stated amount of $C_8H_9NO_2$.

Other tests. Complies with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 0.15 g of Paracetamol, add 50 ml of *0.1 M sodium hydroxide*, dilute with 100 ml of *water*, shake for 15 minutes and add sufficient *water* to produce 200.0 ml. Mix, filter and dilute 10.0 ml of the filtrate to 100.0 ml with *water*. To 10.0 ml of the resulting solution add 10 ml of *0.1 M sodium hydroxide*, dilute to 100.0 ml with *water* and mix. Measure the absorbance of the resulting solution at the maximum at about 257 nm (2.4.7). Calculate the content of $C_8H_9NO_2$ taking 715 as the specific absorbance at 257 nm.

Storage. Store protected from light and moisture.

Hard Paraffin

Hard Paraffin is a purified mixture of solid hydrocarbons obtained from petroleum or from shale oil.

Category. Pharmaceutical aid (stiffening agent).

Description. A white or colourless, translucent mass, frequently showing a crystalline structure; odourless even when freshly cut; slightly greasy to the touch. Burns with a luminous flame. When melted, the liquid is free from fluorescence by daylight.

Tests

Acidity or alkalinity. To 10.0 g add 20 ml of boiling *water*, heat in a water-bath for 5 minutes, shake vigorously for 1 minute, cool, allow to separate and filter the aqueous layer. To 10 ml of the filtrate add 0.1 ml of *phenolphthalein solution*. The solution is colourless and not more than 0.1 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution to pink.

Congealing range (2.4.10). 50° to 65°.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Liquid Paraffin

White Mineral Oil; Liquid Petrolatum

Liquid Paraffin is a purified mixture of liquid hydrocarbons obtained from petroleum to which not more than 10 ppm of tocopherol or of butylated hydroxytoluene may be added.

Category. Laxative; faecal softener.

Dose. 10 to 30 ml.

Description. A transparent, colourless, oily liquid, free from fluorescence by daylight; odourless or almost odourless.

Tests

Weight per ml (2.4.29). 0.860 g to 0.904 g.

Dynamic viscosity (2.4.28). 110 mPas to 230 mPas, determined at 20° ±1° by method B or **Viscosity** (2.4.28). 10 cps to 40 cps, determined at 30° ±1° by method C using LV1 spindle at 30 rpm.

Acidity or alkalinity. To 10.0 g add 20 ml of boiling *water*, heat in a water-bath for 5 minutes, shake vigorously for 1 minute, cool, allow to separate and filter the aqueous layer. To 10 ml of the filtrate add 0.1 ml of *phenolphthalein solution*. The solution is colourless and not more than 0.1 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution to pink.

Light absorption. When examined in the range 240 nm to 280 nm (2.4.7), a 2.0 per cent w/v solution in *2,2,4-trimethylpentane* shows an absorption of not more than 0.1.

Readily carbonisable substances. Place 5 ml in a dry, heat-resistant glass-stoppered test-tube (125 mm x 18 mm) previously rinsed with chromic acid solution, then with *water* and dried. Add 5 ml of *nitrogen-free sulphuric acid* (containing 94.5 per cent to 95.5 per cent w/w of H_2SO_4), insert the stopper and shake as vigorously as possible in the longitudinal direction of the tube for 5 seconds. Loosen the stopper, immediately place the tube in a bath of boiling *water*, supporting it so as to prevent contact of the tube with the bottom or side of the bath and heat for 10 minutes. At the end of the second, fourth, sixth, and eighth minutes, remove the tube from the bath and shake as vigorously as possible in the longitudinal direction of the tube for 5 seconds. At the end of 10 minutes from the time the tube was placed in the bath remove the tube and allow to stand for 10 minutes. The lower acid layer is not more intensely coloured than a mixture of 3 ml of FCS, 1.5 ml of CCS and 0.5 ml of CSS (2.4.1), overlaid with 5 ml of liquid paraffin. If the sulphuric acid remains dispersed in the molten paraffin, the colour of the emulsion is not darker than that of the standard mixture when shaken vigorously.

Solid paraffins. Place a suitable quantity, previously dried by heating at 100° for 2 hours and cooled in a desiccator over sulphuric acid, in a glass cylindrical vessel having an internal diameter of approximately 25 mm. Close the vessel and immerse in a mixture of ice and *water*; after 4 hours the liquid is sufficiently clear that a black line, 0.5 mm in width, held vertically behind the vessel is easily seen.

Sulphur compounds. Mix 4 ml with 2 ml of *ethanol (95 per cent)*, and 2 drops of a clear, saturated solution of *lead monoxide* in *sodium hydroxide solution* and heat at 70° for

10 minutes with frequent shaking; the mixture remains colourless.

Storage. Store protected from light.

Light Liquid Paraffin

Light Mineral Oil; Light Liquid Petrolatum

Light Liquid Paraffin is a purified mixture of liquid saturated hydrocarbons obtained from petroleum. It may contain a suitable stabiliser.

Category. Pharmaceutical aid (vehicle).

Description. A transparent, colourless, oily liquid, free from fluorescence by daylight; almost odourless when cold.

Tests

Weight per ml (2.4.29). 0.820 g to 0.880 g.

Dynamic viscosity (2.4.28). 25 mPas to 80 mPas, determined at 20° ±1° by method B or **Viscosity** (2.4.28). 10 cps to 40 cps, determined at 30° ±1° by method C using LV1 spindle at 30 rpm.

Acidity or alkalinity. To 10.0 g add 20 ml of boiling *water*, heat in a water-bath for 5 minutes, shake vigorously for 1 minute, cool, allow to separate and filter the aqueous layer. To 10 ml of the filtrate add 0.1 ml of *phenolphthalein solution*. The solution is colourless and not more than 0.1 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution to pink.

Light absorption. When examined in the range 240 nm to 280 nm (2.4.7), a 2.0 per cent w/v solution in *2,2,4-trimethylpentane* shows an absorption of not more than 0.1.

Readily carbonisable substances. Place 5 ml in a dry, heat-resistant glass-stoppered test-tube (125 mm x 18 mm) previously rinsed with chromic acid solution, then with *water* and dried. Add 5 ml of *nitrogen-free sulphuric acid* (containing 94.5 per cent to 95.5 per cent w/w of H_2SO_4), insert the stopper and shake as vigorously as possible in the longitudinal direction of the tube for 5 seconds. Loosen the stopper, immediately place the tube in a bath of boiling *water*, supporting it so as to prevent contact of the tube with the bottom or side of the bath and heat for 10 minutes. At the end of the second, fourth, sixth, and eighth minutes, remove the tube from the bath and shake as vigorously ssas possible in the longitudinal direction of the tube for 5 seconds. At the end of 10 minutes from the time the tube was placed in the bath remove the tube and allow to stand for 10 minutes. The lower acid layer is not more intensely coloured than a mixture of 3 ml of FCS, 1.5 ml of CCS and 0.5 ml of CSS (2.4.1), overlaid with 5 ml of liquid paraffin. If the sulphuric acid remains dispersed in the molten paraffin, the colour of the emulsion is not darker than that of the standard mixture when shaken vigorously.

Solid paraffins. Place a suitable quantity, previously dried by heating at 100° for 2 hours and cooled in a desiccator over sulphuric acid, in a glass cylindrical vessel having an internal diameter of approximately 25 mm. Close the vessel and immerse in a mixture of ice and water; after 4 hours the liquid is sufficiently clear that a black line, 0.5 mm in width, held vertically behind the vessel is easily seen.

Sulphur compounds. Mix 4 ml with 2 ml of *ethanol (95 per cent)*, and 2 drops of a clear, saturated solution of *lead monoxide* in *sodium hydroxide solution* and heat at 70° for 10 minutes with frequent shaking; the mixture remains colourless.

Storage. Store protected from light.

Liquid Paraffin Emulsion

Liquid Paraffin Oral Emulsion

Liquid Paraffin Emulsion is an oral emulsion of Liquid Paraffin in Purified Water.

Liquid Paraffin Emulsion contains not less than 44.0 per cent and not more than 49.0 per cent w/w of liquid paraffin.

Category. Laxative; faecal softener.

Dose. 10 to 30 ml.

Tests

Other tests. Complies with the tests stated under Oral Liquids.

Assay. Weigh accurately about 5.0 g, add 10 ml of *water*, extract with two quantities, each of 40 ml, of a mixture of 2 volumes of *ethanol (95 per cent)*, 3 volumes of *light petroleum (40° to 60°)* and 3 volumes of *ether* and then with 30 ml of a mixture of equal volumes of *light petroleum (40° to 60°)* and *ether*. Wash the combined extracts with 15 ml of *0.5 M sodium hydroxide* and then with 15 ml of *water*, evaporate the solvent, add 5 ml of *acetone* and evaporate again. Repeat the addition and evaporation of acetone until the residue is free from *water*, dry at 105° for 15 minutes and weigh.

Storage. Store protected from moisture.

White Soft Paraffin

White Petroleum Jelly

White Soft Paraffin is a purified, semi-solid mixture of hydrocarbons obtained from petroleum and bleached.

Category. Pharmaceutical aid (ointment base).

Description. A white, translucent, soft unctuous mass, retaining these characteristics on storage and when melted and allowed to cool without stirring; not more than slightly fluorescent by daylight, even melted; odourless when rubbed on the skin.

Tests

Melting range (2.4.21). 38° to 56°, determined by Method IV.

Acidity or alkalinity. To 10.0 g add 20 ml of boiling *water*, heat in a water-bath for 5 minutes, shake vigorously for 1 minute, cool, allow to separate and filter the aqueous layer. To 10 ml of the filtrate add 0.1 ml of *phenolphthalein solution*. The solution is colourless and not more than 0.1 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution to pink.

Light absorption (2.4.7). Absorbance of a 0.05 per cent w/v solution in *2,2,4-trimethylpentane* at about 290 nm, not more than 0.5.

Fixed oils, fats and resin. Digest 10 g with 50 ml of *sodium hydroxide solution* at 100° for 30 minutes and allow the aqueous layer to separate. On acidifying the aqueous layer with *dilute sulphuric acid*, no precipitate or oily matter is produced.

Foreign organic matter. Volatilises when heated, without emitting an acrid odour.

Consistency. 100 to 300, determined by the following method.

Apparatus. The apparatus is essentially in agreement with IS 4887:1980 and comprises a penetrometer fitted with a polished cone-shaped metal plunger weighing 150 g having a detachable steel tip of the following dimensions. The tip of the cone has an angle of 30°, the point being truncated to a diameter of 0.38 ± 0.08 mm, the base of the tip is 8.38 ± 0.13 mm in diameter and the length of the tip is 15 ± 0.25 mm. The remaining portion of the cone has an angle of 90°, is 28 to 29 mm in height, and has a maximum diameter of 65.1 mm at the base. The containers of the test are flat-bottomed metal or glass cylinders that are 102 ± 6 mm in diameter and not less than 60 mm in height.

Procedure. Melt a sufficient quantity at a temperature below 85° and pour into one or more of the containers filling to within 6 mm of the rim. Cool to 25° ± 2.5° over a period of not less than 16 hours, protected from drafts. Two hours before the test, place the containers in a water-bath at 25° ± 0.5°. If the room temperature is below 23.5° or above 26.5°, adjust the temperature of the cone to 25° ± 0.5° by placing it in a water-bath.

Without disturbing the surface of the substance under examination, place the container on the penetrometer table, and lower the cone until the tip just touches the top surface of the test substance at a spot 25 mm to 38 mm from the edge of the container. Adjust the zero setting and quickly release the plunger, then hold it free for 5 seconds. Secure the plunger and read the total penetration from the scale. Make three or more trials, each so spaced that there is no overlapping of the areas of penetration. Where the penetration exceeds 20 mm, use a separate container of the test substance for each trial. Read the penetration to the nearest 0.1 mm. Calculate the average of the three or more readings and conduct further trials to a total of 10 if the individual results differ from the average by more than ± 3 per cent. The final average of the trials is not less than 10.0 mm and not more than 30.0 mm indicating a consistency value between 100 and 300.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Storage. Store protected from light and moisture.

Yellow Soft Paraffin

Yellow Petroleum Jelly

Yellow Soft Paraffin is a purified, semi-solid mixture of hydrocarbons obtained from petroleum.

Category. Pharmaceutical aid (ointment base).

Description. A pale yellow to yellow, translucent, soft unctuous mass, retaining these characteristics on storage and when melted and allowed to cool without stirring; not more than slightly fluorescent by daylight, even melted; odourless when rubbed on the skin.

Tests

Melting range (2.4.21). 38° to 56°, determined by Method IV.

Light absorption (2.4.7). Absorbance of a 0.05 per cent w/v solution in *2,2,4-trimethylpentane* at about 290 nm, not more than 0.75.

Acidity or alkalinity. To 10.0 g add 20 ml of boiling *water*, heat in a water-bath for 5 minutes, shake vigorously for 1 minute, cool, allow to separate and filter the aqueous layer. To 10 ml of the filtrate add 0.1 ml of *phenolphthalein solution*. The solution is colourless and not more than 0.1 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution to pink.

Fixed oils, fats and resin. Digest 10 g with 50 ml of *sodium hydroxide solution* at 100° for 30 minutes and allow the aqueous layer to separate. On acidifying the aqueous layer with *dilute sulphuric acid*, no precipitate or oily matter is produced.

Foreign organic matter. Volatilises when heated, without emitting an acrid odour.

Consistency. 100 to 300, determined by the following method.

Apparatus. The apparatus is essentially in agreement with IS 4887.1980 and comprises a penetrometer fitted with a polished cone-shaped metal plunger weighing 150 g having a detachable steel tip of the following dimensions. The tip of the cone has an angle of 30°, the point being truncated to a diameter of 0.38 ± 0.08 mm, the base of the tip is 8.38 ± 0.13 mm in diameter and the length of the tip is 15 ± 0.25 mm. The remaining portion of the cone has an angle of 90°, is 28 to 29 mm in height, and has a maximum diameter of 65.1 mm at the base. The containers of the test are flat-bottomed metal or glass cylinders that are 102 ± 6 mm in diameter and not less than 60 mm in height.

Procedure. Melt a sufficient quantity at a temperature below 85° and pour into one or more of the containers filling to within 6 mm of the rim. Cool to 25° ± 2.5° over a period of not less than 16 hours, protected from drafts. Two hours before the test, place the containers in a water-bath at 25° ± 0.5°. If the room temperature is below 23.5° or above 26.5°, adjust the temperature of the cone to 25° ± 0.5° by placing it in a water-bath.

Without disturbing the surface of the substance under examination, place the container on the penetrometer table, and lower the cone until the tip just touches the top surface of the test substance at a spot 25 mm to 38 mm from the edge of the container. Adjust the zero setting and quickly release the plunger, then hold it free for 5 seconds. Secure the plunger and read the total penetration from the scale. Make three or more trials, each so spaced that there is no overlapping of the areas of penetration. Where the penetration exceeds 20 mm, use a separate container of the test substance for each trial. Read the penetration to the nearest 0.1 mm. Calculate the average of the three or more readings and conduct further trials to a total of 10 if the individual results differ from the average by more than ± 3 per cent. The final average of the trials is not less than 10.0 mm and not more than 30.0 mm indicating a consistency value between 100 and 300.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Storage. Store protected from light and moisture.

Paraffin Ointment

Category. Pharmaceutical aid (ointment basis).

White Beeswax	20 g
Hard Paraffin	30 g
Cetostearyl Alcohol	50 g
White Soft Paraffin*	900 g

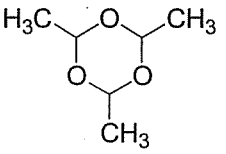
*May be replaced by Yellow Soft Paraffin if other medicaments to be incorporated are coloured.

Mix the ingredients, heat gently with stirring until homogeneous and stir until cold.

Tests

Paraffin Ointment complies with the tests stated under Ointments.

Paraldehyde



$C_6H_{12}O_3$ Mol. Wt. 132.7

Paraldehyde is 2,4,6-trimethyl-1,3,5-trioxane, the cyclic trimer of acetaldehyde. It may contain a suitable amount of antioxidant.

Category. Anticonvulsant in status epilepticus; hypnotic; sedative.

Dose. By deep intramuscular injection, as a single dose, 5 to 10 ml; by rectal injection, 5 to 10 ml, suitably diluted with physiological saline.

Description. A colourless or slightly yellow, transparent liquid; odour, strong and characteristic. Solidifies at low temperature to form a crystalline mass.

Identification

A. Heat 5 ml with 0.1 ml of *1 M sulphuric acid*; acetaldehyde, recognisable by its odour, is evolved.

B. To 5 ml of a 10 per cent v/v solution add 5 ml of *ammoniacal silver nitrate solution* in a test-tube and heat on a water-bath; metallic silver is deposited as a mirror on the sides of the tube.

C. A 10 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), but becomes turbid on warming.

Tests

Congealing range (2.4.10). 10° to 13°.

Distillation range (2.4.8). Not more than 10 per cent distils below 123° and not less than 95 per cent distils below 126°.

Refractive index (2.4.27). 1.403 to 1.406.

Relative density (2.4.29). 0.991 to 0.996.

Acetaldehyde. Shake 5 ml with a mixture of 5 ml of *ethanol (60 per cent)*, 5 ml of *hydroxylamine hydrochloride reagent in ethanol (60 per cent)* and 2 drops of *methyl orange solution* and titrate with *0.5 M sodium hydroxide* to full yellow colour; not more than 0.8 ml of *0.5 M sodium hydroxide* is required.

Acidity. Mix 5 ml with 45 ml of *carbon dioxide-free water* and titrate with *0.1 M sodium hydroxide* using *phenolphthalein solution* as indicator; not more than 1.5 ml is required.

Chlorides. To 5 ml of a 1 per cent v/v solution add one drop of *nitric acid* and three drops of *silver nitrate solution*; no opalescence is produced immediately.

Sulphates. To 5 ml of a 1 per cent v/v solution add one drop of *hydrochloric acid* and three drops of *barium chloride solution*; no turbidity is produced.

Peroxides. In a stoppered vessel, dissolve 5 ml in sufficient of recently boiled and cooled *water* to produce 50 ml, add 5 ml of *dilute sulphuric acid* and 10 ml of *potassium iodide solution*. Close the flask and set aside in the dark for 15 minutes. Titrate with *0.1 M sodium thiosulphate* using *starch solution* as indicator; set aside for 5 minutes and, if necessary, complete the titration. Not more than 2.0 ml of *0.1 M sodium thiosulphate* is required.

Non-volatile matter. Heat 5 ml in a small dish on a water-bath and dry at 105° for 1 hour; the residue weighs not more than 3 mg (0.06 per cent w/v).

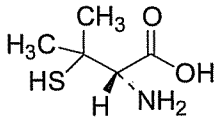
Storage. Store protected from moisture, in complete darkness and at a temperature of 8° to 15°. If solidified, the whole of the contents of the container should be liquified by warming before use.

NOTE — Do not use Paraldehyde if it has a brownish colour or an odour of acetic acid. Avoid contact with rubber and plastics.

Labelling. The label states (1) the nature and the proportion of any antioxidant added; (2) that it may decompose on standing to form potentially harmful substances.

Penicillamine

D-Penicillamine



$C_5H_{11}NO_2S$ Mol. Wt. 149.2

Penicillamine is 3-mercapto-D-valine.

Penicillamine contains not less than 98.0 per cent and not more than 101.0 per cent of $C_5H_{11}NO_2S$, calculated on the dried basis.

Category. Chelating agent in copper and lead poisoning; antirheumatoid arthritic.

Dose. In poisoning, 500 mg to 2 g daily, in divided doses or in accordance with the needs of the patient. In rheumatoid arthritis, initial dose, 125 to 250 mg daily before food, increased gradually every 4 to 12 weeks until remission occurs; usual maintenance dose, 500 to 750 mg daily.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if test B, C and D carried out. Test D may be omitted if test A, B and C are carried out.

A. Determine by thin layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 40 volumes of *1-butanol*, 10 volumes of *glacial acetic acid* and 10 volumes of *water*.

Test solution. Dissolve 0.25 g of the substance under examination in 100 ml of *water*.

Reference solution. A 0.25 per cent w/v solution of *penicillamine RS* in *water*.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate at 105° for 5 to 10 minutes and expose to iodine vapour for 5 to 10 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. Dissolve 0.5 g in a mixture of 0.5 ml of *hydrochloric acid* and 4 ml of warm *acetone*, cool in ice and scratch the inside of the tube with a glass rod to initiate crystallisation; a white precipitate is produced. Filter under vacuum, wash the precipitate with *acetone* and dry with suction. A 1 per cent w/v solution of the dried material is dextrorotatory.

C. To 4 ml of a 1 per cent w/v solution add 2 ml of *phosphotungstic acid solution* and heat nearly to boiling; a blue colour is produced.

D. In the test for Penicillamine disulphide, the principal peak in the chromatogram obtained with test solution (b) corresponds to the peak due to penicillamine in the chromatogram obtained with reference solution (a).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *carbon dioxide-free water* (solution A) is clear (2.4.1), and not more intensely coloured than degree 6 of the appropriate range of reference solutions (2.4.1).

pH (2.4.24). 4.5 to 5.5, determined in a 1.0 per cent w/v solution.

Specific optical rotation (2.4.22). –61.0° to –65.0°, determined in a 5.0 per cent w/v solution in *1 M sodium hydroxide*.

Heavy metals (2.3.13). 10 ml of solution A, complies with the limit test for heavy metals, Method D (20 ppm). Use *lead standard solution (2 ppm Pb)* to prepare the standard.

Mercuric salts. Determine by atomic absorption spectrophotometry (2.4.2), using a solution prepared in the following manner. To 1.0 g of the substance under examination add 10 ml of *water* and 0.15 ml of *perchloric acid* and swirl until dissolution is complete. Add 1 ml of *ammonium*

pyrrolidinedithiocarbamate solution that has been washed three times immediately before use, each time with an equal volume of *4-methyl-2-pentanone*. Mix, add 2 ml of *4-methyl-2-pentanone*, shake for 1 minute, dilute to 25 ml with *water*, allow the layers to separate and use the 4-methyl-2-pentanone layer. Measure the absorbance at 254 nm using a mercury hollow-cathode lamp and an air-acetylene flame and setting the zero using a 4-methyl-2-pentanone layer obtained by repeating the procedure described above but omitting the substance under examination. For the standard solution dissolve 0.108 g of *yellow mercuric oxide* in the minimum volume of *2 M hydrochloric acid*, add sufficient *water* to produce 1000.0 ml and treat suitable volumes in the same manner as the solution of the substance under examination (10 ppm).

Penicillamine disulphide. Determine by liquid chromatography (2.4.14).

Test solution (a). Dissolve 40 mg of the substance under examination in 5 ml of the mobile phase, add 1 ml of a 0.0025 per cent w/v solution of *sulphanilamide* (internal standard) in the mobile phase and dilute to 10 ml with the mobile phase.

Test solution (b). Dissolve 40 mg of the substance under examination in the mobile phase and dilute to 10 ml with the same solvent.

Reference solution (a). A 0.4 per cent w/v solution of *penicillamine RS* in the mobile phase.

Reference solution (b). Add 1 ml of test solution (a) to 1 ml of a 0.04 per cent w/v solution of *penicillamine disulphide RS* in the mobile phase and dilute to 10 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 5 mm, packed with octylsilane bonded to porous silica (5 to 10 µm),
- mobile phase: an equal volume of 0.2 per cent w/v solution of *methanesulphonic acid* and 0.01 per cent w/v solution of *disodium edetate*,
- flow rate. 2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume. 20 µl.

In the chromatogram obtained with test solution (a) the ratio of the area of any peak corresponding to penicillamine disulphide to the area of the peak due to the internal standard is not greater than the corresponding ratio in the chromatogram obtained with reference solution (b).

Penicillin. Carry out the following procedure in a penicillin-free atmosphere and with equipment reserved for the test. Sterilise the equipment at 180° for 3 hours and the buffer solutions at 121° for 20 minutes before use.

Liquefy a suitable nutrient medium such as that described below and inoculate at a suitable temperature with a culture of *Micrococcus flavus* (ATCC 9341) to give 5 x 10^4 micro-organisms per ml or a quantity necessary to obtain the required sensitivity and formation of clearly defined inhibition zones of suitable diameter. Immediately pour the inoculated medium into five Petri dishes (10 cm in diameter) to give uniform layers 2 to 5 mm in depth. Alternatively, the medium may consist of two layers, only the upper layer being inoculated. Store the dishes so that no appreciable growth or death of micro-organisms occurs before use and so that the surface of the medium is dry at the time of use. In each dish, place five stainless steel hollow cylinders (6 mm in diameter) on the surface of the medium evenly spaced on a circle with a radius of about 25 mm and concentric with the dish. For each dish, place in separate cylinders 0.15 ml of each of the following five solutions.

For solution (1) dissolve 1.0 g of the substance under examination in 8 ml of *phosphate buffer pH 2.5*, add 8 ml of *ether* and shake vigorously for 1 minute. Repeat the extraction and combine the ether layers. Add 8 ml of *phosphate buffer pH 2.5*, shake for 1 minute, allow to settle and separate the ether layer quantitatively, taking care to eliminate the aqueous phase completely. *(Penicillin is unstable at pH 2.5; carry out the operations at this pH within 6 to 7 minutes)*. Add 8 ml of *phosphate buffer pH 6.0*, shake for 5 minutes, allow to settle, separate the aqueous layer and check that the pH is 6.0. For solution (2) add 20 µl of *penicillinase solution* to 2 ml of solution (1) and incubate at 37° for 1 hour. For solution (3) dissolve 5 mg of *benzylpenicillin sodium* in 500 ml of phosphate buffer pH 6.0 and dilute 0.25 ml of this solution to 200 ml with *phosphate buffer pH 2.5*. Carry out the extraction procedure described under solution (1) using 8 ml of this solution and beginning at the words "add 8 ml of *ether*...". For solution (4) add 20 ml of *penicillinase solution* to 2 ml of solution (3) and incubate at 37° for 1 hour. Prepare solution (5) in the same manner as solution (1) but omitting the substance under examination.

Maintain the dishes at 30° for at least 24 hours. Measure the diameters of the zones of inhibition to within 0.1 mm. The test is not valid unless solution (3) gives a clear zone of inhibition and solutions (4) and (5) give no zones of inhibition. If solution (1) gives a zone of inhibition it is caused by penicillin provided solution (2) gives no zone of inhibition. If this is the case, the average diameter of the zones of inhibition given by solution (1) for the five Petri dishes is less than that given by solution (3) (0.1 ppm).

Nutrient medium

Peptone	5 g
Yeast extract	1.5 g
Meat extract	1.5 g
Sodium chloride	3.5 g
Agar	15 g
Distilled water	1000 ml
Adjust the pH to	6.0

Penillic acid. Absorbance of a 0.2 per cent w/v solution at about 268 nm, not more than 0.07 (2.4.7) (about 0.5 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 60° over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa.

Assay. Dissolve 0.1 g in 30 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01492 g of $C_5H_{11}NO_2S$.

Storage. Store protected from moisture.

Penicillamine Tablets

D-Penicillamine Tablets

Penicillamine Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of penicillamine, $C_5H_{11}NO_2S$. The tablets are coated.

Usual strengths. 50 mg; 125 mg; 250 mg.

Identification

A. Shake a quantity of the powdered tablets containing 20 mg of Penicillamine with 4 ml of *water* and filter. Add to the filtrate 2 ml of *phosphotungstic acid solution* and allow to stand for 5 minutes; a blue colour is produced.

B. Dissolve a quantity of the powdered tablets containing 10 mg of Penicillamine in 5 ml of *water* and add 0.3 ml of *5 M sodium hydroxide* and 20 mg of *ninhydrin*; an intense blue or violet-blue colour is produced immediately.

Tests

Mercuric salts. Disperse a quantity of the powdered tablets containing 1 g of Penicillamine in 10 ml of *water* in a stoppered flask, add 0.2 ml of *9 M perchloric acid* and swirl to dissolve. Add 1 ml of *ammonium pyrrolidinedithiocarbamate solution*, mix, add 2 ml of *4-methyl-2-pentanone*, shake for 1 minute and add sufficient *water* to produce 25 ml. Determine by atomic absorption spectrophotometry (2.4.2), using a mercury hollow-cathode lamp and an air-acetylene flame and setting the zero using a *4-methyl-2-pentanone* layer obtained by repeating the procedure described above but omitting the substance under examination, measuring at 254 nm. Use *mercury solution AAS*, suitably diluted with *water*, for the standard solutions, adjusted to contain the same concentrations of *9 M perchloric acid, ammonium pyrrolidinedithiocarbamate solution* and *4-methyl-2-pentanone* as the solution under examination (40 ppm).

Penicillamine disulphide. Determine by liquid chromatography (2.4.14).

Test solution. Shake quantity of the powdered tablets containing 40 mg of Penicillamine with 10 ml of the mobile phase, filter and use the filtrate.

Reference solution. A 0.004 per cent w/v solution of *penicillamine disulphide RS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 5 mm, packed with octylsilane bonded to porous silica (5 to 10 µm),
- mobile phase: an equal volume of 0.2 per cent w/v solution of *methanesulphonic acid* and 0.01 per cent w/v solution of *disodium edetate*,
- flow rate. 2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume. 20 µl.

In the chromatogram obtained with the test solution the area of any peak corresponding to penicillamine disulphide is not greater than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

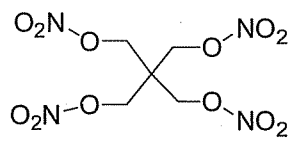
Other tests. Complies with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing 0.1 g of Penicillamine, dissolve as completely as possible in 50 ml of *water* and filter. Add to the filtrate 5 ml of *1 M sodium hydroxide* and 0.2 ml of a 0.1 per cent w/v solution of *dithizone* in *ethanol (95 per cent)* and titrate with *0.02 M mercuric nitrate*.

1 ml of *0.02 M mercuric nitrate* is equivalent to 0.005968 g of $C_5H_{11}NO_2S$.

Storage. Store protected from moisture.

Diluted Pentaerythritol Tetranitrate



$C_5H_8N_4O_{12}$ Mol. Wt. 316.1

Diluted Pentaerythritol Tetranitrate is a dry mixture of 2,2-bis(hydroxymethyl)propane-1,3-diol tetranitrate with Lactose or Mannitol or a mixture of Lactose and Starch or any other suitable inert excipients which permit safe handling.

Diluted Pentaerythritol Tetranitrate contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of pentaerythritol tetranitrate, $C_5H_8N_4O_{12}$.

Category. Antianginal.

Dose. The equivalent of 20 to 60 mg of pentaerythritol tetranitrate, three to four times daily.

Description. A white or almost white, powder; odour, faint and mild.

Identification

A. Transfer a quantity of powder containing 10 mg of pentaerythritol tetranitrate to a medium porosity sintered-glass filter, add 5 ml of dry *acetone* and collect the filtrate. Repeat with two further quantities, each of 5 ml, of dry *acetone* and evaporate the combined filtrate at a temperature not exceeding 60°, with the aid of a gentle current of air, and dry the residue at 60° for 4 hours; the residue melts at 138° to 142° (2.4.21).

B. Suspend 10 mg of the residue obtained in test A in a mixture of 2 ml of *sulphuric acid* and 1 ml of *water;* cool and carefully overlay with 3 ml of *ferrous sulphate solution*; a reddish brown colour is produced at the interface of the two liquids.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 20 volumes of *ethyl acetate* and 80 volumes of *toluene*.

Test solution. Dissolve a quantity of the substance under examination containing about 10 mg of Pentaerythritol Tetranitrate in 10 ml of *ethanol (95 per cent)*, filter.

Reference solution. Shake a quantity of *diluted pentaerythritol tetranitrate RS* containing about 10 mg of Pentaerythritol Tetranitrate with 10 ml of *ethanol (95 per cent)*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 8 cm. Dry the plate in air and examine at 254 nm, The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Impurity A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 15 volumes of *glacial acetic acid*, 30 volumes of *acetone* and 60 volumes of *toluene*.

Test solution. Dissolve about 0.1 g of the substance under examination in 5.0 ml of *ethanol (95 per cent)*, filter.

Reference solution. Dissolve about 10 mg of *potassium nitrate* in 1 ml of *water* and dilute to 100 ml with *ethanol (95 per cent)*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 8 cm. Dry the plate in air and spray with freshly prepared *potassium iodide* and *starch solution* and examine at 254 nm. The spot due to nitrate in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent, calculated as potassium nitrate).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution (a). Shake about 25 mg of the substance under examination in 20 ml of the mobile phase for 15 minutes and dilute to 25.0 ml with the mobile phase, filter.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve a quantity of *diluted pentaerythritol tetranitrate RS* containing about 25 mg of Pentaerythritol Tetranitrate in 20 ml of the mobile phase, sonicate for 15 minutes and dilute to 25.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with the mobile phase.

Reference solution (c). Dilute 0.3 ml of reference solution (b) to 10.0 ml with the mobile phase.

Reference solution (d). Dilute 200 µl of *glyceryl trinitrate solution RS* to 25.0 ml with the mobile phase.

Reference solution (e). To 1 ml of reference solution (b), add 1 ml of reference solution (d) and dilute to 10.0 ml with the mobile phase.

Reference solution (f). Dilute 1.0 ml of reference solution (a) to 20.0 ml with the mobile phase. Dilute 0.5 ml of this solution to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of *water* and 65 volumes of *acetonitrile*,
- flow rate. 1.4 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume. 20 µl.

Inject reference solution (e). The test is not valid unless the resolution between the peaks due to glyceryl trinitrate and pentaerythritol tetranitrate is not less than 3.0. The relative retention time with reference to pentaerythritol tetranitrate for pentaerythritol tetranitrate impurity B is about 0.7 and for pentaerythritol tetranitrate impurity C is about 0.3.

Inject test solution (a), reference solution (c) and (f). Run the chromatogram 5 times the retention time of the principal peak. In the chromatogram obtained with test solution (a) the area of the peak due to pentaerythritol tetranitrate impurity C is not more than the area of the principal peak in the chromatogram

obtained with reference solution (c) (0.3 per cent), the area of any other secondary peak is not more than not more than twice the area of the principal peak in the chromatogram obtained with reference solution (f) (0.1 per cent). The sum of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (0.6 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (f) (0.05 per cent).

Heavy metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Assay. Determine by liquid chromatography (2.4.14), as described in the test for Related substances.

Inject test solution (b) and reference solution (b).

Calculate the content of $C_5H_8N_4O_{12}$.

Storage. Store protected from light and moisture.

NOTE — Undiluted pentaerythritol tetranitrate is a powerful explosive. It can be exploded with percussion or excessive heat. Great care and appropriate precautions should be taken in handling and only exceedingly small amounts should be isolated.

Labelling. The label states the percentage content of pentaerythritol tetranitrate.

Pentaerythritol Tetranitrate Tablets

Pentaerythritol Tetranitrate Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of pentaerythritol tetranitrate, $C_5H_8N_4O_{12}$.

Usual strengths. 10 mg; 30 mg.

Identification

A. Transfer a quantity of powder containing 10 mg of pentaerythritol tetranitrate to a medium porosity sintered-glass filter, add 5 ml of dry *acetone* and collect the filtrate. Repeat with two further quantities, each of 5 ml, of dry *acetone* and evaporate the combined filtrate at a temperature not exceeding 60°, with the aid of a gentle current of air, and dry the residue at 60° for 4 hours; the residue melts at 138° to 142° (2.4.21).

Tests

Uniformity of content. *(For tablets containing 10 mg or less)* — Comply with the test stated under Tablets.

Crush one tablet and transfer to a 50-ml volumetric flask with the aid of 15 ml of *acetone*. Add sufficient *acetone* to produce 25 ml, heat the mixture on a water-bath at a temperature not exceeding 60° and boil gently, with occasional swirling, for 5 minutes. Cool, dilute to volume with *acetone* and mix. Transfer a portion of the mixture to a glass-stoppered centrifuge tube and centrifuge at 1500 rpm for 5 minutes. Transfer 2.5 ml of the supernatant solution to a 100-ml volumetric flask and evaporate at 35° with the aid of a current of air to dryness. To the residue add 1.0 ml of *glacial acetic acid* and swirl to dissolve. Add 2 ml of *phenoldisulphonic acid solution*, mix and allow to stand for 5 minutes. Add 25 ml of *water* and 10 ml of *strong ammonia solution*, cool, dilute to volume with *water* and mix. Measure the absorbance of the resulting solution at the maximum at about 409 nm (2.4.7), using *water* as the blank.

Weigh accurately 0.130 g of *potassium nitrate*, previously dried at 105° for 4 hours, dissolve in 3 ml of *water*, dilute with sufficient *glacial acetic acid* to produce 200.0 ml and mix well. Using 1.0 ml of this solution repeat the procedure beginning at the words "Add 2 ml of *phenoldisulphonic acid solution*,.....". Calculate the content of $C_5H_8N_4O_{12}$ in the tablet.

1 ml of the potassium nitrate solution is equivalent to 0.000503 g of $C_5H_8N_4O_{12}$.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 50 mg of pentaerythritol tetranitrate and transfer to a 100-ml volumetric flask with the aid of about 30 ml of *acetone*. Add sufficient *acetone* to produce 50 ml and warm on a water-bath at a temperature not exceeding 60° and boil gently, with occasional swirling, for 5 minutes. Cool, dilute to volume with *acetone* and mix. Transfer a portion of the mixture to a glass-stoppered centrifuge tube and centrifuge at 1500 rpm for 5 minutes. Transfer 1.0 ml of the supernatant solution to a 100-ml volumetric flask and evaporate at 35° with the aid of a current of air to dryness. To the residue add 1.0 ml of *glacial acetic acid* and swirl to dissolve. Add 2 ml of *phenoldisulphonic acid solution*, mix and allow to stand for 5 minutes. Add 25 ml of *water* and 10 ml of *strong ammonia solution*, cool, dilute to volume with *water* and mix. Measure the absorbance of the resulting solution at the maximum at about 409 nm (2.4.7), using *water* as the blank.

Weigh accurately 0.13 g of *potassium nitrate*, previously dried at 105° for 4 hours, dissolve in 3 ml of *water*, dilute with sufficient *glacial acetic acid* to produce 200.0 ml and mix well. Using 1.0 ml of this solution repeat the procedure beginning at the words "Add 2 ml of *phenoldisulphonic acid solution*,.....".

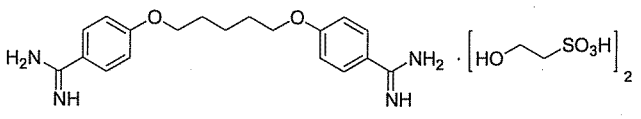
Calculate the content of $C_5H_8N_4O_{12}$ from the values of the absorbances so obtained.

1 ml of the potassium nitrate solution is equivalent to 0.000503 g of $C_5H_8N_4O_{12}$.

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of the equivalent amount of pentaerythritol tetranitrate.

Pentamidine Isethionate



$C_{19}H_{24}N_4O_2,2C_2H_6O_4S$ Mol. Wt. 592.7

Pentamidine Isethionate is 4,4′ -[pentane-1,5-diylbis(oxy)] bisbenzenecarboximidamide di(2-hydroxyethanesulphonate).

Pentamidine Isethionate contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{19}H_{24}N_4O_2$, $2C_2H_6O_4S$, calculated on the dried basis.

Category. Antiprotozoal.

Dose. By intramuscular injection, 3 to 4 mg per kg body weight daily for 10 days, maximum 200 mg.

Description. A white or almost white powder or crystals; odourless or almost odourless; hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pentamidine isethionate RS* or with the reference spectrum of pentamidine isethionate.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *0.01 M hydrochloric acid* shows an absorption maximum only at about 262 nm; absorbance at about 262 nm, about 0.46).

C. To 10 ml of a 0.05 per cent w/v solution add 1 ml of a 0.1 per cent w/v solution of *glyoxal sodium bisulphite* and 1 ml of a solution prepared by dissolving 4 g of *boric acid* in a mixture of 27 ml of *1 M sodium hydroxide* and sufficient *water* to produce 100 ml. Heat on a water-bath for 10 minutes; a magenta colour is produced.

Tests

pH (2.4.24). 4.5 to 6.5, determined in a 5.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 0.1 g of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). Dilute 2.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). To 0.1 g in a conical flask, add 40 ml of *water* and glass beads, adjusted to pH 10.5 with dilute *sodium hydroxide solution* and boil under reflux for 20 minutes. Cool and dilute to 50 ml with *water.* Dilute 1.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of *methanol* and 35 volumes of 3 per cent w/v solution of *ammonium acetate*, adjusted to pH 7.5 with *triethylamine*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume. 10 µl.

Inject reference solution (b). The test is not valid unless the resolution between the 2 principal peaks is not less than 2.0.

Inject the test solution and reference solution (a). Run the chromatogram 3.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the sum of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

Ammonium isethionate. To 1.0 g in a test-tube (about 4 cm in diameter) add 10 ml of *water* and 20 ml of *1 M sodium hydroxide*. Immediately attach a bung carrying a splash head and an aspirator tube (about 5 mm in diameter). Connect the splash head to two test-tubes in series, each containing 20 ml of *0.01 M sulphuric acid*. Heat the tube containing the substance under examination in a water-bath at 45° to 50° and, maintaining this temperature, draw a current of air, previously passed through *1 M sulphuric acid*, through the liquids in a series of tubes for 3 hours at such a rate that the bubbles are just too rapid to count. Titrate the combined solutions from the two absorption tubes with *0.02 M sodium hydroxide* using *methyl red-methylene blue solution* as indicator; not less than 36.5 ml of *0.02 M sodium hydroxide* is required.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 4.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.250 g in 50 ml of *dimethylformamide*. Add 0.25 ml of *thymol blue solution* and titrate with *0.1 M tetrabutylammonium hydroxide*, under a current of *nitrogen*, until the colour of the indicator changes to blue. Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.02963 g of $C_{23}H_{36}N_4O_{10}S_2$.

Storage. Store protected from moisture.

Pentamidine Injection

Pentamidine Isethionate Injection

Pentamidine Injection is a sterile material consisting of Pentamidine Isethionate with or without buffering agents and other excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Pentamidine Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of pentamidine isethionate, $C_{19}H_{24}N_4O_2, 2C_2H_6O_4S$.

Usual strength. 200 mg.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pentamidine isethionate RS* or with the reference spectrum of pentamidine isethionate.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *0.01 M hydrochloric acid* shows an absorption maximum only at about 262 nm; absorbance at about 262 nm, about 0.46.

C. To 10 ml of a 0.05 per cent w/v solution add 1 ml of a 0.1 per cent w/v solution of *glyoxal sodium bisulphite* and 1 ml of a solution prepared by dissolving 4 g of *boric acid* in a mixture of 27 ml of *1 M sodium hydroxide* and sufficient *water* to produce 100 ml. Heat on a water-bath for 10 minutes; a magenta colour is produced.

Tests

pH (2.4.24). 4.5 to 6.5, determined in a 5.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with the mobile phase.

Reference solution (b). Dissolve 0.1 g of substance under examination in 40 ml of *water*, adjusted to pH 10.5 with *2 M sodium hydroxide*, heat under a reflux condenser for 20 minutes, cool and dilute to 50 ml with *water*. Dilute 1.0 ml of this solution to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Spherisorb ODS 1),
- mobile phase: a mixture of 130 volumes of *methanol* and 70 volumes of 3 per cent w/v solution of *ammonium acetate*, adjusted to pH 7.5 with *triethylamine*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume. 10 µl.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 2.0.

Inject the test solution and reference solution (a). Run the chromatogram 3.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any secondary peak is not more 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent).

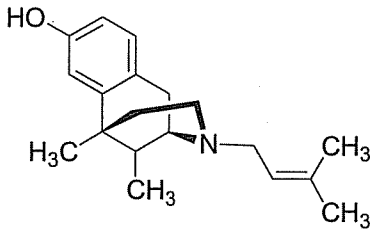
Ammonium isethionate. To 1.0 g in a test-tube (about 4 cm in diameter) add 10 ml of *water* and 20 ml of *1 M sodium hydroxide*. Immediately attach a bung carrying a splash head and an aspirator tube (about 5 mm in diameter). Connect the splash head to two test-tubes in series, each containing 20 ml of *0.01 M sulphuric acid*. Heat the tube containing the substance under examination in a water-bath at 45° to 50° and, maintaining this temperature, draw a current of air, previously passed through *1 M sulphuric acid*, through the liquids in a series of tubes for 3 hours at such a rate that the bubbles are just too rapid to count. Titrate the combined solutions from the two absorption tubes with *0.02 M sodium hydroxide* using *methyl red-methylene blue solution* as indicator; not less than 36.5 ml of *0.02 M sodium hydroxide* is required.

Assay. Dissolve 0.25 g of the mixed contents of 10 containers in 50 ml of *dimethylformamide*. Titrate with *0.1 M tetrabutylammonium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.02963 g of $C_{19}H_{24}N_4O_2, 2C_2H_6O_4S$.

Storage. Store in single dose containers.

Pentazocine



$C_{19}H_{27}NO$ Mol. Wt. 285.4

Pentazocine is (2*RS*,6*RS*,11*RS*)-6,11-dimethyl-3-(3-methylbut-2-enyl)-1,2,3,4,5,6-hexahydro-2,6-methano-3-benzazocin-8-ol.

Pentazocine contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{19}H_{27}NO$, calculated on the dried basis.

Category. Narcotic analgesic.

Dose. By subcutaneous, intramuscular or intravenous injection, 30 to 60 mg every 3 to 4 hours.

Description. A white or pale cream powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pentazocine RS* or with the reference spectrum of pentazocine.

B. To 1 mg in a porcelain crucible add 0.5 ml of a solution of *sulphuric acid* containing 1 per cent w/v solution of *ammonium molybdate*; an intense blue colour is produced which changes to bluish green, green and finally, on standing, yellow.

C. Dissolve 5 mg in 5 ml of *sulphuric acid*, add 0.05 ml of *ferric chloride solution* and mix; a yellow colour is produced which deepens slightly in intensity on warming. On the addition of *0.05 ml of nitric acid* the yellow colour is unchanged.

Tests

Light absorption (2.4.7). To 0.1 g add 20 ml of *water* and 10 ml of *1 M hydrochloric acid*, shake to dissolve and add sufficient *water* to produce 100 ml. Dilute 10 ml to 100 ml with *water*. The absorbance of the resulting solution at the maximum at about 278 nm, 0.67 to 0.71.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254*.

Mobile phase. A mixture of 94 volumes of *chloroform*, 3 volumes of *2-propylamine* and 3 volumes of *methanol*.

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of *chloroform*.

Reference solution (a). A 0.02 per cent w/v solution of the substance under examination in *chloroform*.

Reference solution (b). A 0.01 per cent w/v solution of the substance under examination in *chloroform*.

Reference solution (c). A 0.005 per cent w/v solution of the substance under examination in *chloroform*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. Heat the plate at 105° for 15 minutes, allow to cool, expose to iodine vapour and re-examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a); not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) and not more than four such spots are more intense than the spot in the chromatogram obtained with reference solution (c).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

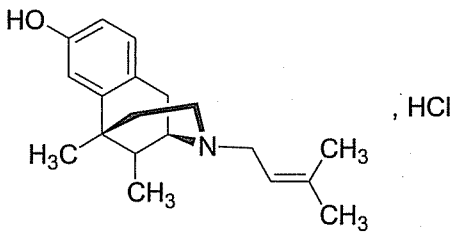
Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 60° at a pressure not exceeding 0.7 kPa for 4 hours.

Assay. Weigh accurately about 0.6 g, dissolve in 50 ml of *anhydrous glacial acetic acid* and titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02854 g of $C_{19}H_{27}NO$.

Storage. Store protected from light and moisture.

Pentazocine Hydrochloride



$C_{19}H_{27}NO,HCl$ Mol. Wt. 321.9

Pentazocine Hydrochloride is (2*RS*,6*RS*,11*RS*)-6,11-dimethyl-3-(3-methylbut-2-enyl)-1,2,3,4,5,6-hexahydro-2,6-methano-3-benzazocin-8-ol hydrochloride.

Pentazocine Hydrochloride contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{19}H_{27}NO,HCl$, calculated on the dried basis.

Category. Narcotic analgesic.

Dose. 25 to 100 mg, every 3 to 4 hours after food.

Description. A white or pale cream-coloured, crystalline powder; odourless. The material exhibits polymorphism.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pentazocine hydrochloride RS* or with the reference spectrum of pentazocine hydrochloride.

B. To 1 mg in a porcelain crucible add 0.5 ml of a solution of *sulphuric acid* containing 1 per cent w/v solution of *ammonium molybdate*; an intense blue colour is produced which changes to bluish green, green and finally, on standing, yellow.

C. Gives reaction A of chlorides (2.3.1).

Tests

pH (2.4.24). 4.0 to 6.0, determined in a 1.0 per cent w/v solution.

Light absorption (2.4.7). Dissolve 0.1 g in 10 ml of *1 M hydrochloric acid* and add sufficient *water* to produce 100 ml; dilute 10 ml to 100 ml with *water*. Absorbance of the resulting solution at the maximum at about 278 nm, 0.59 to 0.63.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254.*

Mobile phase. A mixture of 94 volumes of *chloroform*, 3 volumes of *2-propylamine* and 3 volumes of *methanol.*

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of *chloroform.*

Reference solution (a). A 0.02 per cent w/v solution of the substance under examination in *chloroform.*

Reference solution (b). A 0.01 per cent w/v solution of the substance under examination in *chloroform.*

Reference solution (c). A 0.005 per cent w/v solution of the substance under examination in *chloroform.*

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. Heat the plate at 105° for 15 minutes, allow to cool, expose to iodine vapour and re-examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a); not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) and not more than four such spots are more intense than the spot in the chromatogram obtained with reference solution (c).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 100° at a pressure not exceeding 0.7 kPa.

Assay. Weigh accurately about 0.5 g, dissolve in 50 ml of *anhydrous glacial acetic acid.* Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03219 g of $C_{19}H_{27}NO,HCl$.

Storage. Store protected from light and moisture.

Pentazocine Tablets

Pentazocine Hydrochloride Tablets

Pentazocine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of pentazocine hydrochloride, $C_{19}H_{27}NO,HCl$.

Usual strength. 25 mg.

Identification

A. Shake a quantity of the powdered tablets containing 0.1 g of Pentazocine Hydrochloride with 10 ml of *water*, filter, add 1 ml of *1 M sodium hydroxide* and shake the resulting solution with 20 ml of *chloroform.* Wash the chloroform extract with 5 ml of *water*, dry over *anhydrous sodium sulphate* and filter. Evaporate the chloroform using a rotary evaporator and dry the oily residue at a temperature not exceeding 25° at a pressure of 2 kPa for 1 hour.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pentazocine RS* or with the reference spectrum of pentazocine.

B. To a quantity of the powdered tablets containing 50 mg of Pentazocine Hydrochloride add 70 ml of *water*, shake for 15 minutes, add sufficient *water* to produce 100 ml and filter. To 10 ml of the filtrate add 10 ml of *1 M sodium hydroxide* and sufficient *water* to produce 100 ml. When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows absorption maxima at about 238 nm and 298 nm.

C. Shake a quantity of the powdered tablets containing 25 mg of Pentazocine Hydrochloride with 5 ml of *water* and 0.5 ml of *2 M nitric acid* for 1 minute and filter. The filtrate gives reaction A of chlorides (2.3.1).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254.*

Mobile phase. A mixture of 94 volumes of *chloroform*, 3 volumes of *2-propylamine* and 3 volumes of *methanol.*

Test solution. Shake a quantity of the powdered tablets containing 0.2 g of Pentazocine Hydrochloride with 10 ml of *0.1 M methanolic ammonia* for 10 minutes, centrifuge and use the supernatant liquid.

Reference solution (a). Dilute 1 volume of test solution to 100 volumes with the same solvent.

Reference solution (b). Dilute 1 volume of test solution to 200 volumes with the same solvent.

Reference solution (c). Dilute 1 volume of test solution to 400 volumes with the same solvent.

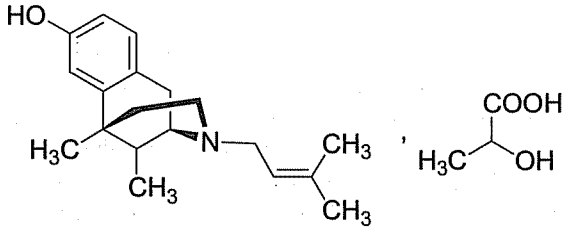
Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. Heat the plate at 105° for 15 minutes, allow to cool, expose to iodine vapour and re-examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a), not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) and not more than four such spots are more intense than the spot in the chromatogram obtained with reference solution (c).

Other tests. Complies with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 25 mg of Pentazocine Hydrochloride, shake with 100 ml of *water* for 15 minutes, add 2.5 ml of *1 M hydrochloric acid* and sufficient *water* to produce 250.0 ml and filter. Measure the absorbance of the filtrate at the maximum at about 278 nm (2.4.7). Calculate the content of $C_{19}H_{27}NO,HCl$ taking 61.2 as the specific absorbance at 278 nm.

Storage. Store protected from light and moisture.

Pentazocine Lactate



$C_{19}H_{27}NO,C_3H_6O_3$ Mol. Wt. 375.4

Pentazocine Lactate is (2*RS*,6*RS*,11*RS*)-6,11-dimethyl-3-(3-methylbut-2-enyl)-1,2,3,4,5,6-hexahydro-2,6-methano-3-benzazocin-8-ol lactate.

Pentazocine Lactate contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{19}H_{27}NO,C_3H_6O_3$, calculated on the dried basis.

Category. Narcotic analgesic.

Dose. By subcutaneous, intramuscular or intravenous injection, the equivalent of 30 to 60 mg of pentazocine every 3 to 4 hours.

Description. A white or pale cream-coloured, crystalline powder; odourless.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pentazocine lactate RS* or with the reference spectrum of pentazocine lactate.

B. To 1 mg in a porcelain crucible add 0.5 ml of a solution of *sulphuric acid* containing 1 per cent w/v solution of *ammonium molybdate*; an intense blue colour is produced which changes to bluish green, green and finally, on standing, yellow.

C. Gives reaction A of lactates (2.3.1).

Tests

pH (2.4.24). 5.5 to 6.5, determined in a 1.0 per cent w/v solution.

Light absorption (2.4.7). Dissolve 0.1 g in 10 ml of *1 M hydrochloric acid* and add sufficient *water* to produce 100 ml; dilute 10 ml to 100 ml with *water.* Absorbance of the resulting solution at the maximum at about 278 nm, 0.50 to 0.54.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254.*

Mobile phase. A mixture of 94 volumes of *chloroform*, 3 volumes of *2-propylamine* and 3 volumes of *methanol.*

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of *chloroform.*

Reference solution (a). A 0.02 per cent w/v solution of the substance under examination in *chloroform.*

Reference solution (b). A 0.01 per cent w/v solution of the substance under examination in *chloroform.*

Reference solution (c). A 0.005 per cent w/v solution of the substance under examination in *chloroform.*

Apply to the plate 25 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. Heat the plate at 105° for 15 minutes, allow to cool, expose to iodine vapour and re-examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the

chromatogram obtained with reference solution (a); not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) and not more than four such spots are more intense than the spot in the chromatogram obtained with reference solution (c).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 60° at a pressure not exceeding 0.7 kPa for 16 hours.

Assay. Weigh accurately about 0.75 g of the substance under examination, dissolve in 50 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03754 g of $C_{19}H_{27}NO,C_3H_6O_3$.

Storage. Store protected from light and moisture.

Pentazocine Injection

Pentazocine Lactate Injection

Pentazocine Injection is a sterile solution in Water for Injections of either Pentazocine Lactate or pentazocine lactate prepared by the interaction of Pentazocine and Lactic Acid.

Pentazocine Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of pentazocine, $C_{19}H_{27}NO$.

Usual strength. The equivalent of 30 mg of pentazocine per ml; the equivalent of 60 mg of pentazocine per ml.

Description. A clear, colourless or almost colourless liquid.

Identification

A. To a volume containing 90 mg of pentazocine add 5 ml of *0.1 M sodium hydroxide* and shake the resulting solution with 5 ml of *chloroform*. Wash the chloroform extract with 2 ml of *water*, dry over *anhydrous sodium sulphate* and filter. Evaporate the chloroform without applying heat and dry the oily residue at a temperature not exceeding 25° and at a pressure of 2 kPa for 1 hour.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pentazocine RS* or with the reference spectrum of pentazocine (form B).

B. Dilute a volume containing 30 mg of pentazocine to 100 ml with *water*. To 10 ml add 10 ml of *1 M sodium hydroxide* and sufficient *water* to produce 100 ml. When examined in the range 230 nm to 360 nm (2.4.7), the solution shows absorption maxima, at about 238 nm and 298 nm.

C. To a volume containing 30 mg of pentazocine add 2 ml of *0.1 M sodium hydroxide*, extract with 2 ml of *chloroform* and evaporate 0.1 ml of the *chloroform* extract to dryness in a porcelain crucible. Add to the residue 0.5 ml of a 1 per cent w/v solution of *ammonium molybdate* in *sulphuric acid*; an intense blue colour is produced which changes to bluish green, green and finally, on standing, yellow.

Tests

pH (2.4.24). 4.0 to 5.0.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254*.

Mobile phase. A mixture of 94 volumes of *chloroform*, 3 volumes of *2-propylamine* and 3 volumes of *methanol*.

Test solution. Dilute a volume of the injection with sufficient *ethanol (95 per cent)* to produce a solution containing 2.0 per cent w/v solution of pentazocine.

Reference solution (a). Dilute 1 volume of the test solution to 100 volumes with *ethanol (95 per cent)*.

Reference solution (b). Dilute 1 volume of the test solution to 200 volumes with *ethanol (95 per cent)*.

Reference solution (c). Dilute 1 volume of the test solution to 400 volumes with *ethanol (95 per cent)*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. Heat the plate at 105° for 15 minutes, allow to cool, expose to iodine vapour and re-examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a), not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) and not more than four such spots are more intense than the spot in the chromatogram obtained with reference solution (c).

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

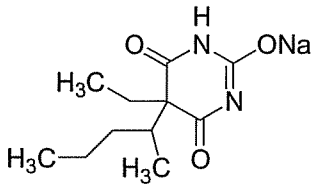
Assay. To an accurately measured volume containing about 0.15 g of pentazocine add sufficient *water* to produce 100.0 ml. To 5.0 ml add 1 ml of *1 M hydrochloric acid* and sufficient *water* to produce 100.0 ml. Measure the absorbance of the resulting solution at the maximum at about 278 nm (2.4.7). Calculate the content of $C_{19}H_{27}NO$, taking 69 as the specific absorbance at 278 nm.

Storage. Store protected from light.

Labelling. The label states the strength in terms of the equivalent amount of pentazocine in a suitable dose-volume.

Pentobarbitone Sodium

Soluble Pentobarbitone; Pentobarbital Sodium



$C_{11}H_{17}N_2NaO_3$ Mol. Wt. 248.3

Pentobarbitone Sodium is sodium 5-ethyl-5-[(1*RS*)-1-methylbutyl]barbiturate.

Pentobarbitone Sodium contains not less than 99.0 per cent and not more than 101.5 per cent of $C_{11}H_{17}N_2NaO_3$, calculated on the dried basis.

Category. Hypnotic.

Dose. 100 to 200 mg.

Description. A white, crystalline powder or granules; hygroscopic.

Identification

A. To 10 ml of a 10 per cent w/v solution add 5 ml of *2 M acetic acid*; a white, crystalline precipitate is produced. Filter, wash the precipitate with *water* and dry at 105°. Determine the melting point of the dried precipitate (2.4.21). Mix equal parts of the dried precipitate and *phenobarbitone RS* and determine the melting point (2.4.21). The difference between the melting points (which are about 131°) is not greater than 2°.

B. Complies with the test for identification of barbiturates (2.3.1), using the dried precipitate obtained in test A for preparing the test solution.

C. To 10 mg add 10 mg of *vanillin* and 2 ml of *sulphuric acid*, mix and heat on a water-bath for 2 minutes; a reddish-brown colour is produced. Cool and add 5 ml of *ethanol*; the colour changes to violet and then blue.

D. Ignite 1 g; the residue gives reaction A of sodium salts (2.3.1).

Tests

Appearance of solution. Prepare freshly a 10.0 per cent w/v solution in *carbon dioxide-free water* (solution A). Solution A is clear (2.4.1).

pH (2.4.24). 9.6 to 11.0, determined in solution A.

Related substances. Complies with the test for related substances in barbiturates (2.3.4), but applying 10 µl of each of the following solutions.

Test solution. A 2.0 per cent w/v solution of the substance under examination.

Reference solution. A 0.01 per cent w/v solution of the substance under examination.

Do not ignore any spot remaining on the line of application.

Free pentobarbitone. Not more than 3.5 per cent, determined by the following method. Weigh accurately about 2.0 g and dissolve in 75 ml of *dimethylformamide*, heating gently if necessary. Add 0.25 ml of a 1 per cent w/v solution of *thymol blue* in *dimethylformamide* and titrate with *0.1 M sodium methoxide* to a blue end-point. Carry out a blank titration.

1 ml of *0.1 M sodium methoxide* is equivalent to 0.02263 g of pentobarbitone.

Isomer. Dissolve 0.3 g in 5 ml of a 5 per cent w/v solution of *anhydrous sodium carbonate* and add 0.3 g of *4-nitrobenzyl bromide* dissolved in 10 ml of *ethanol (95 per cent)*. Heat under a reflux condenser for 30 minutes, cool to 25° scratch the side of the vessel with a glass rod if necessary to induce crystallisation and filter. Wash the residue with five quantities, each of 5 ml, of *water*. Transfer the residue as completely as possible to a small flask, add 25 ml of *ethanol (95 per cent)* and heat under a reflux condenser for 10 minutes; the solid dissolves completely. Cool to 25° and scratch the side of the flask with a glass rod to induce crystallisation. Filter, wash the residue with two quantities, each of 5 ml, of *water* and dry at 105° for 30 minutes. The dried residue melts at 136° to 148° (2.4.21).

Heavy metals (2.3.13). 0.67 g complies with the limit test for heavy metals, Method B (30 ppm).

Loss on drying (2.4.19). Not more than 3.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.4 g, dissolve in 25 ml of a 12.75 per cent w/v solution of *silver nitrate* in *pyridine* and titrate with *0.1 M ethanolic sodium hydroxide* using 0.5 ml of *thymolphthalein solution* as indicator, until a pure blue colour is obtained. Carry out a blank titration.

1 ml of *0.1 M ethanolic sodium hydroxide* is equivalent to 0.02483 g of $C_{11}H_{17}N_2NaO_3$.

Storage. Store protected from moisture.

Pentobarbitone Tablets

Pentobarbitone Sodium Tablets; Pentobarbital Sodium Tablets

Pentobarbitone Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of pentobarbitone sodium, $C_{11}H_{17}N_2NaO_3$.

Usual strength. 100 mg.

Identification

A. Shake a quantity of the powdered tablets containing 0.1 g of Pentobarbitone Sodium with 10 ml of a 10 per cent w/v solution of *pyridine* and filter. Add to the filtrate 1 ml of *cupric sulphate* with *pyridine solution* and set aside for 10 minutes; a reddish violet precipitate is produced.

B. Shake a quantity of the powdered tablets containing 0.1 g of Pentobarbitone Sodium with 10 ml of *water* and filter. To the filtrate add 2 ml of *hydrochloric acid*; a white precipitate is produced (distinction from pentobarbitone).

C. The residue obtained in the Assay melts at 127° to 130°(2.4.21).

D. The powdered tablets, when moistened with *hydrochloric acid* and introduced on a platinum wire into a flame, impart a yellow colour to the flame.

Tests

Isomer. Dissolve a quantity of the powdered tablets containing 0.3 g of Pentobarbitone Sodium in 5 ml of a 5 per cent w/v solution of *anhydrous sodium carbonate* and add 0.3 g of *4-nitrobenzyl bromide* dissolved in 10 ml of *ethanol (95 per cent)*. Heat under a reflux condenser for 30 minutes, cool to 25° scratch the side of the vessel with a glass rod if necessary to induce crystallisation and filter. Wash the residue with five quantities, each of 5 ml, of *water*. Transfer the residue as completely as possible to a small flask, add 25 ml of *ethanol (95 per cent)* and heat under a reflux condenser for 10 minutes; filter the hot solution. Cool to 25° and scratch the side of the flask with a glass rod to induce crystallisation. Filter, wash the residue with two quantities, each of 5 ml, of *water* and dry at 105° for 30 minutes. The dried residue melts at 136° to 148° (2.4.21).

Other tests. Complies with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 0.3 g of Pentobarbitone Sodium, dissolve as completely as possible in 10 ml of a 2 per cent w/v solution of *sodium hydroxide*, saturate with *sodium chloride*, acidify with *hydrochloric acid* and extract with successive quantities, each of 15 ml, of *ether* until complete extraction is effected. Wash the combined extracts with two quantities, each of 2 ml, of *water* and extract the combined washings with 10 ml of *ether*. Add the ether to the main ether layer, filter and wash the filter with *ether*. Evaporate the solvent and dry the residue to constant weight at 105°.

1 g of residue is equivalent to 1.097 g of $C_{11}H_{17}N_2NaO_3$.

Storage. Store protected from moisture.

Pepsin

Pepsin is obtained from the gastric mucosa of pigs, cattle or sheep. It contains gastric proteinases that are active in an acid medium, pH 1 to 5. It may contain a suitable diluent such as Lactose.

Pepsin has an activity equivalent to its ability to digest not less than 3000 times its weight of coagulated egg albumin when determined by the method given under Assay.

Category. Proteolytic enzyme.

Dose. 300 mg to 1 g.

Description. A white or light buff-coloured, crystalline or amorphous powder or translucent scales; odour, faint and meaty but not rancid; hygroscopic.

Identification

A. Place 1 ml of *congo red fibrin* on a filter paper and wash until a colourless filtrate is obtained with a solution prepared by diluting 30 ml of *1 M hydrochloric acid* to 1000 ml with *water* and adjusting the pH 1.5 to 1.7. Perforate the filter paper and wash the congo red fibrin through it with 20 ml of the same hydrochloric acid solution. Shake this suspension before use. Dissolve about 10 mg of the substance under examination in 2 ml of the hydrochloric acid solution and adjust the pH 1.5 to 1.7. Place 4 ml of the congo red fibrin suspension in each of two tubes. To one of the tubes add 1 ml of the solution of the substance under examination and to the other tube add 1 ml of *water* (control solution). Mix the contents of each tube and place in a water-bath at 25° with gentle shaking for 15 minutes; the control solution is colourless and the solution of the substance under examination is violet blue.

B. The proteolytic activity of a solution in *water* is destroyed at once by boiling. It is destroyed by warming for 10 minutes at 40° at a pH of 8.0.

Tests

Microbial contamination (2.2.9). 1 g is free from *Escherichia coli* and 10 g is free from *Salmonellae.*

Sulphated ash (2.3.18). Not more than 5.0 per cent.

Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 1.0 g by drying in an oven at 60° at a pressure not exceeding 0.7 kPa for 4 hours.

Assay. Weigh accurately 0.25 g, triturate with 1.0 g of *sodium chloride*, add slowly acidified *water* prepared by diluting 65 ml of *1 M hydrochloric acid* to 1000 ml with *water*, continue the trituration, dilute to 1000.0 ml with the acidified *water* and shake for 15 minutes. Prepare coagulated egg albumin by boiling fresh hen-eggs in *water* for 15 minutes, cooling rapidly to room temperature by immersion in cold *water*, separating

the whites and rubbing through a no. 44 sieve. Reject the first portion that passes through the sieve and triturate 15.0 g of freshly prepared coagulated egg albumin with 50 ml of the acidified *water* ensuring that the particles of egg albumin are thoroughly disintegrated, add a further 50 ml of the acidified *water* and keep in a water-bath at 51° ± 1° for 15 minutes. Add 20.0 ml of the prepared solution of the substance under examination and digest at 51° ± 1° for 4 hours, shaking at intervals of 15 minutes. Centrifuge and decant off most of the clear supernatant liquid, wash the remainder into a 10-ml graduated cylinder and allow to stand for 30 minutes. The volume of the undissolved albumin is not more than 2 ml.

Storage. Store protected from moisture.

Peritoneal Dialysis Solutions

Intraperitoneal Dialysis Fluids

Peritoneal Dialysis Solutions are sterile preparations for intraperitoneal use containing electrolytes with a concentration close to the electrolytic composition of plasma. They contain dextrose in varying concentrations and/or other suitable osmotic agents. They do not contain antioxidants such as metabisulphite salts.

Peritoneal Dialysis Solutions contain not less than 97.5 per cent and not more than 102.5 per cent of the stated amount of sodium, Na, not less than 95.0 per cent and not more than 105.0 per cent of the stated amounts of potassium, K, calcium, Ca, magnesium, Mg, chloride, Cl, acetate, $C_2H_3O_2$, lactate, $C_3H_5O_3$, sodium bicarbonate, $NaHCO_3$, bicarbonate, HCO_3 and dextrose, $C_6H_{12}O_6$.

Usual strengths: Several formulations are used. The concentrations of the components per litre of solution are usually in the following range.

	Concentration in mmol/litre
Sodium	125–150
Potassium	0–4.5
Calcium	0–2.5
Magnesium	0.25–1.5
Acetate and/or Lactate and/or Bicarbonate	30–60
Chloride	90–120
Dextrose	25–250

When bicarbonate is present, the solution of sodium bicarbonate is supplied in a separate container or a separate compartment and is added to the electrolyte solution immediately before use.

Unless otherwise justified and authorised, antioxidants such as metabisulphite salts are not added to the solutions.

Description. Clear, colourless or faintly straw-coloured solutions.

Identification

A. To 5 ml of the solution under examination, add 2 ml of *dilute sodium hydroxide solution* and 0.05 ml of *potassium cupri-tartrate solution*; the solution remains blue and clear. Heat to boiling; a copious red precipitate is formed.

B. 20 ml gives reactions of chlorides, sodium salts, potassium salts and calcium salts (2.3.1).

C. To 5 ml add 1 ml of *hydrochloric acid* in a test-tube fitted with a stopper and a bent tube, heat and collect a few ml of the distillate. The distillate gives reaction C of acetates (2.3.1).

D. To 0.1 ml of *titan yellow solution* add 10 ml of *water*, 2 ml of the solution under examination and 1 ml of *1 M sodium hydroxide*; a pink colour is produced if magnesium salts are present.

E. Lactates and bicarbonates are identified together with the Assay for lactate and bicarbonate.

Tests

Appearance of solution. The solution under examination is clear (2.4.1), and not more intensely coloured than reference solution YS4 (2.4.1).

pH (2.4.24). 4.5 to 6.5. If the solution contains bicarbonate, 6.5 to 8.0.

5-Hydroxymethylfurfural and Related substances. Dilute a volume containing 1.0 g of Dextrose to 250.0 ml with *water* and measure the absorbance of the resulting solution (2.4.7) at the maximum at about 284 nm; absorbance at about 284 nm, not more than 0.25.

Aluminium. Adjust the pH of 400 ml of the solution under examination to pH 6.0 and add 10 ml of *acetate buffer pH 6.0*. Extract the resulting solution with successive quantities of 20, 20 and 10 ml of a 0.5 per cent w/v solution of *8-hydroxyquinoline* in *chloroform* and dilute the combined extracts to 50.0 ml with *chloroform*. Use as the blank a mixture of 10 ml of *acetate buffer pH 6.0* and 100 ml of *water* treated in the same manner and as the standard solution a mixture of 2.0 ml of *aluminium standard solution (2 ppm Al)*, 10 ml of *acetate buffer pH 6.0* and 90 ml of *water* treated in the same manner. Measure the fluorescence of the test solution (I_1), of the standard solution (I_2) and of the blank (I_3), (2.4.5), using an excitation wavelength of 392 nm and a secondary filter with a transmission band centred at 518 nm, or a monochromator set to transmit at this wavelength. The fluorescence of the test solution ($I_1 - I_3$) is not greater than that of the standard solution ($I_2 - I_3$).

Particulate contamination (2.5.9). Carry out the test using 50 ml of the solution under examination.

The preparation meets the requirements of the test if it contains particles within the maximum limits shown below.

Particle size in µm (Equal to or larger than)	Maximum number of particles per ml
10	25
25	3

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Bacterial endotoxins (2.2.3). Not more than 0.25 Endotoxin Unit per ml.

Pyrogens (2.2.8). Solutions for which a validated test for bacterial endotoxins cannot be carried out, comply with the test for pyrogens, injecting 10 ml of the solution per kg of the rabbit's body weight.

Sterility (2.2.11). Complies with the test for sterility.

Assay. *For sodium* — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 589 nm and using sodium solution FP, or sodium solution AAS respectively, suitably diluted with *water* for the standard solutions.

For potassium — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 767 nm and using potassium solution FP or potassium solution AAS respectively, suitably diluted with *water* for the standard solutions.

For calcium — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 422.7 nm and using calcium solution FP or calcium solution AAS respectively, suitably diluted with *water* for the standard solutions.

For magnesium — To 50.0 ml add 50 ml of *water* and 5 ml of *strong ammonia-ammonium chloride solution* and titrate with *0.005 M disodium edetate* using 50 mg of *eriochrome black T mixture* as indicator.

1 ml of *0.005 M disodium edetate* is equivalent to 0.1215 mg of Mg.

For total chloride — Dilute an accurately measured volume containing about 60 mg of chloride to 50.0 ml with *water*. Add 25.0 ml of *0.1 M silver nitrate* and 2 ml of *nitric acid*. Filter, wash the precipitate with *water* slightly acidified with *nitric acid* and titrate the excess of silver nitrate with *0.1 M ammonium thiocyanate* using *ferric ammonium sulphate solution* as indicator until a reddish yellow colour is produced. Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of total chloride, calculated as Cl.

For acetate (if present) — Determine by liquid chromatography (2.4.14).

Test solution. Dilute an accurately measured volume of the preparation under examination quantitatively with *water* to obtain a solution containing about 1.0 mg of acetate per ml.

Reference solution. Dissolve an accurately weighed quantity of *sodium acetate* in *water* to obtain a solution having a known concentration of about 0.12 per cent w/v of *sodium acetate*.

Chromatographic system
- a stainless steel column 30 cm x 7.8 mm, packed with a strong cation-exchange resin consisting of sulphonated cross-linked styrene-divinylbenzene copolymer in the hydrogen form (7 µm),
- mobile phase: filtered and degassed *0.1 M sulphuric acid*,
- flow rate. 0.8 ml per minute,
- column temperature. 60°,
- spectrophotometer set at 210 nm,
- injection volume. 20 µl.

Inject the reference solution and record the chromatograms. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject separately the test and standard solutions and record the chromatograms. Measure the responses for the major peak and calculate the content of acetate in the preparation under examination.

For lactate (if present) — Determine by liquid chromatography (2.4.14).

Test solution. Use the preparation under examination.

Reference solution(a). Dissolve an accurately weighed quantity of *sodium lactate RS* in *water* to obtain a solution having a known concentration of about 2 mg per ml.

Reference solution (b). Prepare a solution in *water* containing about 3 mg of *anhydrous sodium acetate* and 3 mg of *sodium lactate RS* per ml.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane chemically bonded to porous silica or ceramic microparticles 3 to 10 µm,
- mobile phase: a filtered and degassed solution in *water* containing about 1 ml of *formic acid* and 1 ml of *dicyclohexylamine* per litre,
- flow rate. 1 ml per minute,

- spectrophotometer set at 210 nm,
- injection volume. 20 µl.

Inject separately reference solutions (a) and (b), and record the chromatograms. The test is not valid unless the resolution between the peaks due to acetate and lactate is not less than 2.0, the tailing factor for the analyte peak is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject separately the test solution and reference solution (a), and record the chromatograms. Measure the responses for the major peak and calculate the content of lactate in the preparation under examination.

For sodium bicarbonate — Titrate with *0.1 M hydrochloric acid* a volume of the preparation under examination containing about 0.1 g of *sodium bicarbonate*, determining the end-point potentiometrically (2.4.25).

1 ml of *0.1 M hydrochloric acid* is equivalent to 8.40 mg of $NaHCO_3$.

For lactate and bicarbonate — Determine by liquid chromatography (2.4.14).

Test solution. Use the preparation under examination.

Reference solutions. Dissolve accurately weighed quantities of lactates and bicarbonates in order to obtain solutions having concentrations of about 90 per cent, 100 per cent and 110 per cent of the claim in 100 ml of *water*.

Chromatographic system

- a stainless steel column 30 cm x 7.8 mm, packed with a cation-exchange resin (9 µm),
- column temperature. 85°,
- mobile phase: filtered and degassed *0.005 M sulphuric acid*,
- flow rate. 0.6 ml per minute,
- differential refractometer detector,
- injection volume. 20 µl.

Inject separately the test solution and the reference solutions in duplicate, and record the chromatograms in the prescribed conditions. The peaks elute in the following order, lactates, then bicarbonates. Determine the concentration of lactates and bicarbonates in the test solution by interpolating the peak area for lactate and the peak height for bicarbonate from the linear regression curve obtained with the solutions prepared as reference solutions.

For dextrose — Transfer a volume of the preparation under examination containing about 25 mg of Dextrose to a 250-ml conical flask with a ground-glass neck and add 25.0 ml of *cupri-citric solution*. Add a few grains of pumice, fit a reflux condenser, heat so that boiling occurs within 2 minutes and boil for exactly 10 minutes. Cool and add 3 g of *potassium iodide* dissolved in 3 ml of *water*. Carefully add, in small amounts, 25 ml of a 25 per cent w/w solution of *sulphuric acid*.

Titrate with *0.1 M sodium thiosulphate* using *starch solution* as indicator. Carry out a blank titration using 25 ml of *water*.

Calculate the content of anhydrous dextrose, $C_6H_{12}O_6$, from the following Table.

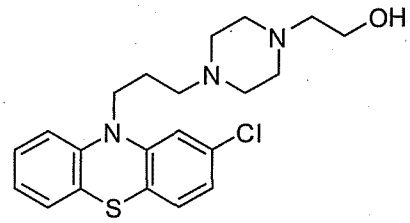
Volume of *0.1 M sodium thiosulphate* consumed (ml)	Anhydrous dextrose (mg)
8	19.8
9	22.4
10	25.0
11	27.6
12	30.3
13	33.0
14	35.7
15	38.5
16	41.3

Storage. Peritoneal Dialysis Solutions are supplied in rigid or semi-rigid plastic containers, in flexible plastic containers fitted with a special connecting device (these are generally filled to a volume below their nominal capacity and presented in closed protective envelopes) or in glass containers. Store at a temperature not exceeding 30°.

CAUTION — Exposure to temperatures below 4° may cause crystallisation and separation of solid particles rendering the preparation unsuitable for use.

Labelling. The label states (1) the formula of the solution for peritoneal dialysis, expressed in grams per litre and in millimoles per litre; (2) the total osmolar concentration in mOsmol per litre; (3) the nominal volume of the solution in the container; (4) that the solution is free from bacterial endotoxins, or where applicable, that it is apyrogenic; (5) that the solution is not to be used for intravenous infusion; (6) that any unused portion of the solution is to be discarded; (7) that the solution containing visible particles should not be used; (8) the storage conditions.

Perphenazine



$C_{21}H_{26}ClN_3OS$ Mol. Wt. 404.0

Perphenazine is 2-[4-[3-(2-chloro-10*H*-phenothiazin-10-yl)propyl]piperazin-1-yl]ethanol.

Perphenazine contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{21}H_{26}ClN_3OS$, calculated on the dried basis.

Category. Dopamine receptor antagonist; neuroleptic.

Description. A white or yellowish-white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *perphenazine RS* or with the reference spectrum of perphenazine.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *kieselguhr G*.

Mobile phase. A mixture of 2 volumes of *diethylamine* and 100 volumes of *light petroleum*, saturated with *phenoxyethanol* (add 6 volumes *phenoxyethanol* to 8 volumes of the above mixture until there is a persistent cloudiness after shaking, decant, and use the supernatant liquid, even if it is cloudy).

Test solution. Dissolve 20 mg of the substance under examination in 10 ml of *chloroform*.

Reference solution. A 0.2 per cent w/v solution of *perphenazine RS* in *chloroform*.

Impregnate the plate by placing it in a closed tank containing the necessary quantity of the impregnation mixture containing 2.5 per cent v/v of *phenoxyethanol* and 7.5 per cent v/v of *formamide* in *acetone* so that the plate dips about 5 mm beneath the surface of the liquid. When the impregnation mixture has risen at least 17 cm from the lower edge of the plate, remove the plate and use immediately. Carry out the chromatography in the same direction as the impregnation.

Apply to the plate 2 µl of each solution. Develop in the dark and allow the mobile phase to rise 15 cm. Expose the plate to ultraviolet light at 365 nm and examine after a few minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution. Dry the plate at 120° for 20 minutes, allow to cool and spray with a 10 per cent v/v solution of *sulphuric acid* in *ethanol (95 per cent)*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

C. When examined in the range 230 nm to 350 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* shows absorption maxima at 257 nm and 313 nm. The ratio of the absorbance measured at the maximum at 313 nm to that measured at the maximum at 257 nm is 0.120 to 0.128.

D. Melting range (2.4.21). 96° to 100°.

Tests

Appearance of solution. A 2.0 per cent w/v solution in *methanol* is clear (2.4.1).

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

NOTE—Prepare the solutions immediately before use.

Mobile phase. A mixture of 1 volume of *concentrated ammonia*, 14 volumes of *water* and 85 volumes of *butanol*.

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of *methanol*.

Reference solution. Dilute 0.5 ml of the test solution to 100 ml with *methanol*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in vacuum at 65° for 4 hours.

Assay. Weigh accurately about 0.15 g and dissolve in 25 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.0202 g of $C_{21}H_{26}ClN_3OS$.

Calculate the content of $C_{21}H_{26}ClN_3OS$.

Storage. Store protected from light.

Perphenazine Tablets

Perphenazine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of perphenazine, $C_{21}H_{26}ClN_3OS$.

Usual strengths. 2 mg; 4 mg.

Identification

A. To a quantity of the powdered tablets containing 40 mg of Perphenazine, add 10 ml of *water* and 2 ml of *1 M sodium hydroxide*, shake and extract with 15 ml of *ether*. Wash the ether layer with 5 ml of *water*, dry with *anhydrous sodium sulphate* and evaporate the *ether* to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6).

Compare the spectrum with that obtained with *perphenazine RS* or with the reference spectrum of perphenazine.

B. Extract a quantity of the powdered tablets containing 20 mg of Perphenazine with 10 ml of *chloroform*, filter and evaporate the filtrate to dryness. Dissolve the residue in 2 ml of *methanol*, pour into a 4.0 per cent w/v solution of *picric acid* in *methanol* at 50°, cool and allow to stand for 4 hours. After recrystallisation from *methanol*, the precipitate melts at about 248° (2.4.21) with decomposition.

C. To a quantity of the powdered tablets containing 5 mg of Perphenazine, add 5 ml of *sulphuric acid* and allow to stand for 5 minutes. A red colour is produced.

Tests

Related substances. Comply with the test for Related substances in Phenothiazines (2.3.5) with the following modifications.

Use mobile phase (c) and applying to the plate 50 µl of each of the following freshly prepared solutions.

Test solution. Extract a quantity of the powdered tablets containing 20 mg of Perphenazine with 10 ml of *ethanol* (*95 per cent*) and filter.

Reference solution. Dilute 1 ml of the test solution to 200 ml with the *ethanol* (*95 per cent*).

Uniformity of content. *(For tablets containing 10 mg or less)*. Comply with the test stated under Tablets.

NOTE—Carry out the test protected from light.

Transfer one tablet to a 100-ml volumetric flask and add 5 ml of *water*, mix with the aid of ultrasound for 15 minutes or until the tablet has completely disintegrated, heat on a water-bath for 3 minutes, swirling continuously and cool. Add 50 ml of *ethanol* (*95 per cent*), mix with the aid of ultrasound for 2 minutes, shake for 5 minutes, dilute to 100 ml with *ethanol* (*95 per cent*) and filter through a glass microfibre filter paper. Dilute the filtrate with *ethanol* (*95 per cent*) to produce a solution containing 0.001 per cent w/v of Perphenazine. Record the second-derivative ultraviolet absorption spectra of the resulting solution in the range 210 to 290 nm (2.4.7). Measure the amplitude from the peak at 265 nm to the trough at 255 nm.

Calculate the content of $C_{21}H_{26}N_3OS$ in the tablet from the absorbance obtained by repeating the operation using *perphenazine RS* in place of the substance under examination.

Other tests. Comply with the tests stated under Tablets.

Assay. *For tablets containing more than 10 mg.*

NOTE—Carry out the test protected from light.

Shake 10 whole tablets with 50 ml of *water* and mix with the aid of ultrasound for 15 minutes or until the tablets have completely disintegrated, heat on a water-bath for 3 minutes, swirling continuously, cool, add 400 ml of *ethanol* (*95 per cent*), mix with the aid of ultrasound for 2 minutes, shake for 5 minutes, dilute to 500 ml with *ethanol* (*95 per cent*) and filter through a glass microfibre filter paper. Dilute the filtrate with *ethanol* (*95 per cent*) to produce a solution containing 0.001 per cent w/v of Perphenazine. Record second-derivative ultraviolet absorption spectra of the solutions in the range 210 to 290 nm (2.4.7). Measure the amplitude from the peak at 265 nm to the trough at 255 nm.

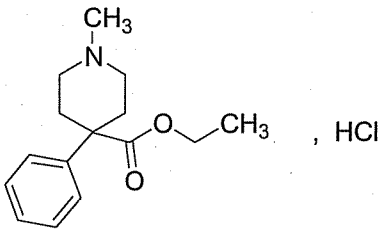
Calculate the content of $C_{21}H_{26}N_3OS$ in the tablet from the absorbance obtained by repeating the operation using *perphenazine RS* in place of the substance under examination.

For tablets containing 10 mg or less.

Use the average of the 10 individual results obtained in the test for Uniformity of content.

Pethidine Hydrochloride

Meperidine Hydrochloride



$C_{15}H_{21}NO_2,HCl$ Mol. Wt. 283.8

Pethidine Hydrochloride is ethyl 1-methyl-4-phenylpiperidine-4-carboxylate hydrochloride.

Pethidine Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{15}H_{21}NO_2,HCl$, calculated on the dried basis.

Category. Narcotic analgesic.

Dose. Orally, 50 to 150 mg every 4 hours; by subcutaneous or intramuscular injection, 25 to 100 mg every 4 hours; by slow intravenous injection, 25 to 50 mg every 4 hours.

Description. Colourless crystals or a white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pethidine*

hydrochloride RS or with the reference spectrum of pethidine hydrochloride.

B. To 5 ml of a 1 per cent w/v solution add a few drops of *potassium mercuri-iodide solution*; a cream-coloured precipitate is produced.

C. Dissolve 5 mg in 0.5 ml of *water* and add 0.1 ml of *formaldehyde solution* and 2 ml of *sulphuric acid*; an orange-red colour is produced.

D. Gives reaction A of chlorides (2.3.1).

Tests

Appearance of solution. A 2.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. To 10 ml of a 2.0 per cent w/v solution in *carbon dioxide-free water* add 0.2 ml of *methyl red solution* and 0.2 ml of *0.01 M sodium hydroxide*; the solution is yellow. Add 0.3 ml of *0.01 M hydrochloric acid*; the solution is red.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 20 volumes of *acetonitrile* and 80 volumes of *water*.

Test solution (a). Dissolve about 0.1 g of the substance under examination in 25.0 ml of the solvent mixture.

Test solution (b). Dissolve about 0.125 g of the substance under examination in 10.0 ml of the solvent mixture.

Reference solution (a). Dilute 0.5 ml of test solution (a) to 100.0 ml with the solvent mixture.

Reference solution (b). Dissolve 12.5 mg of *1-methyl-4-phenyl-1,2,3,6- tetrahydropyridine* in 10.0 ml of the solvent mixture. Dilute 1.0 ml of this solution to 100.0 ml with the solvent mixture.

Reference solution (c). Dilute 5.0 ml of reference solution (b) and 1.0 ml of reference solution (c) to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.0 mm packed with endcapped octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS2),
- mobile phase: A. a mixture of equal volumes of 4.2 per cent w/v solution of *sodium perchlorate* and 1.2 per cent v/v solution of *orthophosphoric acid*, adjusted to pH 2.0 with *triethylamine*,
  B. *acetonitrile*,
- a linear gradient programme using the conditions given below,
- flow rate. 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume. 50 µl.

Time (min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0 – 15	80 →75	20 →25
15 – 31	75 →55	25 →45
31 – 40	55	45
40 – 41	55 →80	45 →20
41 – 50	80	20

Inject reference solution (c). The test is not valid unless the signal-to-noise ratio for the first peak is not less than 10 and peak-to-valley ratio where H_p is height above the baseline, and H_v is height above the baseline of the lowest point of the curve separating this peak from the peak due to impurity A is not less than 4.0. The relative retention time with reference to pethidine for pethidine impurity B is about 0.66 and for pethidine impurity A is about 0.68.

Inject test solution (a), (b), reference solution (a) and (c). In the chromatogram obtained with test solution (b), the area of the peak due to 1-methyl-4-phenyl-1,2,3,6-tetrahydropyridine (pethidine impurity B) is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (10 ppm). In the chromatogram obtained with test solution (a), the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.5 g, dissolve in 30 ml of *anhydrous glacial acetic acid*, add 12 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02838 g of $C_{15}H_{21}NO_2,HCl$.

Storage. Store protected from light and moisture.

Pethidine Injection

Pethidine Hydrochloride Injection; Meperidine Hydrochloride Injection

Pethidine Injection is a sterile solution of Pethidine Hydrochloride in Water for Injections.

Pethidine Injection contains not less than 95.0 per cent and not more than 105.0 per cent of pethidine hydrochloride, $C_{15}H_{21}NO_2,HCl$.

Usual strength. 50 mg per ml.

Identification

A. To a volume containing 50 mg of Pethidine Hydrochloride add sufficient *1 M sodium hydroxide* to make strongly alkaline to litmus paper and extract with two quantities, each of 10 ml, of *chloroform*. Wash the combined extracts with 5 ml of *water*, dry over *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness. Remove the last traces of chloroform by drying the residual oil at 60° at a pressure not exceeding 0.7 kPa.

On the oily residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pethidine hydrochloride RS* or with the reference spectrum of pethidine.

B. To 0.5 ml add 0.1 ml of *formaldehyde solution* and 2 ml of *sulphuric acid*; an orange-red colour is produced.

C. Gives the reactions of chlorides (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 20 volumes of *acetonitrile* and 80 volumes of *water*.

Test solution. Dilute a volume of the injection containing 0.1 g of Pethidine Hydrochloride with 25.0 ml of the solvent mixture.

Reference solution. Dilute 0.5 ml of the test solution to 100.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm packed with endcapped octadecylsilane bonded to porous silica (5 µm) (Such as Kromasil C18),
- mobile phase: A. a mixture of equal volumes of 4.2 per cent w/v solution of *sodium perchlorate* and 1.2 per cent v/v solution of *orthophosphoric acid*, adjusted to pH 2.0 with *triethylamine*,
  B. *acetonitrile*,
- a linear gradient programme using the conditions given below,
- flow rate. 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume. 20 µl.

Time (min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0 – 15	80 → 75	20 → 25
15 – 31	75 → 55	25 → 45
31 – 40	55	45
40 – 41	55 → 80	45 → 20
41 – 50	80	20

Inject the test solution and the reference solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of the injection containing about 0.1 g of Pethidine Hydrochloride with 100.0 ml of the *water*. Dilute 3.0 ml of this solution to 25.0 ml with the mobile phase.

Reference solution. A 0.1 per cent w/v solution of *pethidine hydrochloride RS*. Dilute 3.0 ml of this solution to 25.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm packed with endcapped octadecylsilane bonded to porous silica (5 µm) (Such as Spherisorb ODS1),
- column temperature. 40°,
- mobile phase: a mixture of 110 volumes of *acetonitrile* and 90 volumes of a solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water*, add 10 ml *triethylamine*, adjusted to pH 7.0 with *orthophosphoric acid*,
- flow rate. 2 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the theoritical plates is not less than 8000.

Injet the test solution and the reference solution.

Calculate the content of $C_{15}H_{21}NO_2$,HCl in the injection.

Storage. Store protected from light.

Pethidine Tablets

Pethidine Hydrochloride Tablets; Meperidine Hydrochloride Tablets

Pethidine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of pethidine hydrochloride, $C_{15}H_{21}NO_2$,HCl.

Usual strengths. 25 mg; 50 mg.

Identification

A. Shake a quantity of the powdered tablets containing 50 mg of Pethidine Hydrochloride with 20 ml of *chloroform*, filter, evaporate the filtrate to dryness and dry the residue at a pressure of 2 kPa.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pethidine hydrochloride RS* or with the reference spectrum of pethidine hydrochloride.

B. Shake a quantity of the powdered tablets containing 0.2 g of Pethidine Hydrochloride with 20 ml of *water* and filter. To 5 ml of the filtrate add 10 ml of picric acid solution. The crystals so obtained, after washing with *water* and drying, melt at about 190° (2.4.21).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *kieselguhr G*.

Mobile phase. The upper layer obtained by shaking together 100 volumes of *light petroleum (50° to 70°)*, 8 volumes of *2-phenoxyethanol* and 1 volume of *diethylamine*.

Test solution. The upper layer obtained by shaking a quantity of the powdered tablets containing 0.1 g of Pethidine Hydrochloride with 5 ml of *water*, filtering, shaking the filtrate with 0.5 ml of *5 M sodium hydroxide* and 2 ml of *ether* and allowing the layers to separate.

Reference solution. Dilute 0.5 ml of the test solution to 50 ml with *ether*.

Impregnate the dry plate by placing it in a closed tank containing a mixture of 90 volumes of *acetone* and 10 volumes of *2-phenoxyethanol* so that the plate dips about 5 mm beneath the surface of the liquid, allowing the impregnating solvent to ascend at least 15 cm, removing the plate from the tank and drying in a current of air. Use immediately, with the flow of the mobile phase in the same direction as the impregnation.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in air for 10 minutes, return the plate to the tank and repeat the development. Remove the plate, allow it to dry in air for 10 minutes and spray with a 0.2 per cent w/v solution of *2,7-dichlorofluorescein* in *methanol*. Allow to stand for 5 minutes and spray with *water* until the background is white to pale yellow. Examine in daylight. The chromatograms show red or orange spots. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution. Examine without delay in ultraviolet light at 365 nm. The chromatograms show spots with intense yellow fluorescence. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

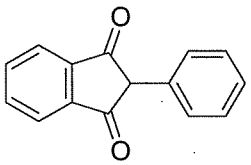
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 0.3 g of Pethidine Hydrochloride in 40 ml of *water*, add 2 ml of *5 M sodium hydroxide* and extract immediately with successive quantities of 25, 10 and 10 ml of *chloroform*. Wash each extract with the same 15 ml of *water* and filter into a dry flask. Combine the extracts (which should be clear and free from droplets of *water*). Titrate with *0.05 M perchloric acid*, using 0.15 ml of *1-naphtholbenzein solution* as indicator. Carry out a blank titration.

1 ml of *0.05 M perchloric acid* is equivalent to 0.01419 g of $C_{15}H_{21}NO_2,HCl$.

Storage. Store protected from light and moisture.

Phenindione



$C_{15}H_{10}O_2$ Mol. Wt. 222.2

Phenindione is 2-phenylindane-1,3-dione.

Phenindione contains not less than 98.0 per cent and not more than 100.5 per cent of $C_{15}H_{10}O_2$, calculated on the dried basis.

Category. Anticoagulant.

Dose. Initially, 200 to 300 mg; subsequently 25 to 100 mg daily, in accordance with the needs of the patient.

Description. Soft, white or creamy-white crystals; almost odourless.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenindione RS*.

B. Dissolve 0.1 g in 30 ml of *ethanol (95 per cent)* with the aid of heat, cool and add sufficient *ethanol (95 per cent)* to produce 50 ml. Dilute 10 ml of this solution to 250 ml with *0.1 M sodium hydroxide* and further dilute 5 ml to 100 ml with *0.1 M sodium hydroxide*. When examined in the range 230 nm and 360 nm (2.4.7), the solution shows absorption maxima at

about 278 nm and at about 330 nm; absorbance at about 278 nm, about 0.55 and at about 330 nm, about 0.16.

C. To 1 g add 50 ml of *ethanol (95 per cent)* and 0.5 ml of *aniline*, heat gently under a reflux condenser for 3 hours, cool in ice and filter. The residue, after washing with 2 ml of *ethanol (95 per cent)* and recrystallisation from *chloroform*, melts at about 225° (2.4.21).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A 0.02 per cent w/v solution of *butylated hydroxytoluene* in a mixture of 80 volumes of *toluene*, 20 volumes of *ethyl acetate* and 4 volumes of *glacial acetic acid.*

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of *dichloromethane.*

Reference solution (a). A 0.02 per cent w/v solution of the substance under examination in *dichloromethane.*

Reference solution (b). A 0.005 per cent w/v solution of the substance under examination in *dichloromethane.*

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 4 cm. Dry the plate in warm air and examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in oven at 105° for 2 hours.

Assay. Weigh accurately about 0.3 g, add 50 ml of *ethanol (95 per cent)* and warm until solution is effected. Cool to room temperature, add 10 ml of a 10 per cent v/v solution of *bromine* in *ethanol (95 per cent)* and allow to stand for 10 minutes, shaking occasionally. Add 1 g of *2-naphthol* and shake until the colour of the bromine is discharged. Remove any vapour of bromine in the flask with a current of air, add 50 ml of *water* and 10 ml of *dilute potassium iodide solution* and titrate the liberated iodine with *0.1 M sodium thiosulphate* using *starch solution* as indicator.

1 ml of *0.1 M sodium thiosulphate* is equivalent to 0.01111 g of $C_{15}H_{10}O_2$.

Storage. Store protected from moisture.

Phenindione Tablets

Phenindione Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of phenindione, $C_{15}H_{10}O_2$.

Usual strength. 50 mg.

Identification

Shake a quantity of the powdered tablets containing 0.2 g of Phenindione with 50 ml of *chloroform*, filter and evaporate the filtrate to dryness. Recrystallise the residue from *ethanol (95 per cent).* The crystals complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenindione RS.*

B. Dissolve 0.1 g in 30 ml of *ethanol (95 per cent)* with the aid of heat, cool and add sufficient *ethanol (95 per cent)* to produce 50 ml. Dilute 10 ml of this solution to 250 ml with *0.1 M sodium hydroxide* and further dilute 5 ml to 100 ml with *0.1 M sodium hydroxide.* When examined in the range 230 nm to 360 nm (2.4.7), the solution shows absorption maxima at about 278 nm and 330 nm; absorbance at about 278. about 0.55 and at about 330 nm, about 0.16.

C. To 50 mg add 1 ml of *sulphuric acid*; a deep blue to violet solution is produced. On dilution with *water* the solution becomes colourless and a white precipitate is produced.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A 0.02 per cent w/v solution of *butylated hydroxytoluene* in a mixture of 80 volumes of *toluene*, 20 volumes of *ethyl acetate* and 4 volumes of *glacial acetic acid.*

Test solution. Shake a quantity of the powdered tablets containing 50 mg of Phenindione with 15 ml of *dichloromethane*, filter, evaporate the filtrate to dryness and dissolve the residue in 5 ml of *dichloromethane.*

Reference solution (a). Dilute 1 volume of the test solution to 50 volumes with *dichloromethane.*

Reference solution (b). Dilute 1 volume of the test solution to 200 volumes with *dichloromethane.*

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 4 cm. Dry the plate in warm air and examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is

more intense than the spot in the chromatogram obtained with reference solution (b).

Uniformity of content. *(For tablets containing 50 mg or less)* — Comply with the test stated under Tablets.

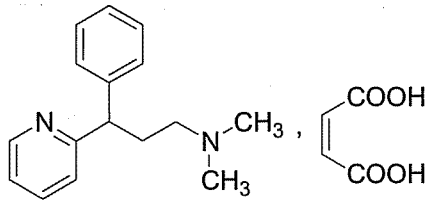
Place one tablet in 50 ml of *0.1 M sodium hydroxide*, dissolve completely by shaking gently, add a further 100 ml of *0.1 M sodium hydroxide* and shake for 1 hour. Dilute to 250.0 ml with *0.1 M sodium hydroxide*, filter and dilute a portion of the filtrate with sufficient *0.1 M sodium hydroxide* to produce a solution containing 4 µg of Phenindione per ml. Measure the absorbance of the resulting solution at the maximum at about 278 nm (2.4.7). Calculate the content of $C_{15}H_{10}O_2$ taking 1310 as the specific absorbance at 278 nm.

Other tests. Complies with the tests stated under Tablets.

Assay. Weigh and powder 20 Tablets. Weigh accurately a quantity of the powder containing about 50 mg of Phenindione and shake with 150 ml of *0.1 M sodium hydroxide* for 1 hour, add sufficient *0.1 M sodium hydroxide* to produce 250.0 ml, filter and dilute 5.0 ml of the filtrate to 250.0 ml with *0.1 M sodium hydroxide*. Measure the absorbance of the resulting solution at the maximum at about 278 nm (2.4.7). Calculate the content of $C_{15}H_{10}O_2$ taking 1310 as the specific absorbance at 278 nm.

Storage. Store protected from moisture.

Pheniramine Maleate



$C_{16}H_{20}N_2,C_4H_4O_4$ Mol. Wt. 356.4

Pheniramine Maleate is (3*RS*)-*N*,*N*-dimethyl-3-phenyl-3-(pyridin-2-yl)propan-1-amine hydrogen maleate.

Pheniramine Maleate contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{16}H_{20}N_2,C_4H_4O_4$, calculated on the dried basis.

Category. Antihistaminic.

Dose. Orally, 25 to 50 mg daily, in divided doses; by intramuscular or slow intravenous injection, 22.5 to 45 mg daily, in divided doses.

Description. A white or almost white, crystalline powder; odourless or almost odourless.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pheniramine maleate RS* or with the reference spectrum of pheniramine maleate.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.002 per cent w/v solution in *0.1 M hydrochloric acid* shows an inflection at about 262 nm; absorbance at about 265 nm, about 0.42.

C. Dissolve 0.25 g in 5 ml of *water*, add 2 ml of *strong ammonia solution* and extract with three quantities, each of 5 ml, of *chloroform*. Evaporate the aqueous extract to dryness, add 0.2 ml of *1 M sulphuric acid* and 5 ml of *water*, extract with four quantities, each of 25 ml, of *ether* and evaporate the combined ether extracts to dryness in a current of warm air. To the residue add 50 mg of *resorcinol* and 1 ml of *sulphuric acid*, heat in a water-bath for 2 minutes, shake well, heat in a water-bath for a further 30 minutes and cool in ice. Carefully add 5 ml of *water*; a yellow colour is produced. To 2 ml of the solution add 3 ml of a 50 per cent w/v solution of *ammonium acetate*, previously cooled in ice; a pink colour is produced which persists for at least 10 minutes in the cooled solution.

Tests

pH (2.4.24). 4.5 to 5.5, determined in a 1.0 per cent w/v solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 50 volumes of *cyclohexane*, 40 volumes of *chloroform* and 10 volumes of *diethylamine*.

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of *methanol*.

Reference solution (a). A 0.02 per cent w/v solution of the substance under examination in *methanol*.

Reference solution (b). A 0.004 per cent w/v solution of the substance under examination in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air, spray with *dilute potassium iodobismuthate solution*. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

Heavy metals (2.3.13). Dissolve 1.0 g in 10 ml of *water* and add 2 ml of *acetic acid* and sufficient *water* to produce 25 ml. The resulting solution complies with the limit test for heavy metals, Method A (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 60° at a pressure not exceeding 0.7 kPa.

Assay. Weigh accurately about 0.4 g, dissolve in 20 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, using *1- naphtholbenzein solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01782 g of $C_{16}H_{20}N_2,C_4H_4O_4$.

Storage. Store protected from light and moisture.

Pheniramine Injection

Pheniramine Maleate Injection

Pheniramine Injection is a sterile solution of Pheniramine Maleate in Water for Injections.

Pheniramine Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of pheniramine maleate, $C_{16}H_{20}N_2, C_4H_4O_4$.

Usual strength. 22.75 mg per ml.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 50 volumes of *cyclohexane*, 40 volumes of *chloroform* and 10 volumes of *diethylamine*.

Test solution. Evaporate an appropriate volume of the injection to dryness in a current of nitrogen using the minimum amount of heat, dissolve the residue in sufficient *chloroform* to produce a solution containing 2.0 per cent w/v solution of Pheniramine Maleate and centrifuge.

Reference solution. A 2.0 per cent w/v solution of *pheniramine maleate RS* in *chloroform*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. The two principal spots in the chromatogram obtained with the test solution correspond to those in the chromatogram obtained with the reference solution. Spray the plate with *dilute potassium iodobismuthate solution*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 4.5 to 5.5.

Related substances. Determine by the method described under the Identification test using as the reference solution a solution prepared by diluting 1 volume of the test solution to 500 volumes with *chloroform*. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. To an accurately measured volume containing about 0.11 g of Pheniramine Maleate add sufficient *water* to produce 50.0 ml and mix well. To 20.0 ml add sufficient *1 M sodium hydroxide* to make the solution just alkaline to *litmus paper*, add 2 ml in excess and extract with two quantities, each of 50 ml, of *ether*. Wash each ether extract in succession with 20, 20 and 5 ml of *0.1 M hydrochloric acid*, dilute the combined extracts to 100.0 ml with *0.1 M hydrochloric acid* and mix. Dilute 5.0 ml to 100.0 ml with *0.1 M hydrochloric acid* and measure the absorbance of the resulting solution at the maximum at about 265 nm (2.4.7), using *0.1 M hydrochloric acid* as the blank. Calculate the content of $C_{16}H_{20}N_2$, $C_4H_4O_4$ taking 210 as the specific absorbance at 265 nm.

Storage. Store protected from light.

Pheniramine Tablets

Pheniramine Maleate Tablets

Pheniramine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of pheniramine maleate, $C_{16}H_{20}N_2, C_4H_4O_4$.

Usual strengths. 12.5 mg; 25 mg; 50 mg.

Identification

Boil a quantity of the powdered tablets containing about 0.5 g of Pheniramine Maleate with 150 ml of *acetone* under a reflux condenser for about 45 minutes. Filter and evaporate the filtrate to dryness on a water-bath. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pheniramine maleate RS* or with the reference spectrum of pheniramine maleate.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.002 per cent w/v solution in *0.1 M hydrochloric acid* shows an inflection at about 262 nm; absorbance at about 265 nm, about 0.42.

C. Dissolve 0.25 g in 5 ml of *water*, add 2 ml of *strong ammonia solution* and extract with three quantities, each of 5 ml, of *chloroform*. Evaporate the aqueous extract to dryness, add 0.2 ml of *1 M sulphuric acid* and 5 ml of *water*, extract with four quantities, each of 25 ml, of *ether* and evaporate the combined ether extracts to dryness in a current of warm air. To the residue add 50 mg of *resorcinol* and 1 ml of *sulphuric acid*, heat in a water-bath for 2 minutes, shake well, heat in a water-bath for a further 30 minutes and cool in ice. Carefully add 5 ml of *water*; a yellow colour is produced. To 2 ml of the solution add 3 ml of a 50 per cent w/v solution of *ammonium acetate*, previously cooled in ice; a pink colour is produced which persists for at least 10 minutes in the cooled solution.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 50 volumes of *cyclohexane*, 40 volumes of *chloroform* and 10 volumes of *diethylamine*.

Test solution. Shake a quantity of the powdered tablets containing 20 mg of Pheniramine Maleate with 10 ml of *methanol*, centrifuge and use the supernatant liquid.

Reference solution (a). Dilute 1 volume of the test solution to 100 volumes with *methanol*.

Reference solution (b). Dilute 1 volume of reference solution (a) to 20 volumes with *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air, spray with *dilute potassium iodobismuthate solution*. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

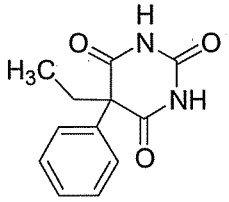
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 45 mg of Pheniramine Maleate, shake with 20 ml of *0.1 M hydrochloric acid*, centrifuge and transfer the supernatant liquid to a 100-ml volumetric flask. Repeat the extraction with three further quantities, each of 20 ml, of *0.1 M hydrochloric acid*. Combine the extracts and add sufficient *0.1 M hydrochloric acid* to produce 100.0 ml. Mix and dilute 5.0 ml to 100.0 ml with *0.1 M hydrochloric acid*; measure the absorbance of the resulting solution at the maximum at about 265 nm (2.4.7), using *0.1 M hydrochloric acid* as the blank. Calculate the content of $C_{16}H_{20}N_2,C_4H_4O_4$ taking 210 as the specific absorbance at 265 nm.

Storage. Store protected from light and moisture.

Phenobarbitone

Phenobarbital



$C_{12}H_{12}N_2O_3$ Mol. Wt. 232.2

Phenobarbitone is 5-ethyl-5-phenylbarbituric acid.

Phenobarbitone contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{12}H_{12}N_2O_3$, calculated on the dried basis.

Category. Sedative; anticonvulsant.

Dose. 60 to 300 mg at night.

Description. Colourless crystals or a white, crystalline powder; odourless.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests C, D and E may be omitted if tests A and B are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenobarbitone RS* or with the reference spectrum of phenobarbitone.

B. Determine the melting point (2.4.21) of the substance under examination and of a mixture of equal quantities of the substance under examination and *phenobarbitone RS*. The difference between the melting points, which are about 175°, is not greater than 2°.

C. Complies with the test for identification of barbiturates (2.3.2).

D. Dissolve about 20 mg in 5 ml of *ethanol*, add a drop of *cobalt chloride solution* and a drop of *dilute ammonia solution*; a violet colour is produced.

E. Gives the reaction of non-nitrogen substituted barbiturates (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in a mixture of 20 volumes of *2 M sodium hydroxide* and 30 volumes of *water* is clear (2.4.1), and not more intensely coloured than reference solution YS6 (2.4.1).

Acidity. Mix 1.0 g with 50 ml of *water*, boil for 2 minutes, allow to cool, filter and adjust the volume to 50 ml. To 10 ml of the

filtrate add 0.15 ml of *methyl red solution*; not more than 0.1 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution from orange-yellow to pure yellow.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 5 volumes of *concentrated ammonia*, 15 volumes of *ethanol (95 per cent)* and 80 volumes of *chloroform*.

Test solution. Dissolve about 1.0 g of the substance under examination in 100 ml of *ethanol (95 per cent)*.

Reference solution. Dilute 0.5 ml of the test solution to 100 ml with *ethanol (95 per cent)*.

Apply 20 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine in ultraviolet light at 254 nm. Spray with *diphenylcarbazone mercuric reagent*. Allow the plate to dry in air and spray with freshly prepared *alcoholic potassium hydroxide solution* (20 per cent w/v). Heat at 105° for 5 minutes. Any secondary spot in the chromatogram obtained with the test solution, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent w/w, determined on 1.0 g by drying in an oven at 105° for 2 hours.

Assay. Weigh accurately about 0.1 g, dissolve in 5 ml of *pyridine*, add 0.25 ml of *thymolphthalein solution* and 10 ml of *silver nitrate-pyridine reagent* and titrate with *0.1 M ethanolic sodium hydroxide* until a pure blue colour is obtained. Repeat the operation without the substance under examination. The difference between the titrations represents the amount of sodium hydroxide required.

1 ml of *0.1 M ethanolic sodium hydroxide* is equivalent to 0.01161 g of $C_{12}H_{12}N_2O_3$.

Storage. Store protected from moisture.

Phenobarbitone Tablets

Phenobarbital Tablets

Phenobarbitone Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of phenobarbitone, $C_{12}H_{12}N_2O_3$.

Usual strengths. 15 mg; 30 mg; 60 mg; 100 mg.

Identification

Extract a quantity of the powdered tablets containing about 0.5 g of Phenobarbitone with 50 ml of *ether*, filter through *anhydrous sodium sulphate* and evaporate the ether to dryness on a water-bath. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenobarbitone RS* or with the reference spectrum of phenobarbitone.

B. Dissolve 50 mg in 2 ml of a 0.2 per cent w/v solution of *cobaltous acetate* in *methanol*, warm, add 50 mg of powdered borax and heat to boiling; a bluish violet colour is produced.

Tests

Disintegration (2.5.1). 30 minutes

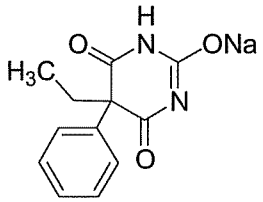
Other tests. Complies with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 0.3 g of Phenobarbitone and extract in a continuous extraction apparatus (2.1.8) with *ether* until complete extraction is effected. Remove the ether and dry the residue, which is $C_{12}H_{12}N_2O_3$, to constant weight at 105°.

Storage. Store protected from moisture.

Phenobarbitone Sodium

Phenobarbital Sodium; Soluble Phenobarbitone; Soluble Phenobarbital



$C_{12}H_{11}N_2NaO_3$ Mol. Wt. 254.2

Phenobarbitone Sodium is sodium 5-ethyl-5-phenylbarbiturate.

Phenobarbitone Sodium contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{12}H_{11}N_2NaO_3$, calculated on the dried basis.

Category. Sedative; anticonvulsant.

Dose. Orally, 60 to 300 mg at night; by intramuscular or intravenous injection, 50 to 200 mg, repeated after 6 hours if necessary; maximum 600 mg daily.

Description. A white powder or crystalline granules or flaky crystals; hygroscopic.

Identification

Test A may be omitted if tests B, C, D, E and F are carried out. Tests C, D and E may be omitted if tests A, B and F are carried out.

A. Dissolve 0.2 g in 20 ml of *ethanol (50 per cent)*, acidify with *dilute hydrochloric acid* and extract with 50 ml of *ether*. Wash the ether layer with 10 ml of *water*, dry over *anhydrous sodium sulphate* and filter. Evaporate the filtrate to dryness and dry the residue at 105°.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenobarbitone RS* or with the reference spectrum of phenobarbitone.

B. Determine the melting point (2.4.21), of the residue obtained in test A and of a mixture of equal quantities of the residue and *phenobarbitone RS*. The difference between the melting points, which are about 175°, is not greater than 2°.

C. Complies with the test for identification of barbiturates (2.3.2), but using the following solutions.

Test solution. A 0.1 per cent w/v solution of the substance under examination in *ethanol (50 per cent)*.

Reference solution. A 0.09 per cent w/v solution of *phenobarbitone RS* in *ethanol (50 per cent)*.

D. 1 g dissolves completely in 20 ml of *ethanol (90 per cent)* (distinction from barbitone sodium).

E. Gives the reaction of non-nitrogen substituted barbiturates (2.3.1).

F. Ignite about 0.1 g; the residue gives the reactions of sodium salts (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *ethanol (50 per cent)* is clear (2.4.1), and not more intensely coloured than reference solution YS7 (2.4.1).

pH (2.4.24). Not more than 10.2, determined in a 10.0 per cent w/v solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 5 volumes of *concentrated ammonia*, 15 volumes of *ethanol (95 per cent)* and 80 volumes of *chloroform*.

Test solution. Dissolve about 1.0 g of the substance under examination in 100 ml of *ethanol (95 per cent)*.

Reference solution. Dilute 0.5 ml of the test solution to 100 ml with *ethanol (95 per cent)*.

Apply 20 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine in ultraviolet light at 254 nm. Spray with *diphenylcarbazone mercuric reagent*. Allow the plate to dry in air and spray with freshly prepared *alcoholic potassium hydroxide solution* (20 per cent w/v). Heat at 105 ° for 5 minutes. Any secondary spot in the chromatogram obtained with the test solution, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Loss on drying (2.4.19). Not more than 7.0 per cent, determined on 0.5 g by drying in an oven at 150° for 4 hours.

Assay. Weigh accurately about 0.15 g, dissolve in 2 ml of *water* and add 8 ml of *0.05 M sulphuric acid*. Heat to boiling and cool. Add 30 ml of *methanol* and shake until dissolution is complete. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). After the first inflection, stop the addition of the *sodium hydroxide*, add 10 ml of *pyridine*, mix and continue the titration until the second inflection is reached. The difference between the volumes represents the amount of sodium hydroxide required.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.02542 g of $C_{12}H_{11}N_2NaO_3$.

Storage. Store protected from moisture.

Phenobarbitone Injection

Phenobarbital Sodium Injection; Phenobarbitone Sodium Injection; Soluble Phenobarbitone Injection

Phenobarbitone Injection is a sterile solution of Phenobarbitone Sodium in a mixture of nine volumes of Propylene Glycol and one volume of Water for Injections.

Phenobarbitone Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of phenobarbitone sodium, $C_{12}H_{11}N_2NaO_3$.

Usual strengths. 30 mg, 60 mg, 65 mg and 130 mg per ml.

Identification

To a volume containing 1 g of Phenobarbitone Sodium add 15 ml of *water* if necessary, make slightly acidic with *1 M sulphuric acid* and filter. The residue, after washing with *water* and drying at 105°, complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenobarbitone RS* or with the reference spectrum of phenobarbitone.

B. Dissolve 50 mg in 2 ml of a 0.2 per cent w/v solution of *cobalt acetate* in *methanol*, warm, add 50 mg of powdered *borax* and heat to boiling; a bluish violet colour is produced.

Tests

pH (2.4.24). 10.0 to 11.0.

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. Weigh accurately about 2.0 g, add 30 ml of *water* and 3 g of *sodium carbonate*, stir to dissolve and titrate with *0.1 M silver nitrate* until a distinct turbidity is observed when viewed against a black background, the solution being stirred vigorously throughout the titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.02542 g of $C_{12}H_{11}N_2NaO_3$.

Determine the weight per ml of the injection (2.4.29) and calculate the percentage weight in volume of $C_{12}H_{11}N_2NaO_3$.

Storage. Store in single dose containers.

Labelling. The label states that the injection should not be used if the solution is discoloured or if it contains a precipitate.

Phenobarbitone Sodium Tablets

Phenobarbital Sodium Tablets; Soluble Phenobarbitone Tablets; Soluble Phenobarbital Tablets

Phenobarbitone Sodium Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of phenobarbitone sodium, $C_{12}H_{11}N_2NaO_3$.

Usual strengths. 30 mg; 60 mg.

Identification

A. Heat 0.1 g of the residue obtained in Assay on a water-bath with 15 ml of *ethanol (25 per cent)* until dissolved, filter while hot and allow to cool. Filter through a sintered-glass crucible, wash with a small quantity of *ethanol (25 per cent)* and dry at 105°. Heat in a sealed tube at 105° for 1 hour.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenobarbitone RS* or with the reference spectrum of phenobarbitone.

B. The residue obtained in test A melts at about 175° (2.4.21).

C. Dissolve 50 mg of the residue obtained in Assay in 2 ml of a 0.2 per cent w/v solution of *cobaltous acetate* in *methanol*, warm, add 50 mg of powdered *borax* and heat to boiling; a bluish violet colour is produced.

D. Triturate a quantity of the powdered tablets containing 0.2 g of Phenobarbitone Sodium with 5 ml of *water* and filter; the filtrate is alkaline to *litmus solution* and yields a white precipitate on the addition of *dilute hydrochloric acid*.

E. The powdered tablets, when moistened with *hydrochloric acid* and introduced on a platinum wire into a flame, impart a yellow colour to the flame.

Tests

Other tests. Complies with the tests stated under Tablets.

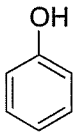
Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 0.3 g of Phenobarbitone Sodium, dissolve as completely as possible in 10 ml of a 2 per cent w/v solution of *sodium hydroxide*, saturate with *sodium chloride*, acidify with *hydrochloric acid* and extract with successive quantities, each of 15 ml, of *ether* until complete extraction is effected. Wash the combined extracts with two quantities, each of 2 ml, of *water* and extract the combined washings with 10 ml of *ether*. Add the ether to the main ether layer and dry the residue to constant weight at 105°.

1 g of the residue is equivalent to 1.095 g of $C_{12}H_{11}N_2NaO_3$.

Storage. Store protected from moisture.

Phenol

Carbolic acid



C_6H_6O Mol. Wt. 94.1

Phenol contains not less than 99.0 per cent and not more than 100.5 per cent of C_6H_6O.

Category. Antiseptic; antipruritic; pharmaceutical aid (antimicrobial preservative).

Description. Colourless or faintly pink or faintly yellowish crystals or crystalline masses; odour, characteristic; deliquescent.

Identification

A. Dissolve 0.5 g in 2 ml of *strong ammonia solution*. Dilute this solution to about 100 ml with *water* and to 2 ml of the resulting solution, add 0.05 ml of 3 per cent w/v solution of *sodium hypochlorite*; a blue colour develops which becomes progressively more intense.

B. Dissolve 1.0 g in sufficient *water* to produce 15 ml (solution A) and to 1 ml, add 10 ml of *water* and 0.1 ml of *ferric chloride*

solution; a violet colour is produced which disappears on the addition of 5 ml of *2-propanol*.

C. To 1 ml of solution A add 10 ml of *water* and 1 ml of *bromine solution*; a pale yellow precipitate is produced.

Tests

Appearance of solution. Solution A is clear (2.4.1), and not more intensely coloured than reference solution BS6 (2.4.1).

Acidity. To 2 ml of solution A add 0.05 ml of *methyl orange solution*; the solution is yellow.

Freezing point (2.4.11). Not less than 39.5°.

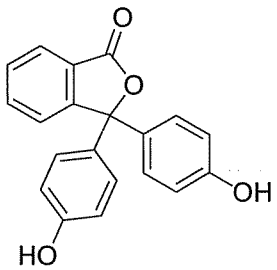
Non-volatile matter. Not more than 0.05 per cent, when 5.0 g is volatilised on a water-bath and dried to constant weight at 105°.

Assay. Weigh accurately about 0.5 g and dissolve in sufficient *water* to produce 250.0 ml. Transfer 25.0 ml to a ground-glass-stoppered flask, add 50.0 ml of *0.05 M bromine* and 5 ml of *hydrochloric acid*, stopper, allow to stand for 30 minutes, swirling occasionally, and allow to stand for a further 15 minutes. Add 5 ml of a 20 per cent w/v solution of *potassium iodide*, shake and titrate with *0.1 M sodium thiosulphate* until a faint yellow colour remains. Add 0.5 ml of *starch solution* and 10 ml of *chloroform* and continue the titration with vigorous shaking. Repeat the operation without the substance under examination. The difference between the titrations represents the amount of bromine required.

1 ml of *0.05 M bromine* is equivalent to 0.001569 g of C_6H_6O.

Storage. Store protected from light and moisture.

Phenolphthalein



$C_{20}H_{14}O_4$ Mol. Wt. 318.3

Phenolphthalein is 3,3-bis(4-hydroxyphenyl)phthalide.

Phenolphthalein contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{20}H_{14}O_4$, calculated on the dried basis.

Category. Laxative.

Dose. 30 to 200 mg.

Description. A white or yellowish white, crystalline or amorphous powder; odourless or almost odourless.

Identification

A. Dissolves in dilute solutions of alkali hydroxides and in hot solutions of alkali carbonates forming a red solution which is decolorised by dilute acids.

B. Dissolve 25 mg in 100 ml of *ethanol (95 per cent)* (solution A). To 2.0 ml of solution A add 5.0 ml of *1 M hydrochloric acid* and dilute to 50.0 ml with *ethanol (95 per cent)* (solution A_1). To 10.0 ml of solution A add 5.0 ml of *1 M hydrochloric acid* and dilute to 50.0 ml with *ethanol (95 per cent)* (solution A_2). To 2.0 ml of solution A add 5.0 ml of *1 M sodium hydroxide* and dilute to 50.0 ml with *ethanol (95 per cent)* (solution B). Examined between 220 nm and 250 nm (2.4.7), solution A_1 shows an absorption maximum at 229 nm. The specific absorbance at the maximum at 229 nm is 922 to 1018. Examined between 250 nm and 300 nm, solution A_2 shows an absorption maximum at 276 nm. The specific absorbance at the maximum at 276 nm is 142 to 158. Examined between 230 nm and 270 nm, solution B shows an absorption maximum at 249 nm. The specific absorbance at the maximum at 249 nm is 744 to 822.

Tests

Solution A. To 2.0 g add 40 ml of *distilled water*, boil, cool and filter.

Appearance of solution. A 4 per cent w/v solution in *ethanol (95 per cent)* is clear (2.4.1) and not more intensely coloured than reference solution YS7 (2.4.1).

Acidity or alkalinity. To 10 ml of solution A, add 0.15 ml of *bromothymol blue solution*. Add 0.05 ml of *0.01 M hydrochloric acid*, the solution is yellow. Add 0.1 ml of *0.01 M sodium hydroxide*, the solution is blue.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel F254*.

Mobile phase. A mixture of 50 volumes of *acetone* and 50 volumes of *dichloromethane*.

Test solution. Dissolve 0.5 g of the substance under examination in 10 ml *ethanol (95 per cent)*.

Reference solution (a). Dilute 1 ml of the test solution to 10 ml with *ethanol (95 per cent)*. Dilute 5 ml of this solution to 100 ml with *ethanol (95 per cent)*.

Reference solution (b). Dissolve 25 mg of *fluorene* in *ethanol (95 per cent)*, add 0.5 ml of the test solution and dilute to 10 ml with *ethanol (95 per cent)*.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine at 254 nm

and re-examine after exposure to ammonia vapour. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

Chlorides (2.3.12). Dilute 10 ml of solution A to 15 ml with *water*. The solution complies with the limit test for chlorides (100 ppm).

Heavy metals (2.3.13). Heat 5 g with 50 ml of *dilute hydrochloric acid* on a water-bath for 5 min and filter. Evaporate the filtrate almost to dryness and dissolve the residue in 50 ml of *water*. 12 ml of this solution complies with the limit test for heavy metals, Method D (20 ppm). Use 10 ml of *lead standard solution (2 ppm Pb)* to prepare the standard.

Sulphates (2.3.17). 15 ml of solution A complies with the limit test for sulphates (200 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

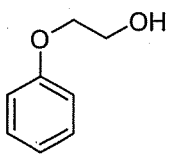
Assay. Dissolve 0.1 g in 5 ml of *dimethylformamide*. Add 5 ml of *sodium carbonate solution*, 10 ml of *sodium hydrogen carbonate solution*, 35 ml of *water* and 50.0 ml of *0.05 M iodine*. Add 10 ml of *dichloromethane* and 20 ml of *dilute sulphuric acid*. Titrate the excess of iodine with *0.1 M sodium thiosulphate*, using 0.3 ml of *starch solution* added towards the end of the titration, as indicator. Carry out a blank titration.

1 ml of *0.05 M iodine* is equivalent to 0.003979 g of $C_{20}H_{14}O_4$.

Storage. Store protected from moisture.

Phenoxyethanol

2-Phenoxyethanol



$C_8H_{10}O_2$ Mol. Wt.138.2

Phenoxyethanol is 1-hydroxy-2-phenoxyethane.

Phenoxyethanol contains not less than 99.0 per cent and not more than 100.5 per cent of $C_8H_{10}O_2$, calculated on the dried basis.

Category. Pharmaceutical aid.

Description. A colourless, slightly viscous liquid.

Identification

Shake 2 ml of Phenoxyethanol with a mixture of 4.0 g of *potassium permanganate*, 5.4 g of *sodium carbonate* and 75 ml of *water* for 30 minutes. Add 25 g of *sodium chloride* and stir continuously for 60 minutes, filter and adjusted to pH 1.7 with *hydrochloric acid*. The precipitate, after recrystallisation from *water* complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenoxyethanol RS* or with the reference spectrum of phenoxyethanol.

B. When examined in the range 240 nm to 350 nm (2.4.7), a 0.008 per cent w/v solution in *water*, shows two absorption maxima at 269 nm and 275 nm and specific absorbance at 269 nm is 95 to 105 and at 275 nm is 75 to 85.

Tests

Refractive index (2.4.27). 1.537 to 1.539

Relative density (2.4.29). 1.105 to 1.110

Related substances. Determine by Gas chromatography (2.4.13).

Internal standard solution. Dissolve 1.25 g of *methyl laurate* in 25.0 ml of *dichloromethane*.

Test solution. Dissolve 5 g of the substance under examination in 10.0 ml of *dichloromethane* and add 1.0 ml of the internal standard solution.

Reference solution. Add 10.0 ml of the internal standard solution to 1.0 ml of the test solution and dilute to 100.0 ml with *dichloromethane*.

Chromatographic system

- a glass column 1.5 m x 4 mm, packed with silanised diatomaceous earth support (150 to 180 mesh) coated with 3 per cent w/w solution of polymethylphenyl-siloxane,
- temperature:
  column. 130°,
  inlet port and detector at 200°,
- flame ionization detector,
- flow rate. 30 ml per minute using nitrogen as a carrier gas.

Inject 1 µl of the reference solution. The test is not valid unless the resolution between the peaks due to phenoxyethanol and methyl laurate is not less than 12.

Inject 1 µl of the test solution and the reference solution. In the chromatogram obtained with the test solution, the ratio of the area due to peak corresponding to phenoxyethanol to the area of the peak due to the internal standard from the chromatogram obtained with the reference solution. from the

chromatogram obtained with test solution, the ratio of the area of the sum of any secondary peak and the peak due to the internal standard, is not more than 1.0 per cent.

Phenol. Not more than 0.1 per cent.

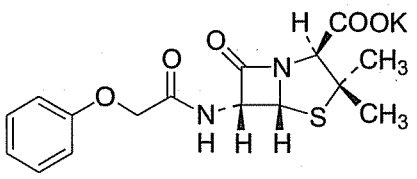
Shake about 1 g of *propoxyphenol* in 50 ml of *dichloromethane* with 1 ml of dilute *sodium hydroxide solution* and 10 ml of *water*. Wash the upper layer with 2 quantities, each of 20 ml of *dichloromethane* and dilute to 100.0 ml with *water*. The absorbance at the maxima at 287 nm (2.4.7) is not more than 0.27.

Assay. Weigh accurately 2 g, dissolve in 10.0 ml of freshly prepared *acetic anhydride solution,* heat in a water bath for 45 minutes. Cool, add 10.0 ml of *water*. further heat for 2 minutes, cool and add 10.0 ml of *butanol*, shake vigorously and titrate excess of *acetic acid* with *1 M sodium hydroxide* using 0.2 ml of *phenolphthalein* solution as indicator. Carry out a blank titration.

1 ml of *1 M sodium hydroxide* is equivalent to 0.1382 g of $C_8H_{10}O_2$.

Phenoxymethylpenicillin Potassium

Penicillin V Potassium



$C_{16}H_{17}KN_2O_5S$ Mol. Wt. 388.5

Phenoxymethylpenicillin Potassium is potassium (6*R*)-6-(2-phenoxyacetamido)penicillinate, produced by the growth of certain strains of *Penicillium notatum* or related organisms on a culture medium containing an appropriate precursor, or obtained by any other means.

Phenoxymethylpenicillin Potassium contains not less than 86.0 per cent of total penicillins $C_{16}H_{17}N_2O_5S$, calculated on the anhydrous basis.

Category. Antibacterial.

Dose. For an adult, the equivalent of 250 to 500 mg of phenoxymethylpenicillin every 6 hours, at least 30 minutes before food. For a child every 6 hours, upto 1 year, 62.5 mg; 1 to 5 years, 125 mg; and 6 to 12 years, 250 mg.

Description. A white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Test B may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenoxymethylpenicillin potassium RS.*

B. Gives reaction B of penicillins and cephalosporins (2.3.1).

C. Gives reaction A of potassium salts (2.3.1).

Tests

pH (2.4.24). 5.5 to 7.5, determined in a 0.5 per cent w/v solution.

Specific optical rotation (2.4.22). +215.0° to +230.0°, determined in a 1.0 per cent w/v solution in *carbon dioxide-free water.*

Light absorption (2.4.7). Absorbance of a 0.1 per cent w/v solution in *0.1 M sodium hydroxide* at the maximum at about 306 nm, not more than 0.33. Absorbance of a 0.02 per cent w/v solution in *0.1M sodium hydroxide* at the maximum at about 274 nm, not less than 0.50.

Phenoxyacetic acid. Not more than 0.5 per cent.

Determine by liquid chromatography (2.4.14).

Test solution. Weigh accurately a suitable quantity of the substance under examination, dissolve in *phosphate buffer pH 6.6* and dilute to obtain a solution having a known concentration of about 20 mg per ml.

Reference solution. Weigh accurately a suitable quantity of phenoxyacetic acid, dissolve in the *phosphate buffer pH 6.6* and dilute to obtain a solution having a known concentration of about 0.1 mg per ml.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane chemically bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of *water*, 35 volumes of *acetonitrile* and 1 volume of *glacial acetic acid*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Inject the reference solution. The tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject alternately the test solution and the reference solution.

Calculate the content of phenoxyacetic acid.

Limit of *p*-hydroxyphenoxymethylpenicillin. Not more than 5.0 per cent.

Using the chromatograms obtained with the test solution in the Assay, calculate the content of *p*-hydroxyphenoxymethylpenicillin from the peak response of *p*-hydroxyphenoxymethylpenicillin and the sum of the peak responses of *p*-hydroxyphenoxymethylpenicillin and phenoxymethylpenicillin.

Water (2.3.43). Not more than 1.0 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 125 mg of the substance under examination in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve an accurately weighed quantity of *phenoxymethylpenicillin potassium RS* in the mobile phase and dilute to obtain a solution having a known concentration of about 2.5 mg per ml.

Reference solution (b). A solution in the mobile phase containing 0.25 per cent w/v each of benzylpenicillin potassium and phenoxymethylpenicillin potassium.

Chromatographic system
- a stainless steel column 30 cm x 4 mm, packed with octadecylsilane chemically bonded to porous silica (3 to 10 µm),
- mobile phase: a mixture of 65 volumes of *water*, 35 volumes of *acetonitrile* and 5.75 volumes of *glacial acetic acid*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 10 µl.

Inject reference solution (b).The relative retention times are about 0.8 for benzylpenicillin and 1.0 for phenoxymethylpenicillin. The column efficiency determined from the phenoxymethylpenicillin peak is not less than 1800 theoretical plates and the resolution between benzylpenicillin and phenoxymethylpenicillin is not less than 3.0.

Inject reference solution (a). The relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the test solution and reference solution (a). Record the chromatograms and measure the responses for the phenoxymethylpenicillin peak and any *p*-hydroxyphenoxymethylpenicillin peak with a retention time of about 0.4 relative to that of the main phenoxymethylpenicillin peak.

Calculate the content of $C_{16}H_{17}N_2O_5S$, from the sum of the peak responses of the *p*-hydroxyphenoxymethylpenicillin and phenoxymethylpenicillin peaks in the chromatograms obtained with the test solution and reference solution (a).

Storage. Store protected from moisture.

Phenoxymethylpenicillin Potassium Tablets

Phenoxymethylpenicillin Tablets; Penicillin V Potassium Tablets; Penicillin V Tablets

Phenoxymethylpenicillin Potassium Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of phenoxymethylpenicillin, $C_{16}H_{18}N_2O_5S$.

Usual strengths. The equivalent of 62.5 mg, 125 mg, 250 mg and 500 mg of phenoxymethylpenicillin.

Identification

A. Shake a quantity of the powdered tablets containing 80 mg of phenoxymethylpenicillin with *water*, dilute to 250 ml with *water* and filter. When examined between 230 and 360 nm (2.4.7), the filtrate shows absorption maxima at about 268 nm and 274 nm and a minimum at about 272 nm.

B. Shake a quantity of the powdered tablets containing 10 mg of phenoxymethylpenicillin with 10 ml of *water*, filter and add 0.5 ml of *neutral red solution*. Add sufficient *0.01 M sodium hydroxide* to produce a permanent orange colour and then add 1.0 ml of *penicillinase solution*; the solution changes rapidly to red.

C. Ignite 0.5 g of the powdered tablets, add 5 ml of *2 M hydrochloric acid*, boil, cool and filter. The filtrate gives reaction B of potassium salts (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 1,
Medium. 900 ml of *water*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted if necessary, at the maximum at about 268 nm (2.4.7). At the same time measure the absorbance of a solution of known concentration of *phenoxymethylpenicillin potassium RS* at the maximum at about 268 nm. Calculate the content of $C_{16}H_{18}N_2O_5S$, in the medium.

D. Not less than 75 per cent of the stated amount of $C_{16}H_{18}N_2O_5S$.

Other tests. Complies with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and finely powder 20 tablets. Dissolve an accurately weighed quantity of the powder containing about 0.25 g of phenoxymethylpenicillin in the mobile phase by shaking for 5 minutes and dilute to 100.0 ml with the mobile phase. Filter through a 0.5 µm or finer filter and use the filtrate.

Reference solution (a). Dissolve an accurately weighed quantity of *phenoxymethylpenicillin potassium RS* in the mobile phase and dilute to obtain a solution having a known concentration of about 2.5 mg per ml.

Reference solution (b). A solution in the mobile phase containing 0.25 per cent w/v each of benzylpenicillin potassium and phenoxymethylpenicillin potassium.

Chromatographic system

- a stainless steel column 30 cm x 4 mm, packed with octadecylsilane chemically bonded to porous silica,
- mobile phase: a mixture of 650 volumes of *water*, 350 volumes of *acetonitrile* and 5.75 volumes of *glacial acetic acid*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 10 µl.

Inject reference solution (b).The relative retention times are about 0.8 for benzylpenicillin and 1.0 for phenoxymethylpenicillin. The column efficiency determined from the phenoxymethylpenicillin peak is not less than 1800 theoretical plates and the resolution between the benzylpenicillin and phenoxymethylpenicillin peaks is not less than 3.0.

Inject reference solution (b). The relative standard deviation for replicate injections is not more than 1.0 per cent.

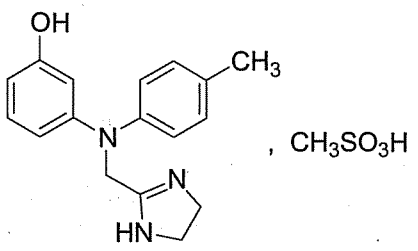
Inject the test solution and reference solution (a). Record the chromatograms and measure the responses for the phenoxymethylpenicillin peak and any *p*-hydroxyphenoxymethylpenicillin peak with a retention time of about 0.4 relative to that of the main phenoxymethylpenicillin peak.

Calculate the content of $C_{16}H_{17}N_2O_5S$, from the sum of the peak responses of the *p*-hydroxyphenoxymethylpenicillin and phenoxymethylpenicillin peaks in the chromatograms obtained with the test solution and reference solution (a)

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the equivalent amount of phenoxymethylpenicillin.

Phentolamine Mesylate



$C_{17}H_{19}N_3O,CH_4O_3S$ Mol. Wt. 377.5

Phentolamine Mesylate is 3-[[4,5-dihydro-1*H*-imidazol-2-yl)methyl](4-methylphenyl)aminophenol methanesulphonate.

Phentolamine Mesylate contains not less than 99.0 per cent and not more than 100.5 per cent of $C_{17}H_{19}N_3O$, CH_4O_3S, calculated on the dried basis.

Category. Alpha-adrenoceptor antagonist.

Dose. By intravenous injection, 5 to 10 mg.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phentolamine mesylate RS* or with the reference spectrum of phentolamine mesylate.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.002 per cent w/v solution shows an absorption maximum only at about 278 nm; absorbance at about 278 nm, about 0.5.

C. Dissolve 0.5 g in 5 ml of *ethanol (95 per cent)* and 5 ml of *0.1 M hydrochloric acid* and add 2 ml of a 0.5 per cent w/v solution of *ammonium metavanadate*; a light green precipitate is produced.

D. Mix 50 mg with 0.2 g of powdered *sodium hydroxide*, heat to fusion and continue the heating for a few seconds longer. Cool, add 0.5 ml of *water* and a slight excess of *2 M hydrochloric acid* and warm; *sulphur dioxide* is evolved, which turns moistened starch iodate paper blue.

Tests

Acidity or alkalinity. Dissolve 0.1 g in 10 ml of *carbon dioxide-free water* and add 0.1 ml of *methyl red solution*. The solution is not red and not more than 0.05 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 85 volumes of *2-butanone*, 15 volumes of *acetone* and 5 volumes of *strong ammonia solution*.

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of *ethanol (95 per cent)*.

Reference solution. A 0.01 per cent w/v solution of the substance under examination in *ethanol (95 per cent)*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air, spray with *dilute potassium iodobismuthate solution*. Any secondary spot in the

chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.3 g and dissolve in 100 ml of *anhydrous 2-propanol* with the aid of ultrasound if necessary. Titrate with *0.1 M tetrabutylammonium hydroxide* in *2-propanol*. Determine the end-point potentiometrically (2.4.25), using a glass electrode and a calomel electrode containing a saturated solution of *tetramethylammonium chloride* in *2-propanol*. Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.03775 g of $C_{17}H_{19}N_3O, CH_4O_3S$.

Storage. Store protected from light and moisture.

Phentolamine Injection

Phentolamine Mesylate Injection

Phentolamine Injection is a sterile solution of Phentolamine Mesylate in Water for Injections containing Dextrose.

Phentolamine Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of phentolamine mesylate, $C_{17}H_{19}N_3O, CH_4O_3S$.

Usual strength. 10 mg per ml.

Identification

The residue obtained in the Assay melts at about 138° (2.4.21).

Tests

pH (2.4.24). 3.5 to 5.0.

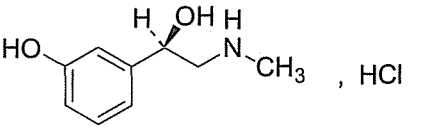
Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. Dilute an accurately measured volume containing about 0.1 g of Phentolamine Mesylate to 40 ml with *water*, add 20 ml of a 20 per cent w/v solution of *trichloroacetic acid*, allow to stand for 3 hours, filter, wash the residue with two quantities, each of 5 ml, of *water* and dry to constant weight at 105°.

1 g of the residue is equivalent to 0.8487 g of $C_{17}H_{19}N_3O, CH_4O_3S$.

Storage. Store protected from light.

Phenylephrine Hydrochloride



$C_9H_{13}NO_2,HCl$ Mol. Wt. 203.7

Phenylephrine Hydrochloride is (*R*)-1-(3-hydroxyphenyl)-2-methylaminoethanol hydrochloride.

Phenylephrine Hydrochloride contains not less than 98.5 per cent and not more than 101.0 per cent of $C_9H_{13}NO_2$, HCl, calculated on the dried basis.

Category. Sympathomimetic.

Dose. By subcutaneous or intramuscular injection, 2 to 5 mg; by slow intravenous injection, 100 to 500 µg; by intravenous infusion 5 to 20 mg in 500 ml, adjusted according to response.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenylephrine hydrochloride RS* or with the reference spectrum of phenylephrine hydrochloride.

B. Dissolve about 10 mg in 1 ml of *water* and add 0.05 ml of *cupric sulphate solution* and 1 ml of *5 M sodium hydroxide*; a violet colour is produced. Add 1 ml of *ether* and shake; the ether layer remains colourless.

C. Dissolve 0.3 g in 3 ml of *water*, add 1 ml of *6 M ammonia* and initiate crystallisation by scratching the side of the tube with a glass rod. The melting range of the crystals, after washing with iced *water* and drying at 105° for 2 hours, is 171° to 176° (2.4.21).

D. Gives reaction A of chlorides (2.3.1).

Tests

Appearance of solution. Dissolve 2.0 g in 100 ml of *carbon dioxide-free water* prepared from *distilled water* (solution A). Solution A is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. To 10 ml of solution A add 0.1 ml of *methyl red solution* and 0.2 ml of *0.01 M sodium hydroxide*. The solution is yellow and not more than 0.4 ml of *0.01 M hydrochloric acid* is required to change the colour of the solution to red.

Specific optical rotation (2.4.22). –43.0° to –47.0°, determined in solution A.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H.*

Mobile phase. A mixture of 80 volumes of *2-propanol*, 15 volumes of *10 M ammonia* and 5 volumes of *chloroform.*

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of *methanol.*

Reference solution (a). A 0.01 per cent w/v solution of the substance under examination in *methanol.*

Reference solution (b). A 0.004 per cent w/v solution of the substance under examination in *methanol.*

Apply to the plate 5 µl of each solution. After development, dry the plate in cold air, spray with *ninhydrin solution*, heat at 105° for 10 minutes and examine in daylight. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than two such spots are more intense than the spot in the chromatogram obtained with reference solution (b).

Sulphates (2.3.17). 15 ml of solution A complies with the limit test for sulphates (500 ppm).

Phenones. To 10 ml of solution A add sufficient *0.01 M hydrochloric acid* to produce 50 ml. Absorbance of the resulting solution at the maximum at about 310 nm, not more than 0.20 (2.4.7).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.15 g, dissolve in a mixture of 0.5 ml of *0.1 M hydrochloric acid* and 80 ml of *ethanol (95 per cent)* and titrate with *0.1 M ethanolic sodium hydroxide* determining the end-point potentiometrically (2.4.25). Record the volume added between the two inflections.

1 ml of *0.1 M ethanolic sodium hydroxide* is equivalent to 0.02037 g of $C_9H_{13}NO_2$,HCl.

Storage. Store protected from light and moisture.

Phenylephrine Injection

Phenylephrine Hydrochloride Injection

Phenylephrine Injection is a sterile solution of Phenylephrine Hydrochloride in Water for Injections.

Phenylephrine Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of phenylephrine hydrochloride, $C_9H_{13}NO_2$,HCl.

Usual strength. 10 mg per ml.

Identification

A. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (b).

B. To a volume containing 10 mg of Phenylephrine Hydrochloride add, if necessary, sufficient *water* to produce 1 ml and then add 0.05 ml of *cupric sulphate solution* and 1 ml of *5 M sodium hydroxide*; a violet colour is produced. Add 1 ml of *ether* and shake; the ether layer remains colourless.

C. Gives reaction A of chlorides (2.3.1).

Tests

pH (2.4.24). 4.5 to 6.5.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H.*

Mobile phase. A mixture of 80 volumes of *2-propanol*, 15 volumes of *10 M ammonia* and 5 volumes of *chloroform.*

Test solution (a) Evaporate a volume of the injection containing 20 mg of Phenylephrine Hydrochloride to dryness and dissolve the residue in 1 ml of *methanol.*

Test solution (b). Dilute 1 volume of test solution (a) to 200 volumes with *methanol.*

Reference solution (a). Dilute 1 volume of test solution (b) to 2.5 volumes with *methanol.*

Reference solution (b). A 0.01 per cent w/v solution of *phenylephrine hydrochloride RS* in *methanol.*

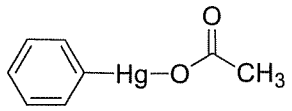
Apply to the plate 5 µl of each solution. After development, dry the plate in cold air, spray with *ninhydrin solution*, heat at 105° for 10 minutes and examine in daylight. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with test solution (b) and not more than two such spots are more intense than the spot in the chromatogram obtained with reference solution (a).

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. To an accurately measured volume containing about 50 mg of Phenylephrine Hydrochloride add sufficient *0.5 M sulphuric acid* to produce 100.0 ml. Dilute 10.0 ml of this solution to 100.0 ml with *0.5 M sulphuric acid* and measure the absorbance of the resulting solution at the maximum at about 273 nm (2.4.7). Calculate the content of $C_9H_{13}NO_2$,HCl taking 90 as the specific absorbance at 273 nm.

Storage. Store protected from light.

Phenylmercuric Acetate



$C_8H_8HgO_2$ Mol. Wt. 336.7

Phenylmercuric Acetate is (acetato)phenylmercury.

Phenylmercuric Acetate contains not less than 98.0 per cent and not more than 100.5 per cent of $C_8H_8HgO_2$.

Category. Pharmaceutical aid (antimicrobial preservative).

Description. A white to creamy white, crystalline powder, or small white prisms or leaflets.

Identification

A. To 100 mg add 0.5 ml of *nitric acid*, warm gently until a dark brown colour is produced and dilute with *water* to 10 ml; the characteristic odour of *nitrobenzene* is produced.

B. To 100 mg add 0.5 ml of *sulphuric acid* and 1 ml of *ethanol (95 per cent)* and warm; the characteristic odour of *ethyl acetate* is produced.

C. To 5 ml of a saturated solution in *water*, add a few drops of a freshly prepared 10 per cent w/v solution of *sodium sulphide*; a white precipitate is formed which darkens slowly on boiling and allowing to stand.

Tests

Mercuric salts and heavy metals. Heat about 100 mg with 15 ml of *water*, cool and filter. To the filtrate add a few drops of a freshly prepared 10 per cent w/v solution of *sodium sulphide*; the precipitate formed shows no immediate colour.

Polymercurated benzene compounds. Shake 2.0 g with 100 ml of *acetone*. Filter, wash the residue with successive portions of *acetone* until a total of 50 ml is used, dry the residue at 105° for 1 hour and weigh. The weight of the residue does not exceed 30 mg (1.5 per cent).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Assay. Weigh accurately about 0.4 g, transfer to a 100-ml flask, add 15 ml of *water*, 5 ml of *formic acid* and 1 g of *zinc dust* and reflux for 30 minutes. Cool, filter and wash the filter paper and the amalgam with *water* until the washings are no longer acidic to litmus. Dissolve the amalgam in 40 ml of *8 M nitric acid*. Heat on a *water*-bath for 3 minutes and add 0.5 g *urea* and sufficient *0.02 M potassium permanganate* to produce a permanent pink colour. Cool and add *hydrogen peroxide solution* to decolorise the solution. Add 1 ml of *ferric ammonium sulphate solution* and titrate with *0.1 M ammonium thiocyanate*. Repeat the operation without the substance under examination. The difference between the titrations represents the amount of ammonium thiocyanate required.

1 ml of *0.1 M ammonium thiocyanate* is equivalent to 0.01684 g of $C_8H_8HgO_2$.

Storage. Store protected from light and moisture.

Phenylmercuric Nitrate

Phenylmercuric Nitrate is a mixture of phenylmercuric nitrate, $C_6H_5HgNO_3$ and phenylmercuric hydroxide, C_6H_5HgOH.

Phenylmercuric Nitrate contains not less than 62.5 per cent and not more than 63.5 per cent of mercury, Hg, calculated on the dried basis.

Category. Antiseptic; pharmaceutical aid (antimicrobial preservative).

Description. A white or pale yellow powder.

Identification

A. To 0.1 g add 3 ml of *sulphuric acid*; the mixture becomes yellow and the characteristic odour of *nitrobenzene* is produced.

B. To 0.1 g add 45 ml of *water* and heat to boiling with shaking. Cool, filter and add sufficient *water* to produce 50 ml (solution A). To 1 ml of solution A add 1 ml of *2 M hydrochloric acid*; a white, flocculent precipitate is produced.

C. To 5 ml of solution A add 8 ml of *water* and 0.1 ml of a freshly prepared 10 per cent w/v solution of *sodium sulphide*; a white precipitate is formed which darkens slowly on boiling and allowing to stand.

D. To 5 ml of solution A add 1 ml of *2 M hydrochloric acid*, 2 ml of *dichloromethane* and 0.2 ml of *dithizone solution* and shake; the lower layer is orange-yellow.

E. Solution A gives reaction of nitrates (2.3.1).

Tests

Appearance of solution. Solution A is colourless (2.4.1).

Inorganic mercuric compounds. To a 10 ml of solution A add 2 ml of *potassium iodide solution* and 3 ml of *2 M hydrochloric acid* and filter; the filtrate is colourless. Wash the precipitate with 2 ml of *water*, combine the filtrate and washings and add 2 ml of *2 M sodium hydroxide* and sufficient *water* to produce 20 ml. 12 ml of the solution complies with the limit test for heavy metals, Method A (2.3.13). Use *lead standard solution (1 ppm Pb)* to prepare the standard (0.1 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

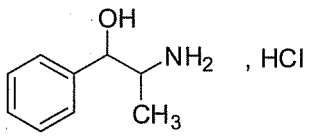
Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* at a pressure of 1.5 to 2.5 kPa for 24 hours.

Assay. Weigh accurately about 0.2 g and dissolve in a mixture of 90 ml of *water* and 10 ml of *nitric acid*. Add 2 ml of *ferric ammonium sulphate solution* and titrate with *0.1 M ammonium thiocyanate* until a persistent reddish yellow colour is obtained. Repeat the operation without the substance under examination. The difference between the titrations represents the amount of *ammonium thiocyanate* required.

1 ml of *0.1 M ammonium thiocyanate* is equivalent to 0.02006 g of Hg.

Storage. Store protected from light and moisture.

Phenylpropanolamine Hydrochloride



$C_9H_{13}NO,HCl$ Mol. Wt. 187.7

Phenylpropanolamine Hydrochloride is (1*RS*,2*SR*)-2-amino-1-phenylpropan-1-ol hydrochloride.

Phenylpropanolamine Hydrochloride contains not less than 99.0 per cent and not more than 101.5 per cent of $C_9H_{13}NO,HCl$, calculated on the dried basis.

Category. Adrenoreceptor antagonist.

Description. A white or almost white crystalline powder.

Identification

Tests A and E may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if tests A and E are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenylpropanolamine hydrochloride RS* or with the reference spectrum of phenylpropanolamine hydrochloride.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

C. To a 1.0 per cent w/v solution of the substance under examination in the *water*, add 0.2 ml of *copper sulphate solution* and 0.3 ml of *dilute sodium hydroxide solution*. A violet colour develops. Add 2 ml of *ether* and shake. A violet precipitate is formed between the two layers.

D. Melting range (2.4.21). 194° to 197°.

E. Gives reaction A of chlorides (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *water* is clear (2.4.1) and colourless (2.4.1).

Acidity or alkalinity. To 10 ml of 5.0 per cent w/v solution in *water*, add 0.1 ml of *methyl red solution* and 0.2 ml of *0.01 M sodium hydroxide*. The solution turns yellow. Add 0.4 ml of *0.01 M hydrochloric acid*. The solution turns red.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H*.

Mobile phase. A mixture of 6 volumes of *13.5 M ammonia*, 24 volumes of *ethanol (95 per cent)* and 70 volumes of *butanol*.

Test solution (a). Dissolve 0.2 g of the substance under examination in 10 ml of *ethanol (95 per cent)*.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10.0 ml with *ethanol (95 per cent)*.

Reference solution (a). Dissolve 20 mg of *phenylpropanolamine hydrochloride RS* in 10 ml of *ethanol (95 per cent)*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 10.0 ml with *ethanol (95 per cent)*.

Reference solution (c). Dissolve 20 mg of *norpseudoephedrine hydrochloride RS* in *ethanol (95 per cent)*, add 1 ml of test solution (a) and dilute to 10 ml with *ethanol (95 per cent)*.

Reference solution (d). Dissolve 60 mg of *ammonium chloride* in 10 ml of the *methanol*.

Before use, spray the plate with a 2 per cent w/v solution of *disodium tetraborate*, using 8 ml for a plate 100 mm by 200 mm and dry in a stream of cold air for 30 minutes. Apply to the plate 10 µl of each solution as bands about 10 mm by 3 mm. Allow the mobile phase to rise 10 cm. Dry the plate in a current of warm air, allow to cool, spray with a 0.2 per cent w/v solution of *ninhydrin* in *ethanol (95 per cent)* and heat at 110° for 15 minutes. Any spot in the chromatogram obtained with test solution (a) other than the principal spot and the spot corresponding to ammonium chloride is not more intense than the spot in the chromatogram obtained with reference solution (b) (1.0 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Phenylpropanonamine. Absorbance of a 2.0 per cent w/v solution in *0.01 M hydrochloric acid* at the maximum at about 283 nm (2.4.7) is not more than 0.1.

Heavy metals (2.3.13). 12 ml of 5.0 per cent w/v solution in *water* complies with the limit test for heavy metals, Method D (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

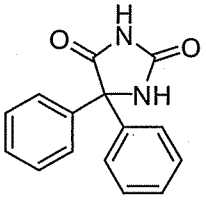
Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.15 g and dissolve in a mixture of 5 ml of *0.01 M hydrochloric acid* and 50 ml of *ethanol (95 per cent)*. Titrate with *0.1 M sodium hydroxide*. Determine the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01877 g of $C_9H_{14}ClNO$.

Phenytoin

Diphenylhydantoin



$C_{15}H_{12}N_2O_2$ Mol.Wt. 252.3

Phenytoin is 5,5-diphenylimidazolidine-2,4-dione.

Phenytoin contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{15}H_{12}N_2O_2$, calculated on the dried basis.

Category. Anticonvulsant.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenytoin RS* or with the reference spectrum of phenytoin.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

C. To about 10 mg, add 1 ml of *water* and 0.05 ml of *ammonia*. Heat until boiling begins. Add 0.05 ml of a 5 per cent w/v solution of *copper sulphate* in *dilute ammonia* and shake, a pink crystalline precipitate is formed.

Tests

Appearance of solution. Dissolve 1.0 g in a mixture of 5 ml of *1 M sodium hydroxide* and 20 ml of *water*. The solution is clear (2.4.1) and not more intensely coloured than reference solution BYS5 (2.4.1).

Acidity or alkalinity. To 1.0 g, add 45 ml of *water* and boil for 2 minutes. Allow to cool and filter. Wash the filter with *carbon dioxide-free water* and dilute the combined filtrate and washings to 50 ml with the same solvent. To 10 ml of the solution add 0.15 ml of *methyl red solution*; not more than 0.5 ml of *0.01 M hydrochloric acid* is required to change the colour of the solution to red. To 10 ml of the solution add 0.15 ml of *bromothymol blue solution*; not more than 0.5 ml of *0.01 M sodium hydroxide* is required to change the colour of the solution to blue.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Solvent mixture. Equal volumes of *acetone* and *methanol*.

Mobile phase. A mixture of 30 volumes of *dioxan* and 75 volumes of *hexane*.

Test solution (a). Dissolve 0.4 g of the substance under examination in 10 ml of the solvent mixture.

Test solution (b). Dilute 1 ml of test solution (a) to 20 ml with the solvent mixture.

Reference solution (a). Dissolve 20 mg of *phenytoin RS* in 10 ml of the solvent mixture.

Reference solution (b). Dissolve 8 mg of *benzophenone* in 100 ml of the solvent mixture.

Reference solution (c). Dissolve 8 mg of *benzil* in 100 ml of the solvent mixture.

Reference solution (d). Dilute 1 ml of test solution (a) to 100 ml with the solvent mixture.

Reference solution (e). Mix 1 ml of reference solution (b) and 1 ml of reference solution (c).

Before use, wash the plate with a mixture of 30 volumes of *dioxan* and 75 volumes of *hexane*. Allow the plate to dry in air. Apply to the plate 10 µl of each solution. Dry the plate in a current of cold air for 2 minutes. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine under ultraviolet light at 254 nm. In the chromatogram obtained with test solution (a) any spot corresponding to benzophenone is not more intense than the spot in the chromatogram obtained with the reference solution (b) (0.2 per cent); any spot corresponding to benzil is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.2 per cent) and any spot, apart from the principal spot and any spot corresponding to benzophenone and benzil, is not more intense than the spot in the chromatogram obtained with reference solution (d) (1 per

cent). The test is not valid unless the chromatogram obtained with reference solution (e) shows two clearly separated spots.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method D (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

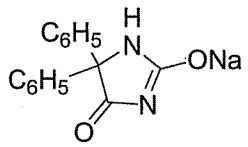
Assay. Weigh accurately about 0.2 g, dissolve in 50 ml of *dimethylformamide*. Titrate with *0.1 M sodium methoxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium methoxide* is equivalent to 0.02523 g of $C_{15}H_{12}N_2O_2$.

Storage. Store protected from light.

Phenytoin Sodium

Diphenylhydantoin Sodium



$C_{15}H_{11}N_2NaO_2$ Mol. Wt. 274.3

Phenytoin Sodium is 4-oxo-5,5-diphenyl-2-imidazolidin-2-olate

Phenytoin Sodium contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{15}H_{11}N_2NaO_2$, calculated on the anhydrous basis.

Category. Anticonvulsant; antiarrhythmic.

Dose. As anticonvulsant, orally, 150 to 300 mg daily, increasing gradually to 600 mg in accordance with the needs of patient. In status epileptieus, by slow intravenous injection, 10 to 15 mg per kg at a rate not exceeding 50 mg per minute as a loading dose; maintenance doses of 100 mg thereafter every 6 hours. In arrhythmias, by intravenous injection, 3.5 to 5 mg per kg at a rate not exceeding 50 mg per minute and repeated once if necessary.

Description. A white powder; odourless; somewhat hygroscopic.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenytoin sodium RS* or with the reference spectrum of phenytoin sodium.

B. Dissolve 0.25 g in 5 ml of *water* and acidify with *dilute hydrochloric acid*; a white precipitate is produced.

C. Dissolve 0.1 g in 10 ml of a 10 per cent w/v solution of *pyridine*, add 1 ml of *cupric sulphate with pyridine solution* and allow to stand for 10 minutes; a blue precipitate is produced.

D. Incinerate 0.1 g; the residue after neutralisation with *hydrochloric acid* and addition of 2 ml of *water* gives the reactions of sodium salts (2.3.1).

Tests

Appearance of solution. Suspend 1.0 g in 5 ml of *water* and dilute to 20 ml with *0.1 M sodium hydroxide*; the solution is clear (2.4.1), and not more intensely coloured than reference solution BYS6 (2.4.1).

Free phenytoin. Dissolve 0.3 g in 10 ml of a mixture of equal volumes of *pyridine* and *water* and add 0.5 ml of *dilute phenolphthalein solution* and 3 ml of *silver nitrate-pyridine reagent*. Not more than 1.0 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution to pink.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 45 volumes of *chloroform*, 45 volumes of *2-propanol* and 10 volumes of *strong ammonia solution*.

Test solution. Dissolve 0.4 g of the substance under examination in 10 ml of *methanol*.

Reference solution (a). A 0.04 per cent w/v solution of the substance under examination in *methanol*.

Reference solution (b). A 0.02 per cent w/v solution of *benzophenone* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate at 80° for 5 minutes and examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and any spot corresponding to benzophenone is not more intense than the spot in the chromatogram obtained with reference solution (b).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Water (2.3.43). Not more than 3.0 per cent, determined on 1.0 g.

Assay. Weigh accurately about 0.18 g, suspend in 2 ml of *water*, add 8 ml of *0.05 M sulphuric acid* and heat gently for 1 minute. Add 30 ml of *methanol*, cool. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). After the first inflection, stop the addition of sodium hydroxide, add 5 ml of *silver nitrate*

solution in *pyridine*, mix and continue the titration until a second inflection is reached. Record the volume of *0.1 M sodium hydroxide* added between the two inflections.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.02743 g of $C_{15}H_{11}N_2NaO_2$.

Storage. Store protected from moisture.

Phenytoin Injection

Phenytoin Sodium Injection; Diphenylhydantoin Sodium injection

Phenytoin Injection is a sterile material consisting of Phenytoin Sodium with or without buffering agents and other excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injection or other suitable solvent, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Phenytoin Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of phenytoin sodium, $C_{15}H_{11}N_2NaO_2$.

Usual strengths. 100 mg; 250 mg.

Description. A white powder; odourless; somewhat hygroscopic.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenytoin sodium RS* or with the reference spectrum of phenytoin sodium.

B. Dissolve 0.25 g in 5 ml of *water* and acidify with *dilute hydrochloric acid*; a white precipitate is produced.

C. Dissolve 0.1 g in 10 ml of a 10 per cent w/v solution of *pyridine*, add 1 ml of *cupric sulphate with pyridine solution* and allow to stand for 10 minutes; a blue precipitate is produced.

D. Incinerate 0.1 g; the residue after neutralisation with *hydrochloric acid* and addition of 2 ml of *water* gives the reactions of sodium salts (2.3.1).

Tests

Appearance of solution. Suspend 1.0 g in 5 ml of *water* and dilute to 20 ml with *0.1 M sodium hydroxide*; the solution is clear (2.4.1), and not more intensely coloured than reference solution BYS6 (2.4.1).

Completeness of solution. The contents dissolve in the quantity of the solvent recommended on the label and give a clear solution.

pH (2.4.24). 10.0 to 12.0, determined in a 5.0 per cent w/v solution in the stated solvent.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 45 volumes of *chloroform*, 45 volumes of *2-propanol* and 10 volumes of *strong ammonia solution*.

Test solution. Dissolve 0.4 g of the substance under examination in 10 ml of *methanol*.

Reference solution (a). A 0.04 per cent w/v solution of the substance under examination in *methanol*.

Reference solution (b). A 0.02 per cent w/v solution of *benzophenone* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate at 80° for 5 minutes and examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and any spot corresponding to benzophenone is not more intense than the spot in the chromatogram obtained with reference solution (b).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Water (2.3.43). Not more than 3.0 per cent, determined on 1.0 g.

Assay. Weigh accurately about 0.18 g of the mixed contents of 10 containers, suspend in 2 ml of *water*, add 8 ml of *0.05 M sulphuric acid* and heat gently for 1 minute. Add 30 ml of *methanol*, cool. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). After the first inflection, stop the addition of *sodium hydroxide*, add 5 ml of *silver nitrate solution* in *pyridine*, mix and continue the titration until a second inflection is reached. Record the volume of *0.1 M sodium hydroxide* added between the two inflections.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.02743 g of $C_{15}H_{11}N_2NaO_2$.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Labelling. The label states (1) the quantity of Phenytoin Sodium contained in it; (2) the directions for preparing the Injection.

Phenytoin Capsules

Phenytoin Sodium Capsules; Diphenylhydantoin Sodium Capsules

Phenytoin Capsules contain not less than 92.7 per cent and not more than 107.5 per cent of the stated amount of phenytoin sodium, $C_{15}H_{11}N_2NaO_2$.

Usual strength. 10 mg.

Identification

A. Centrifuge the precipitated mixture obtained in test B, dissolve the residue in *methanol*, evaporate and dry at 105° for 30 minutes. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenytoin sodium RS* or with the reference spectrum of phenytoin sodium.

B. Shake a quantity of the content of capsules containing about 0.5 g of Phenytoin Sodium with 10 ml of *water* and filter. The filtrate yields a white precipitate on the addition of *2 M hydrochloric acid*.

C. To 0.1 g of the residue obtained in test A, add 0.5 ml of *1 M sodium hydroxide*, 10 ml of a 10 per cent w/v solution of *pyridine* and 1 ml of *copper sulphate-pyridine reagent* and allow to stand for 10 minutes. A blue precipitate is produced.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 10 volumes of *13.5 M ammonia*, 45 volumes of *chloroform* and 45 volumes of *propan-2-ol*.

Test solution. Shake a quantity of the content of capsules containing about 0.2 g of Phenytoin Sodium with 5 ml of *methanol*, warm on a water-bath with shaking and filter.

Reference solution (a). Dilute 1 ml of the test solution to 200 ml with *methanol*.

Reference solution (b). A 0.02 per cent w/v solution of *benzophenone* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry at 80° for 5 minutes and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution corresponding to benzophenone is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent) and any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Shake a quantity of the mixed contents of 20 capsules containing about 0.25 g of Phenytoin Sodium with 50 ml of *0.01 M sodium hydroxide*. Centrifuge, acidify 25 ml of the clear liquid with 10 ml of *0.1 M hydrochloric acid* and extract with successive quantities of 50, 40 and 25 ml of *ether*. Wash the combined extracts with 10 ml of *water*, evaporate to dryness and dry the residue at 105°. Dissolve in 50 ml of *anhydrous pyridine*. Titrate with *0.1 M tetrabutylammonium hydroxide* using 0.3 per cent w/v solution of *thymol blue* in *anhydrous pyridine* as indicator.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.02743 g of $C_{15}H_{11}N_2NaO_2$.

Phenytoin Tablets

Phenytoin Sodium Tablets; Diphenylhydantoin Sodium Tablets

Phenytoin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of phenytoin sodium, $C_{15}H_{11}N_2NaO_2$. The tablets are coated.

Usual strengths. 50 mg; 100 mg.

Identification

A. Shake a quantity of the powdered tablets containing 0.1 g of Phenytoin Sodium with 20 ml of *water*, filter, acidify with *dilute hydrochloric acid* and extract with 10 ml of *chloroform*. Wash the chloroform extract with *water*, dry with *anhydrous sodium sulphate* and evaporate to dryness and dry the residue at 105°. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *phenytoin sodium sodium RS* treated in the same manner or with the reference spectrum of phenytoin sodium.

B. Triturate a quantity of the powdered tablets containing 0.5 g of Phenytoin Sodium with 10 ml of *water* and filter. Acidify with *dilute hydrochloric acid*; a white precipitate is produced.

C. The powdered tablets, when moistened with *hydrochloric acid* and introduced on a platinum wire into a flame, impart a yellow colour to the flame.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 75 volumes of *hexane* and 30 volumes of *dioxan.*

Test solution. Shake a quantity of the powdered tablets containing 0.1 g of Phenytoin Sodium with 5 ml of *methanol,* warm on a water-bath with shaking and filter.

Reference solution. A 0.01 per cent w/v solution of *benzophenone* in *methanol.*

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in air and examine in ultraviolet light at 254 nm. In the chromatogram obtained with the test solution any spot corresponding to benzophenone is not more intense than the spot in the chromatogram obtained with the reference solution.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 0.25 g of Phenytoin Sodium, shake with 40 ml of *0.01 M sodium hydroxide* for 5 minutes and add sufficient *0.01 M sodium hydroxide* to produce 50.0 ml. Centrifuge, acidify 25.0 ml of the clear liquid with 10 ml of *0.1 M hydrochloric acid* and extract successively with 50, 40, 25 and 25 ml of *ether.* Wash the combined extracts with 10 ml of *water,* evaporate to dryness and dry the residue at 105°. Dissolve in 50 ml of *anhydrous pyridine* and titrate with *0.1 M tetrabutylammonium hydroxide,* using 0.3 per cent w/v solution of *thymol blue* in *pyridine* as indicator and taking care to prevent absorption of carbon dioxide from the atmosphere. Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.02743 g of $C_{15}H_{11}N_2NaO_2$.

Storage. Store protected from moisture.

Phenytoin Oral Suspension

Diphenylhydantoin Oral Suspension

Phenytoin Oral Suspension is a mixture of consisting of Phenytoin with buffering agents and other excipients. It contains a suitable flavouring agent. It is filled in a sealed container.

The suspension is constituted by dispersing the contents of the sealed container in the specific volume of Water just before use.

Phenytoin Oral Suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of phenytoin, $C_{15}H_{12}N_2O_2$.

When stored at the temperature and for the period stated on the label during which the constituted suspension may be expected to be satisfactory for use, it contains not less than 80.0 per cent of the stated amount of phenytoin, $C_{15}H_{12}N_2O_2$.

Usual strength. 25 mg per ml.

Storage. Store protected from moisture at a temperature not exceeding 30°.

The constituted suspension complies with the tests stated under Oral Liquids and with the following tests.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtain with *phenytoin RS* or with the reference spectrum of phenytoin.

Tests

pH (2.4.24). 4.5 to 5.5 determined on 1.0 g.

Benzil and benzophenone. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 30 volumes of *1, 4-dioxan* and 75 volumes of *hexane.*

Test solution. Disperse a quantity of suspension containing about 30 mg of Phenytoin in 5 ml of *water* add 2 ml of *2 M hydrochloric acid,* mix well and extract with five 20 ml quantities of *ether.* Combine the ether extracts, wash with three 10 ml quantities of *water,* evaporate to dryness and dissolve the residue in 1.5 ml of a mixture of 1 volume of *glacial acetic acid* and 9 volumes of *acetone.*

Reference solution (a). A 0.004 per cent w/v solution of *benzophenone* in *ethanol (95 per cent).*

Reference solution (b). A 0.004 per cent w/v solution of *benzil* in *ethanol (95 per cent).*

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in air and examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtain with reference solution (a) (0.2 per cent) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent).

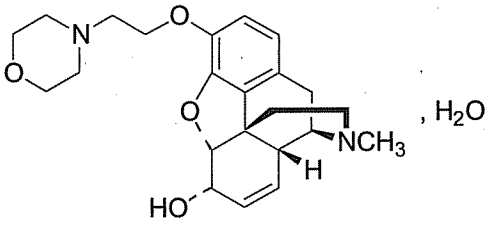
Assay. Disperse a quantity of the suspension containing about 0.2 g of Phenytoin, add 10 ml of *2 M hydrochloric acid* and 15 ml of *water,* extract with three 50 ml quantities of a mixture of 3 volumes of *chloroform* and 1 volume of *propan-2-ol* and evaporate the combined extract to dryness. Dry the residue at 105° for 1 hour, cool and dissolve in a mixture of 3 ml of *1 M sodium hydroxide* and 50 ml of *water* with the aid of gentle

heat. Cool and pass a current of *carbon dioxide* through the solution until precipitation of phenytoin is complete, filter and wash the residue with two 10 ml quantities of *water* and dry at 105° for 2 hours.

Determine the weight per ml (2.4.29) of the oral suspension.

Calculate the content of $C_{15}H_{12}N_2O_2$, weight in volume.

Pholcodine



$C_{23}H_{30}N_2O_4,H_2O$ Mol. Wt. 416.5

Pholcodine is 7,8-didehydro-4,5α-epoxy-17-methyl-3-[2-(morpholin-4-yl)ethoxy]morphinan-6α-ol monohydrate.

Pholcodine contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{23}H_{30}N_2O_4$, calculated on the dried basis.

Category. Cough suppressant.

Dose. Upto 40 mg daily, in divided doses.

Description. A white or almost white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pholcodine RS* or with the reference spectrum of pholcodine.

B. To 10 ml of a 0.1 per cent w/v solution add 75 ml of *water* and 10 ml of *1 M sodium hydroxide* and dilute to 100 ml with *water*. When examined in the range 230 nm and 360 nm (2.4.7), the resulting solution shows an absorption maximum at about 284 nm; absorbance at about 284 nm, 0.36 to 0.39.

C. Dissolve 50 mg in 1 ml of *sulphuric acid* and add 0.05 ml of a 10 per cent w/v solution of *ammonium molybdate*; a pale blue colour is produced. Warm gently; the colour changes to deep blue. Add 0.05 ml of *2 M nitric acid*; the colour changes to brownish red.

Tests

Specific optical rotation (2.4.22). –94.0° to –98.0°, determined at 20° in a 2.0 per cent w/v solution in *ethanol (95 per cent)*.

Morphine. Dissolve 0.1 g in sufficient of *0.1 M hydrochloric acid* to produce 5 ml, add 2 ml of a 1 per cent w/v solution of *sodium nitrite*, allow to stand for 15 minutes and add 3 ml of *6 M ammonia*. The solution is not more intensely coloured than reference solution BS4 (2.4.1).

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 70 volumes of *ethanol (95 per cent)*, 70 volumes of *toluene*, 65 volumes of *acetone* and 5 volumes of *strong ammonia solution*.

Test solution. Dissolve 0.25 g of the substance under examination in 10 ml of *chloroform*.

Reference solution (a). A 0.025 per cent w/v solution of the substance under examination in *chloroform*.

Reference solution (b). A 0.0125 per cent w/v solution of the substance under examination in *chloroform*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air, spray with *dilute potassium iodobismuthate solution*. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot of higher Rf value than the principal spot is more intense than the spot in the chromatogram obtained with reference solution (b).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). 3.9 to 4.5 per cent, determined on 0.5 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.18 g, dissolve in 50 ml of *anhydrous glacial acetic acid*, warming gently. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically at the second inflection (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01993 g of $C_{23}H_{30}N_2O_4$.

Storage. Store protected from moisture.

Pholcodine Linctus

Pholcodine Linctus is a solution containing 0.1 per cent w/v solution of Pholcodine and 1 per cent w/v solution of Citric Acid Monohydrate in a suitable flavoured vehicle.

Pholcodine Linctus contains not less than 0.090 per cent and not more than 0.110 per cent w/v of pholcodine, $C_{23}H_{30}N_2O_4,H_2O$.

Category. Opioid cough suppressant.

Identification

To 20 ml add 20 ml of *water*, make alkaline to *litmus paper* with *5 M ammonia*, extract with two quantities, each of 20 ml, of *chloroform*, washing each extract with 5 ml of *water*, dry the combined extracts with *anhydrous sodium sulphate*, filter and evaporate to dryness. If necessary, add 0.1 ml of ether and scratch the sides of the vessel with a glass rod to induce crystallisation. The crystals, dried at a pressure not exceeding 2 kPa, comply with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pholcodine RS* or with the reference spectrum of pholcodine.

B. When examined in the range 230 nm and 360 nm (2.4.7), a 0.01 per cent w/v solution in *0.01 M sodium hydroxide* shows an absorption maximum only at about 284 nm.

C. To a portion of the crystals add 0.05 ml of *nitric acid* and mix; a yellow colour is produced.

D. Dissolve the remainder of the crystals in 1 ml of *sulphuric acid* and add 0.05 ml of *ammonium molybdate-sulphuric acid solution*; a pale blue colour is produced. Warm gently; the colour changes to deep blue. Add 0.05 ml of *2 M nitric acid*; the colour changes to brownish red.

Tests

Other tests. Complies with the tests stated under Oral Liquids.

Assay. Weigh accurately about 50 g and add sufficient *5 M ammonia* to make the solution alkaline to *litmus paper*, extract with four quantities, each of 25 ml, of *chloroform*, washing each extract with the same 5 ml of *water*. Combine the extracts and evaporate until the volume is reduced to 15 ml. Titrate with *0.02 M perchloric acid,* using *quinaldine red solution* as indicator. Carry out a blank titration.

1 ml of *0.02 M perchloric acid* is equivalent to 0.004165 g of $C_{23}H_{30}N_2O_4,H_2O$.

Determine the weight per ml of the linctus (2.4.29), and calculate the content of $C_{23}H_{30}N_2O_4,H_2O$, weight in volume.

Storage. Store protected from light.

Labelling. The label states the strength in terms of the equivalent amount of pholcodine.

Phosphoric Acid

Orthophosphoric Acid; Concentrated Phosphoric Acid

H_3PO_4 Mol. Wt. 98.0

Phosphoric acid contains not less than 84.0 per cent w/w and not more than 90.0 per cent w/w of H_3PO_4.

Category. Pharmaceutical aid (acidifying agent).

Description. A clear, colourless, syrupy liquid; corrosive. When kept at a low temperature it may solidify, producing a mass of colourless crystals which do not melt until the temperature reaches 28°.

Identification

A. Dilute with *water*; the solution is strongly acidic.

B. Dilute 10.0 g to 150 ml with *water* (solution A). Neutralise with *2 M sodium hydroxide*; the resulting solution gives the reactions of phosphates (2.3.1).

Tests

Appearance of solution. Solution A is clear (2.4.1), and colourless (2.4.1).

Arsenic (2.3.10). Dissolve 5.0 g in 50 ml of *water* and add 10 ml of *stannated hydrochloric acid*; the resulting solution complies with the limit test for arsenic (2 ppm).

Heavy metals (2.3.13). Dilute 1.2 ml with 10 ml of *water*, neutralise with *dilute ammonia solution*, add sufficient *dilute acetic acid* to render the solution acidic and then dilute to 25 ml with *water*. The resulting solution complies with the limit test for heavy metals, Method A (10 ppm).

Iron (2.3.14). 10 ml of solution A complies with the limit test for iron (60 ppm).

Chlorides (2.3.12). 3 ml of solution A complies with the limit test for chlorides (50 ppm).

Sulphates (2.3.17). 20 ml of solution A complies with the limit test for sulphates (100 ppm).

Alkali phosphates. To 1.7 g in a graduated cylinder add 6 ml of *ether* and 2 ml of *ethanol (95 per cent)*; no turbidity is produced.

Aluminium and calcium. To 1.7 g add 10 ml of *water* and 8 ml of *dilute ammonia solution*; the solution remains clear.

Hypophosphorus acid and phosphorous acid. To 5 ml of solution A add 2 ml of a 1.7 per cent w/v solution of *silver nitrate* and heat on a water-bath for 5 minutes; the appearance of the solution does not change.

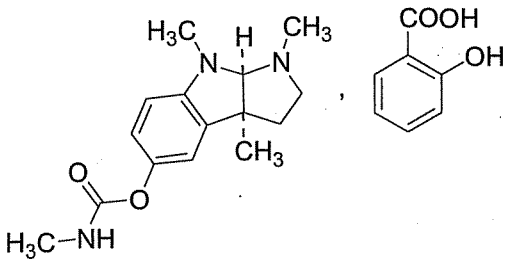
Assay. Weigh accurately about 1.0 g, add a solution of 10 g of *sodium chloride* in 30 ml of *water* and titrate with *1 M sodium hydroxide* using *dilute phenolphthalein solution* as indicator.

1 ml of *1 M sodium hydroxide* is equivalent to 0.04900 g of H_3PO_4.

Storage. Store protected from moisture, in glass containers.

Physostigmine Salicylate

Eserine Salicylate



$C_{15}H_{21}N_3O_2,C_7H_6O_3$ Mol. Wt. 413.5

Physostigmine Salicylate is (3*aS*,8*aR*)-1,2,3,3a,8,8a-hexahydro-1,3a,8-trimethylpyrrolo[2,3-*b*]indol-5-yl methylcarbamate salicylate.

Physostigmine Salicylate contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{15}H_{21}N_3O_2$, $C_7H_6O_3$, calculated on the dried basis.

Category. Anticholinesterase.

Dose. By subcutaneous or intramuscular injection, 600 µg to 1.2 mg.

Description. A colourless or faintly yellow crystals, turning red gradually under the action of air and light and rapidly in presence of moisture; odourless.

Identification

Test A may be omitted if tests B, C and D are carried out. Test C may be omitted if tests A, B and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *physostigmine salicylate RS.*

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

C. To a 1 per cent w/v solution add *1 M sodium hydroxide*; a white precipitate which turns pink is produced. The precipitate dissolves in an excess of the reagent, producing a red solution.

D. A 0.9 per cent w/v solution in *carbon dioxide-free water* gives reaction A of salicylates (2.3.1).

Tests

Appearance of solution. Dissolve 0.9 g without heating in 95 ml of *carbon dioxide-free water* prepared from *distilled water*, and dilute to 100 ml with the same solvent (solution A). The solution, examined immediately after preparation, is clear (2.4.1), and colourless (2.4.1).

pH (2.4.24). 5.1 to 5.9, determined in solution A immediately after preparation.

Specific optical rotation (2.4.22). –90.0° to –94.0°, determined in solution A immediately after preparation.

Eseridine. To 5 ml of solution A, examined immediately after preparation, add a few crystals of *potassium iodate* and a drop of *2 M hydrochloric acid* and 2 ml of *chloroform* and shake; the chloroform layer does not turn violet within 1 minute.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G.*

Mobile phase. A mixture of 100 volumes of *cyclohexane*, 23 volumes of *2-propanol* and 2 volumes of *strong ammonia solution.*

Test solution (a). Dissolve 0.2 g of the substance under examination in 10 ml of *ethanol (95 per cent).*

Test solution (b). Dissolve 0.1 g of the substance under examination in 100 ml of *ethanol (95 per cent).*

Reference solution (a). A 0.1 per cent w/v solution of *physostigmine salicylate RS* in *ethanol (95 per cent).*

Reference solution (b). A 0.01 per cent w/v solution of *physostigmine salicylate RS* in *ethanol (95 per cent).*

Apply to the plate 20 µl of each solution. After development, dry the plate in cold air, carry out a second chromatographic development in same direction, dry the plate in air and spray with freshly prepared *acetic potassium iodobismuthate solution* and then with *hydrogen peroxide solution (10 vol).* Examine the plate within 2 minutes. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b).

Sulphates (2.3.17). 15 ml of solution A complies with the limit test for sulphates (0.1 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent, determined on the residue obtained in the test for Loss on drying.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.35 g, dissolve in 50 ml of a mixture of equal volumes of *chloroform* and *anhydrous glacial acetic acid.* Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04135 g of $C_{15}H_{21}N_3O_2,C_7H_6O_3$.

Storage. Store protected from light and moisture.

Physostigmine Injection

Physostigmine Salicylate Injection; Eserine Salicylate Injection

Physostigmine Injection is a sterile solution of Physostigmine Salicylate in Water for Injections.

Physostigmine Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of physostigmine salicylate, $C_{15}H_{21}N_3O_2, C_7H_6O_3$.

Usual strength. 600 µg per ml.

Identification

A. Warm a volume containing 3 mg of Physostigmine Salicylate with 0.3 ml of *5 M ammonia*; a yellowish red solution is produced which on evaporation gives a bluish residue.

B. The residue obtained in test A dissolves in *ethanol (95 per cent)* producing a blue solution which, on the addition of *6 M acetic acid*, appears blue by transmitted light and exhibits a red fluorescence which intensifies on dilution with *water*.

C. The residue obtained in test A dissolves in *sulphuric acid* producing a green solution which, on the gradual addition of *ethanol (95 per cent)*, changes to red but reverts to green when the ethanol is evaporated.

Tests

pH (2.4.24). 4.0 to 6.0.

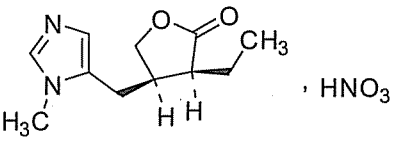
Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. Transfer an accurately measured volume containing 30 mg of Physostigmine Salicylate to a separator, add about 0.25 g of *sodium bicarbonate* and extract with six quantities, each of 15 ml, of *chloroform*. Filter the combined chloroform extracts through about 10 g of *anhydrous sodium sulphate*. Add 25 ml of *anhydrous glacial acetic acid* to the filtrate. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.01 M perchloric acid* is equivalent to 0.004135 g of $C_{15}H_{21}N_3O_2, C_7H_6O_3$.

Storage. Store protected from light, in single dose containers. The injection should not be used if it is more than slightly discoloured.

Pilocarpine Nitrate



$C_{11}H_{16}N_2O_2, HNO_3$ Mol. Wt. 271.3

Pilocarpine Nitrate is (3*S*,4*R*)-3-ethyl-4-[(1-methyl-1*H*-imidazol-5-yl)methyl]dihydrofuran-2(3*H*)-one nitrate.

Pilocarpine Nitrate contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{11}H_{16}N_2O_2, HNO_3$, calculated on the dried basis.

Category. Cholinergic (ophthalmic) in glaucoma.

Description. Colourless crystals or a white, crystalline powder; odourless; sensitive to light.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pilocarpine nitrate RS*.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

C. Dissolve about 10 mg in 2 ml of *water*, add 2 drops of a 5 per cent w/v solution of *potassium dichromate*, 1 ml of *hydrogen peroxide solution (10 vol)* and 2 ml of *chloroform* and shake; the chloroform layer turns violet.

D. Gives reaction A of nitrates (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and not more intensely coloured than reference solution YS6 (2.4.1).

pH (2.4.24). 3.5 to 4.5, determined in a 5.0 per cent w/v solution prepared immediately before use in *carbon dioxide-free water*.

Specific optical rotation (2.4.22). +79.5° to +83.0°, determined in a 5.0 per cent w/v solution in *carbon dioxide-free water*, prepared immediately before use.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 85 volumes of *chloroform*, 14 volumes of *methanol* and 1 volume of *strong ammonia solution*.

Test solution (a). Dissolve 0.3 g of the substance under examination in 10 ml of *water*.

Test solution (b). Dissolve 0.1 g of the substance under examination in 100 ml of *water*.

Reference solution (a). A 0.1 per cent w/v solution of *pilocarpine nitrate RS* in *water*.

Reference solution (b). A 0.03 per cent w/v solution of *pilocarpine nitrate RS* in *water*.

Apply to the plate 10 µl of each solution. After development, dry the plate at 105° for 10 minutes, cool and spray with *potassium iodobismuthate solution*. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b).

Other alkaloids. To a 1 per cent w/v solution add *dilute ammonia solution*; no turbidity is produced. To a 1 per cent w/v solution add a few drops of *potassium dichromate solution*; no turbidity is produced.

Chlorides (2.3.12). 25 ml of a 10.0 per cent w/v solution complies with the limit test for chlorides (100 ppm).

Iron (2.3.14). 20 ml of a 10.0 per cent w/v solution complies with the limit test for iron (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent, determined on 0.5 g.

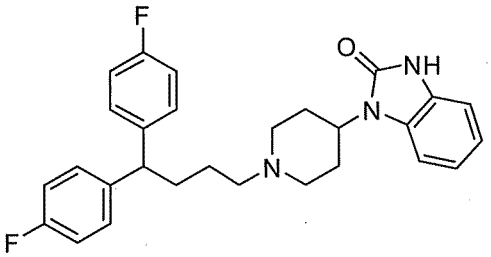
Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.25 g, dissolve in 30 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02713 g of $C_{11}H_{16}N_2O_2, HNO_3$.

Storage. Store protected from light and moisture.

Pimozide



$C_{28}H_{29}F_2N_3O$ Mol.Wt. 461.6

Pimozide is 1-[1-[4,4-bis(4-fluorophenyl)butyl]piperidin-4-yl]-1,3-dihydro-2*H*-benzimidazol-2-one.

Pimozide contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{28}H_{29}F_2N_3O$, calculated on the dried basis.

Category. Antipsychotic.

Description. A white to almost white powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pimozide RS* or with the reference spectrum of pimozide.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 10 volumes of *acetone* and 90 volumes of *methanol*.

Test solution. Dissolve 30 mg of the substance under examination in 10 ml of the mobile phase.

Reference solution (a). A 0.3 per cent w/v solution of *pimozide RS* in the mobile phase.

Reference solution (b). A solution containing 0.3 per cent w/v each of *pimozide RS* and *benperidol RS* in the mobile phase.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in a current of warm air for 15 minutes and expose it to iodine vapour until the spots appear. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

C. Mix about 5 mg of the substance under examination with 45 mg of *heavy magnesium oxide* and ignite in a crucible until an almost white residue is obtained. Allow to cool, add 1 ml of *water*, 0.05 ml of *phenolphthalein solution* and about 1 ml of *dilute hydrochloric acid* to render the solution colourless. Filter. To a freshly prepared mixture of 0.1 ml of *alizarin S solution* and 0.1 ml of *zirconyl nitrate solution*, add 1.0 ml of the filtrate. Mix allow to stand for 5 minutes and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow and the blank is red.

D. Melting point (2.4.21). 216° to 220°.

Tests

Appearance of solution. A 1.0 per cent w/v solution in *methanol* is clear (2.4.1) and not more intensely coloured than reference solution YS7 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 100 mg of the substance under examination in 10 ml of *methanol.*

Reference solution (a). Dissolve 5 mg of *pimozide RS* and 2 mg of *mebendazole RS* in 100 ml of *methanol.*

Reference solution (b). Dilute 5.0 ml of the test solution to 100 ml with *methanol.* Dilute 1.0 ml of this solution to 10 ml with *methanol.*

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (3 µm),
- mobile phase: A. a solution containing 0.25 per cent w/v of *ammonium acetate* and 0.85 per cent w/v of *tetrabutylammonium hydrogen sulphate*,
  B. *acetonitrile,*
- flow rate. 2ml per minute,
- a linear gradient programme using the conditions given below,
- spectrophotometer set at 280 nm,
- injection volume. 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0 – 10	80 → 70	20 → 30
10 – 15	70	30
15 – 20	80	20

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to mebendazole and pimozide is not less than 5.0.

Inject the test solution and reference solution (b). In the chromatogram obtained with the test solution, the area of any peak due to (1-(piperidin-4-yl)-1,3-dihydro-2H-benzimidazol-2-one) (pimozide impurity A), (1-[1-[(4RS)-4-(4-fluorophenyl)-4-phenylbutyl]piperidin-4-yl]-1,3-dihydro-2H-benzimidazol-2-one) (pimozide impurity B), (1-[1-[(4RS)-4-(2-fluorophenyl)-4-(4-fluorophenyl)butyl]piperidin-4-yl]-1,3-dihydro-2H-benzimidazol-2-one) (pimozide impurity C), (1-[1-[4,4-bis(4-fluorophenyl)butyl]-1,2,3,6-tetrahydropyridin-4-yl]-1,3-dihydro-2H-benzimidazol-2-one) (pimozide impurity D), (1-[1-[4,4-bis(4-fluorophenyl)butyl]piperidin-4-yl 1-oxide]-1,3-dihydro-2H-benzimidazol-2-one) (pimozide impurity E), is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). The sum of the areas of all the secondary peaks is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.75 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.3 g in 50 ml of a mixture of 1 volume of *anhydrous glacial acetic acid* and 7 volumes of *methyl ethyl ketone* and titrate with *0.1 M perchloric acid,* using 0.2 ml of *naphtholbenzein solution* as indicator. Carry out a blank titration.

1 ml *0.1 M perchloric acid* is equivalent to 0.04616 g of $C_{28}H_{29}F_2N_3O$.

Storage. Store protected from light.

Pimozide Tablets

Pimozide Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of pimozide, $C_{28}H_{29}F_2N_3O$.

Usual strengths. 1 mg; 2 mg; 4 mg.

Identification

A. Shake a quantity of the powdered tablets containing about 20 mg of Pimozide with 20 ml of *dichloromethane* for 5 minutes, filter and evaporate the filtrate to dryness under reduced pressure. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pimozide RS* or with the reference spectrum of pimozide.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1,
Medium. 900 ml of *0.01 M hydrochloric acid,*
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Dilute the filtrate, if necessary with the dissolution medium.

Reference solution. A 0.0002 per cent w/v solution of *pimozide RS* in dissolution medium.

Use chromatographic system as described under Related substances.

Calculate the content of pimozide, $C_{28}H_{29}F_2N_3O$.

D. Not less than 70 per cent of the stated amount of $C_{28}H_{29}F_2N_3O$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of powdered tablets containing about 40 mg of Pimozide with 20 ml of *methanol* for 30 minutes, mix with the aid of ultrasound for 10 minutes, centrifuge and filter the supernatant liquid.

Reference solution (a). Dilute 1 ml of the test solution to 200 ml with *methanol.*

Reference solution (b). A solution containing 0.005 per cent w/v of *pimozide RS* and 0.002 per cent w/v of *mebendazole RS* in *methanol.*

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm packed with endcapped octadecylsilane bonded to porous silica (3 µm) (Such as Hypersil ODS),
- mobile phase: A. a solution containing 0.25 per cent w/v of *ammonium acetate* and 0.85 per cent w/v of *tetrabutylammonium hydrogen sulphate,*
  B. *acetonitrile,*
- a linear gradient programme using the conditions given below,
- flow rate. 2 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume. 10 µl.

Time (min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	80	20
10	70	30
15	70	30
16	80	20
30	80	20

Inject reference solution (b). The test is not valid unless the resolution between the peaks obtained with mebendazole and pimozide is not less than 5.0.

Inject the test solution and reference solution (a). In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of the areas of all secondary peaks is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.75 per cent).

Uniformity of content *(For tablets containing 10 mg or less).* Comply with the test stated under Tablets.

Test solution. Shake one tablet with 7 ml of *methanol* for 30 minutes, dilute with *methanol* to produce a solution containing 0.01 per cent w/v of Pimozide, mix with the aid of ultrasound for 10 minutes, centrifuge and filter the supernatant liquid.

Reference solution (a). A 0.01 per cent w/v solution of *pimozide RS* in *methanol.*

Reference solution (b). A solution containing 0.005 per cent w/v of *pimozide RS* and 0.002 per cent w/v of *mebendazole RS* in *methanol.*

Use chromatographic system as described under Related substances.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to pimozide and mebendazole is not less than 5.0.

Inject the test solution and reference solution (a).

Calculate the content of $C_{28}H_{29}F_2N_3O$ in each tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of powdered tablets containing about 20 mg of Pimozide with 35 ml of *methanol* for 30 minutes, dilute to 50 ml with *methanol,* mix with the aid of ultrasound for 10 minutes, centrifuge and filter the supernatant liquid.

Reference solution (a). A 0.04 per cent w/v solution of *pimozide RS* in *methanol.*

Reference solution (b). A solution containing 0.004 per cent w/v of *pimozide RS* and 0.002 per cent w/v of *mebendazole RS* in *methanol.*

Use chromatographic system as described under Related substances.

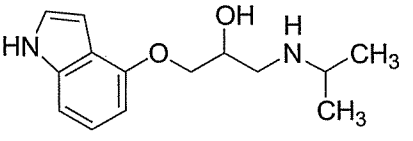
Inject reference solution (b). The test is not valid unless the resolution between the peaks due to pimozide and mebendazole is not less than 5.0.

Inject the test solution and reference solution (a).

Calculate the content of $C_{28}H_{29}F_2N_3O$ in the tablets.

Storage. Store protected from light.

Pindolol



$C_{14}H_{20}N_2O_2$ Mol. wt. 248.3

Pindolol is (*RS*)-1-indol-4-yloxy-3-isopropylaminopropan-2-ol.

Pindolol contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{14}H_{20}N_2O_2$, calculated on the dried basis.

Category. Beta-adrenoceptor antagonist.

Dose. 10 to 30 mg daily.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Test B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pindolol RS.*

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.002 per cent w/v solution in a 0.085 per cent v/v solution of *hydrochloric acid* in *methanol* shows absorption maxima at about 264 nm and at about 287 nm, and a shoulder at about 275 nm, absorbances at about 264 nm, 0.66 to 0.70 and at about 287 nm, 0.34 to 0.38.

C. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *dilute acetic acid* is clear (2.4.1) and not more intensely coloured than reference solution BYS4 (2.4.1).

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

NOTE— Prepare the solutions immediately before use and protected from light.

Solvent mixture. 99 volumes of *methanol* and 1 volume of *anhydrous glacial acetic acid.*

Mobile phase. A freshly prepared mixture of 50 volumes of *ethyl acetate,* 50 volumes of *methanol* and 4 volumes of *strong ammonia solution.*

Test solution (a). Dissolve 0.2 g of the substance under examination in 10 ml of the solvent mixture.

Test solution (b). Dissolve 0.2 g of the substance under examination in 100 ml of the solvent mixture.

Reference solution (a). A 0.2 per cent w/v solution of *pindolol RS* in the solvent mixture.

Reference solution (b). A 0.006 per cent w/v solution of *pindolol RS* in the solvent mixture.

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate immediately in a current of cold air and examine in ultraviolet at 254 nm without delay. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.3 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method C (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.2 g, dissolve in 80 ml of *methanol.* Titrate with *0.1 M hydrochloric acid,* determining the end-point potentiometrically (2.4.25).

1 ml of *0.1 M hydrochloric acid* is equivalent to 0.02483 g of $C_{14}H_{20}N_2O_2$.

Storage. Store protected from light and moisture.

Pindolol Tablets

Pindolol Tablets contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of pindolol, $C_{14}H_{20}N_2O_2$.

Usual strengths. 5 mg; 15 mg.

Identification

A. Shake a quantity of the powdered tablets containing 50 mg of Pindolol with 80 ml of *ether* for 30 minutes, filter and dry the extract with *anhydrous sodium sulphate.* Filter the extract, remove the *ether* using a rotary evaporator and dry the residue over *phosphorus pentoxide* at 110° at a pressure not exceeding 2 kPa for 1 hour. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pindolol RS.*

B. When examined in the range 230 nm to 360 nm (2.4.7), the final solution obtained in the Assay shows absorption maxima at about 264 nm and 287 nm.

C. Shake a quantity of the powdered tablets containing 20 mg of Pindolol with 5 ml of a mixture of 99 volumes of *methanol* and 1 volume of *glacial acetic acid* for 45 minutes. Centrifuge and dilute 1 ml of the supernatant liquid to 50 ml with the *acetic acid-methanol* mixture. To 2 ml of this solution add 1 ml of *dimethylaminobenzaldehyde solution*; a violet-blue colour is produced.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

NOTE— Prepare the solutions immediately before use and protected from light.

Solvent mixture. 99 volumes of *methanol* and 1 volume of *anhydrous glacial acetic acid.*

Mobile phase. A freshly prepared mixture of 50 volumes of *ethyl acetate*, 50 volumes of *methanol* and 4 volumes of *strong ammonia solution.*

Test solution. Shake a quantity of the powdered tablets containing 20 mg of Pindolol with 5 ml of the solvent mixture for 15 minutes, centrifuge and apply the supernatant liquid to the plate as the last solution.

Reference solution (a). Dilute 1 ml of the test solution to 10 ml with the solvent mixture and further dilute 7 ml of the solution to 100 ml with the solvent mixture.

Reference solution (b). Dilute 1 ml of the test solution to 10 ml with the solvent mixture and further dilute 3 ml of this solution to 100 ml with the solvent mixture.

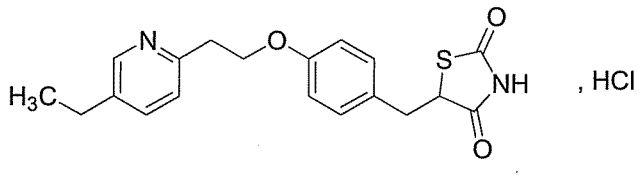
Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 10 cm. Dry the plate in air, spray immediately with *dimethylaminobenzaldehyde solution* and warm at 50° for 20 minutes. Any spot with R_f value of about 0.1 in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.7 per cent). Any other secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.3 per cent). Ignore any spot remaining on the line of application.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powdered tablets containing about 90 mg of Pindolol and shake with 100.0 ml of *methanol* for 45 minutes. Centrifuge and dilute 15.0 ml of the supernatant liquid to 100.0 ml with *methanol* and measure the absorbance of the resulting solution at the maximum at about 264 nm (2.4.7). Calculate the content of $C_{14}H_{20}N_2O_2$ taking 338 as the specific absorbance at 264 nm.

Storage. Store protected from light.

Pioglitazone Hydrochloride



$C_{19}H_{20}N_2O_3S,HCl$ Mol.Wt. 392.9

Pioglitazone Hydrochloride is (*RS*)-5-{4-[2-(5-ethyl-2-pyridinyl)ethoxy]benzyl}thiazolidine-2,4-dione hydrochloride.

Pioglitazone Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{19}H_{20}N_2O_3S,HCl$, calculated on the dried basis.

Category. Antidiabetic.

Description. A white or almost white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pioglitazone hydrochloride RS* or with the reference spectrum of pioglitazone hydrochloride.

B. Gives reaction A of chlorides (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *methanol* is clear (2.4.1) and not more intensely coloured than reference solution BYS7 (2.4.1).

Related Substances. Determine by liquid chromatography (2.4.14)

Test solution. Dissolve 30 mg of the substance under examination in 100.0 ml of *methanol.*

Reference solution (a). A 0.03 per cent w/v solution of *pioglitazone hydrochloride RS* in *methanol.*

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with *methanol.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature. 25°,
- mobile phase: a mixture of 50 volumes of *0.01 M potassium dihydrogen phosphate* and 50 volumes of *acetonitrile*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume. 20 µl.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2500 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the blank, the test solution and reference solution (b). In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than the area of the peak in the chromatogram obtained with reference solution (b) (1.0 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by dying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14) as described under the test for Related substances.

Inject the test solution and reference solution (a).

Calculate the content of $C_{19}H_{20}N_2O_3S$,HCl.

Pioglitazone Tablets

Pioglitazone Hydrochloride Tablets

Pioglitazone Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of pioglitazone, $C_{19}H_{20}N_2O_3S$.

Usual strengths. 15 mg; 30 mg; 45 mg.

Identification

A. Shake a quantity of the powdered tablets containing 0.1 g of pioglitazone with 40 ml of *methanol,* filter and evaporate the filtrate to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pioglitazone hydrochloride RS* or with the reference spectrum of pioglitazone hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the medium if necessary, at the maximum at about 270 nm (2.4.7). Calculate the content of $C_{19}H_{20}N_2O_3S$ in the medium from the absorbance obtained from a solution of known concentration *of pioglitazone hydrochloride RS* in the same medium.

D. Not less than 70 per cent of the stated amount of $C_{19}H_{20}N_2O_3S$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution: Weigh and powder 20 tablets. Transfer a quantity of the powder equivalent to 30 mg of pioglitazone and add about 150 ml of *methanol.* Mix with the aid of ultrasound at a temperature not exceeding 30° for 15 minutes and shake for 20 minutes. Dilute to 250 ml with *methanol* and mix. Filter through a membrane filter and discard the first 5 ml. Use the filtrate as the test solution.

Reference solution. A solution of *pioglitazone hydrochloride RS* in *methanol* containing 0.00012 per cent w/v of pioglitazone.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of *0.01 M potassium dihydrogen phosphate* and 50 volumes of *acetonitrile,*
- flow rate. 1 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume. 20 µl.

Inject the test solution and the reference solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than twice the area of the peak in the chromatogram obtained with the reference solution (2.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of 35 volumes of *water* and 65 volumes of *acetonitrile.*

Test solution. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 30 mg of pioglitazone, add about 20 ml of *water* and mix with the aid of ultrasound. Add about 150 ml of the solvent mixture and mix with the aid of ultrasound for 15 minutes. Dilute to 250.0 ml with the solvent mixture.

Reference solution. A 0.015 per cent w/v solution of *pioglitazone hydrochloride RS* in the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) ,
- mobile phase: a mixture of 35 volumes of a buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen orthophosphate* and 1.15 g of *diammonium hydrogen phosphate* in 1000 ml of *water*, adding 1.0 ml of *triethylamine* and adjusting the pH to 5.0 with *orthophosphoric acid*, and 65 volumes of *acetonitrile*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 270 nm,

– injection volume. 20 µl.

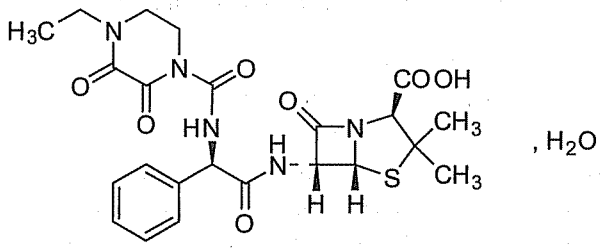
Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{19}H_{20}N_2O_3S$ in the tablets.

Labelling. The label states the strength in terms of the equivalent amount of pioglitazone.

Piperacillin



$C_{23}H_{27}N_5O_7S,H_2O$ Mol.Wt. 535.6

Piperacillin is (6*R*)-6-[*R*-2-(4-ethyl-2,3-dioxopiperazine-1-carboxamido)-2-phenylacetamido]penicillanic acid monohydrate.

Piperacillin contains not less than 96.0 per cent and not more than 102.0 per cent of $C_{23}H_{27}N_5O_7S$, calculated on the anhydrous basis.

Category. Penicillin antibacterial.

Description. A white or almost white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *piperacillin RS or* with the reference spectrum of piperacillin.

Tests

Appearance of solution. A 10 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1) and not more intensely coloured than the reference solution BS8 (2.4.1).

Specific optical rotation (2.4.22). + 165° to + 175°, determined in a 1.0 per cent w/v solution in *methanol.*

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Use freshly prepared solutions.

Solvent mixture. 25 volumes of *acetonitrile* and 75 volumes of 3.12 per cent w/v solution of *sodium dihydrogen phosphate.*

Test solution (a). Dissolve 25 mg of the substance under examination in 50 ml of the solvent mixture.

Test solution (b). Dissolve 40 mg of the substance under examination in 20 ml of the solvent mixture.

Reference solution (a). A 0.05 per cent w/v solution of *piperacillin RS* in the solvent mixture.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 25 ml with the solvent mixture.

Reference solution (c). Dissolve 10 mg of *piperacillin RS* and 10 mg of *anhydrous ampicillin RS* (*piperacillin impurity A RS*) in 50 ml solvent mixture.

Reference solution (d). Dilute 1.0 ml of reference solution (a) to 100 ml with the solvent mixture. Dilute 1.0 ml of this solution to 50 ml with the solvent mixture.

Chromatographic system

– a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
– mobile phase: A. a mixture of 576 volumes of *water,* 200 volumes of 3.12 per cent w/v solution of *sodium dihydrogen phosphate* and 24 volumes of an 8.0 per cent w/v solution of *tetrabutylammonium hydroxide,* adjusted to pH 5.5 with *dilute phosphoric acid* or *dilute sodium hydroxide solution*; add 200 volumes of *acetonitrile,*

B. a mixture 126 volumes of *water,* 200 volumes of a 3.12 per cent w/v solution of *sodium dihydrogen phosphate* and 24 volumes of an 8.0 per cent w/v solution of *tetrabutylammonium hydroxide,* adjusted to pH 5.5 with *dilute phosphoric acid* or *dilute sodium hydroxide solution*; add 650 volumes of *acetonitrile,*.

– a linear gradient programme using the conditions given below,
– flow rate. 1 ml per minute,
– spectrophotometer set at 220 nm,
– injection volume. 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
$0 - t_g$	88	12
$t_g - (t_g + 30)$	88→0	12→100
$(t_g + 30) - (t_g - 45)$	0→88	100→12

where, t_g = retention time of piperacillin determined with reference solution (b)

Inject reference solution (b), (c) and (d). The test is not valid unless the resolution between the peaks due to piperacillin impurity A and piperacillin in the chromatogram obtained with

reference solution (c) is not less than 10; signal-to-noise ratio is not less than 3 for the principal peak in the chromatogram obtained with reference solution (d); mass distribution ratio is (2:3) for the peak due to piperacillin in the chromatogram obtained with reference solution (c). The area of any secondary peak is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent).

***N,N*-Dimethylaniline** (2.3.21). Not more than 20 ppm.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Water. (2.3.43). 2.0 per cent to 4.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14), as described in the test for Related substances.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject test solution (a) and reference solution (a).

Calculate the content of $C_{23}H_{27}N_5O_7S$.

Storage. Store protected from light and moisture.

Piperacillin Intravenous Infusion

Piperacillin Intravenous Infusion is a sterile solution of Piperacillin Sodium in Water for Injections. It is prepared by dissolving Piperacillin for Intravenous Infusion in the requisite amount of Water for Injections before use.

The intravenous infusion complies with the requirements stated under Parenteral Preparations (Injections).

Piperacillin for Intravenous Infusion

Piperacillin for Intravenous Infusion is a sterile material consisting of Piperacillin Sodium or Piperacillin Sodium prepared by the interaction of piperacillin with *sodium bicarbonate*, with or without excipients. It is filled in a sealed container.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parental Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Piperacillin for Intravenous Infusion contains not less than 94.0 per cent and not more than 115.0 per cent of the stated amount of piperacillin, $C_{23}H_{27}N_5O_7S$.

Usual strengths. 1 g per vial; 2 g per vial; 4 g per vial.

The contents of the sealed container comply with the requirements stated under Parental Preparations (Powder for Injections) and with the following requirements.

Identification

A. Dissolve a quantity of the powder containing about 0.25 g of anhydrous piperacillin in 20 ml of *water*, add 0.5 ml of *dilute hydrochloric acid,* mix well, allow to stand until a precipitate appears and filter. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *piperacillin RS* or with the reference spectrum of piperacillin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

C. Gives the reaction of sodium (2.3.1).

Tests

pH (2.4.24). 4.8 to 6.8, determined in a 10.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powder containing about 39 mg of anhydrous piperacillin in 100 ml of the mobile phase.

Reference solution (a). A 0.0008 per cent w/v solution of *piperacillin RS* in the mobile phase.

Reference solution (b). A 0.0004 per cent w/v solution of *piperacillin RS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 to 10 µm), (Such as Beckman Ultrasphere ODS),
- mobile phase: a mixture of 0.3 volume of *0.4 M tetrabutylammonium hydroxide*,, 10 volumes of *0.2 M sodium dihydrogen orthophosphate monohydrate*, 44.7 volumes of *water* and 45 volumes of *methanol,* cool and adjust to pH 5.5 with *orthophosphoric acid,*
- flow rate. 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume. 10 µl.

Inject the test solution, reference solution (a) and (b). In the chromatogram obtained with the test solution the area of the peak with a relative retention time of about 0.6 is not more than 3.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.5 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (2 per cent).

Water (2.3.43). Not more than 2.0 per cent, determined on 0.5 g.

Bacterial endotoxins (2.2.3). Not more than 2.5 Endotoxin Units per ml of a solution prepared in the following manner. Dissolve a quantity in *water BET* to obtain a solution containing 50 mg of piperacillin per ml. Carry out the test using Maximum Valid dilution of this solution calculated from the declared sensitivity of the lysate used in the test.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powder containing about 39 mg of anhydrous piperacillin in 100 ml of the mobile phase.

Reference solution (a). Dissolve 40 mg of *piperacillin RS* in *methanol* and dilute to 100 ml with the mobile phase.

Reference solution (b). A solution containing 0.01 per cent w/v of *anhydrous ampicillin RS* and 0.02 per cent w/v of *piperacillin RS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm), (Such as Beckman Ultrasphere ODS),
- mobile phase: a mixture of 0.3 volume of *0.4 M tetrabutylammonium hydroxide*, 10 volumes of *0.2 M sodium dihydrogen orthophosphate monohydrate*, 44.7 volumes of *water* and 45 volumes of *methanol*, cool and adjust to pH 5.5 with *orthophosphoric acid*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume. 10 µl.

Inject reference solution (b). The resolution between the peaks due to anhydrous ampicillin and piperacillin is not less than 16.

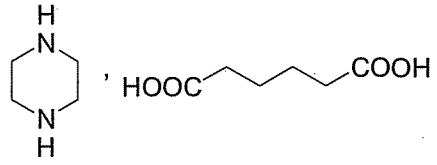
Inject the test solution and the reference solution (a).

Calculate the content of $C_{23}H_{27}N_5O_7S$.

Storage. Store protected from moisture.

Labelling. The label of the sealed container states the quantity of active ingredient contained in it in terms of the equivalent amount of anhydrous piperacillin.

Piperazine Adipate



$C_4H_{10}N_2, C_6H_{10}O_4$ Mol. Wt. 232.3

Piperazine Adipate contains not less than 98.0 per cent and not more than 101.0 per cent of $C_4H_{10}N_2$, $C_6H_{10}O_4$, calculated on the anhydrous basis.

Category. Anthelmintic.

Description. A white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *piperazine adipate RS* or with the reference spectrum of piperazine adipate.

B. In the test for Related substances, examine the plate after spraying with both the *ninhydrin* and *iodine* solutions. The principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

C. Dissolve 0.1 g in 5 ml of *water*, add 0.5 g of *sodium bicarbonate*, 0.5 ml of a freshly prepared 5.0 per cent w/v solution of *potassium ferricyanide* and 0.1 ml of *mercury*, shake vigorously for 1 minute and allow to stand for 20 minutes; a reddish colour slowly develops.

Tests

Appearance of solution. A 5.0 per cent w/v solution is clear (2.4.1), and not more intensely coloured than reference solution BS8 (2.4.1).

pH (2.4.24). 5.0 to 6.0, determined in a 5.0 per cent w/v solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. 60 volumes of *strong ammonia solution* and 40 volumes of *ethanol*.

Mobile phase. A freshly prepared mixture of 80 volumes of *acetone* and 20 volumes of *strong ammonia solution*.

Test solution (a). Dissolve 1 g of the substance under examination in 10 ml of the solvent mixture.

Test solution (b). Dissolve 1 g of the substance under examination in 100 ml of the solvent mixture.

Reference solution (a). A 1 per cent w/v solution of *piperazine adipate RS* in the solvent mixture.

Reference solution (b). A 0.025 per cent w/v solution of *ethylenediamine* in the solvent mixture.

Reference solution (c). A 0.025 per cent w/v solution of *triethylenediamine* in the solvent mixture.

Reference solution (d). A solution containing 0.025 per cent w/v of *triethylenediamine* and 1 per cent w/v of the substance under examination in the solvent mixture.

Apply to the plate 5 µl of each solution. After development, dry the plate at 105°, spray with a 0.3 per cent w/v solution of *ninhydrin* in a mixture of 3 volumes of *anhydrous acetic acid* and 100 volumes of *1-butanol* and then with a 0.15 per cent w/v solution of *ninhydrin* in *ethanol* and dry at 105° for 10 minutes. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b). Spray the plate with *0.05 M iodine* and allow to stand for about 10 minutes. Any spot corresponding to *triethylenediamine* in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (c). The test is not valid unless the chromatogram obtained with reference solution (d) shows two separated spots. Ignore any spot remaining on the line of application.

Heavy metals (2.3.13). Dissolve 1.0 g in 20 ml of *water*, 0.5 ml of *0.1 M hydrochloric acid* and add sufficient *water* to produce 25 ml. The resulting solution complies with the limit test for heavy metals, Method A (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 1.0 g.

Assay. Weigh accurately about 0.2 g, dissolve in 10 ml of *anhydrous glacial acetic acid* with gentle heating and dilute to 70 ml with the same solvent. Titrate with *0.1 M perchloric acid*, using 0.25 ml of *1-naphtholbenzein solution* as indicator and titrating until the colour of the solution changes from brownish yellow to green. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01161 g of $C_4H_{10}N_2$, $C_6H_{10}O_4$.

Storage. Store protected from moisture.

Piperazine Adipate Tablets

Piperazine Adipate Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of piperazine hydrate, $C_4H_{10}N_2$, $6H_2O$.

Usual strength. The equivalent of 300 mg of piperazine hydrate. (144 mg of Piperazine Adipate is approximately equivalent to 120 mg of Piperazine Hydrate).

Identification

A. Extract a quantity of the powdered tablets containing 1 g of Piperazine Hydrate with 20 ml of *water* and filter. Dilute 1 ml of the filtrate to 5 ml with *water*, add 0.5 g of *sodium bicarbonate*, 0.5 ml of a freshly prepared 5.0 per cent w/v solution of *potassium ferricyanide* and 0.1 ml of *mercury*, shake vigorously for 1 minute and allow to stand for 20 minutes; a reddish colour slowly develops.

B. To 10 ml of the filtrate obtained in test A add 5 ml of *hydrochloric acid* and extract with three quantities, each of 10 ml, of *ether*, evaporate the combined *ether* extracts to dryness; the residue, after washing with a small volume of *water* and drying at 105°, melts at about 152° (2.4.21).

Tests

Other tests. Comply with the tests stated under Tablets.

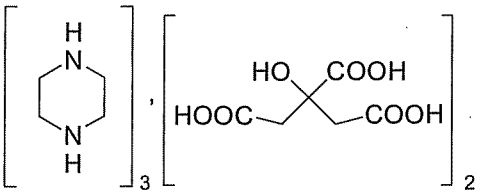
Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 0.2 g of Piperazine Hydrate, shake with 10 ml of *water* for 1 hour, filter and wash the residue with two quantities, each of 10 ml, of *water*. To the combined extract and washings add 5 ml of *1 M sulphuric acid* and 50 ml of *picric acid solution*, bring to boil, allow to stand for 1 hour and filter through a sintered-glass crucible (porosity No. 4) and wash the residue with successive quantities, each of 10 ml, of a mixture of equal volumes of a saturated solution of *picric acid* and *water* until the washings are free from sulphate. Wash with five quantities, each of 10 ml, of *ethanol* and dry to constant weight at 105°.

1 g of the residue is equivalent to 0.3567 g of $C_4H_{10}N_2$, $6H_2O$.

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the equivalent amount of piperazine hydrate.

Piperazine Citrate



$(C_4H_{10}N_2)_3,2C_6H_8O_7$ Mol. Wt. 642.7 (anhydrous)

Piperazine Citrate is a salt of piperazine with citric acid containing a variable amount of water of crystallisation.

Piperazine Citrate contains not less than 98.0 per cent and not more than 101.0 per cent of $(C_4H_{10}N_2)_3$, $2C_6H_8O_7$, calculated on the anhydrous basis.

Category. Anthelmintic.

Dose. For an adult, in the treatment of threadworm infestation, equivalent of 1 to 2 g of Piperazine Hydrate daily, in divided doses for 7 days; in the treatment of roundworm infestation, equivalent of 4.5 g of Piperazine Hydrate as a single dose. For a child, in the treatment of threadworm infestation, the

equivalent of 40 mg of Piperazine Hydrate per kg of body weight daily, in divided doses for 7 days; in the treatment of roundworm infestation, as a single dose, the equivalent of 120 mg of Piperazine Hydrate per kg of body weight, up to a maximum dose of 4 g.

(150 mg of Piperazine Citrate or 132 mg of anhydrous piperazine citrate is approximately equivalent to 120 mg of Piperazine Hydrate).

Description. A white, granular powder; almost odourless.

Identification

Test A may be omitted if tests B and C are carried out. Test B may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *piperazine citrate RS* or with the reference spectrum of piperazine citrate.

B. In the test for Related substances, examine the plate after spraying with both the ninhydrin solutions. The principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

C. A 10 per cent w/v solution gives the reactions of citrates (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution is clear (2.4.1), and not more intensely coloured than reference solution BS8 (2.4.1).

pH (2.4.24). 5.0 to 6.0, determined in a 5.0 per cent w/v solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G.*.

Solvent mixture. 60 volumes of *strong ammonia solution* and 40 volumes of *ethanol.*

Mobile phase. A freshly prepared mixture of 80 volumes of *acetone* and 20 volumes of *strong ammonia solution.*

Test solution (a). Dissolve 1 g of the substance under examination in 10 ml of the solvent mixture.

Test solution (b). Dissolve 1 g of the substance under examination in 100 ml of the solvent mixture.

Reference solution (a). A 1.0 per cent w/v solution of *piperazine citrate RS* in the solvent mixture.

Reference solution (b). A 0.025 per cent w/v solution of *ethylenediamine* in the solvent mixture.

Reference solution (c). A 0.025 per cent w/v solution of *triethylenediamine* in the solvent mixture.

Reference solution (d). A solution containing 0.025 per cent w/v of *triethylenediamine* and 1 per cent w/v of the substance under examination in the solvent mixture.

Apply to the plate 5 µl of each solution. After development, dry the plate at 105°, spray with a 0.3 per cent w/v solution of *ninhydrin* in a mixture of 3 volumes of *anhydrous acetic acid* and 100 volumes of *1-butanol* and then with a 0.15 per cent w/v solution of *ninhydrin* in *ethanol* and dry at 105° for 10 minutes. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b). Spray the plate with *0.05 M iodine* and allow to stand for about 10 minutes. Any spot corresponding to *triethylenediamine* in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (c). The test is not valid unless the chromatogram obtained with reference solution (d) shows two separated spots. Ignore any spot remaining on the line of application.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method A (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.4.19). 10.0 to 14.0 per cent, determined on 0.3 g.

Assay. Weigh accurately about 0.2 g, dissolve in 10 ml of *anhydrous glacial acetic acid* with gentle heating and dilute to 70 ml with the same solvent. Titrate with *0.1 M perchloric acid*, using 0.25 ml of *1-naphtholbenzein solution* as indicator and titrating until the colour of the solution changes from brownish yellow to green. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01071 g of $(C_4H_{10}N_2)_3, 2C_6H_8O_7$.

Storage. Store protected from light and moisture.

Piperazine Citrate Syrup

Piperazine Citrate Oral Solution; Piperazine Citrate Elixir

Piperazine Citrate Syrup is a solution of Piperazine Citrate in a suitable flavoured Vehicle.

Piperazine Citrate Syrup contains the equivalent of not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of piperazine hydrate, $C_4H_{10}N_2, 6H_2O$.

Usual strength. The equivalent of 750 mg of piperazine hydrate in 5 ml.

(125 mg of Piperazine Citrate or 110 mg of anhydrous piperazine citrate is approximately equivalent to 100 mg of Piperazine Hydrate).

Identification

A. To 1 ml add 5 ml of *2 M hydrochloric acid* and, with stirring, 1 ml of a freshly prepared 50 per cent w/v solution of *sodium nitrite*, cool in ice for 15 minutes, induce crystallisation, wash

the crystalline precipitate with *water* and dry at 105°. The crystals melt at about 159° (2.4.21).

B. Warm 10 ml with *activated charcoal* and filter. Boil a portion of the filtrate with an excess of *mercuric sulphate solution*, filter, boil the filtrate and add 0.25 ml of *dilute potassium permanganate solution*; the permanganate solution is decolorised and a white precipitate is produced.

C. Acidify a portion of the filtrate obtained in test B with *1 M sulphuric acid*, add 0.25 ml of *dilute potassium permanganate solution*, warm until the colour is discharged and add an excess of *bromine water*; a white precipitate is produced either immediately or on cooling.

Tests

Other tests. Complies with the tests stated under Oral Liquids.

Assay. Weigh accurately a quantity containing about 0.2 g of Piperazine Hydrate, add 3.5 ml of *0.5 M sulphuric acid* and 10 ml of *water*, add 100 ml of *picric acid solution*, heat on a water-bath for 15 minutes, allow to stand for 1 hour and filter through a sintered-glass crucible (porosity No. 4). Wash the residue with successive quantities, each of 10 ml, of a mixture of equal volumes of a saturated solution of *picric acid* and *water* until the washings are free from sulphate. Wash the residue with five quantities, each of 10 ml, of *ethanol* and dry to constant weight at 105°.

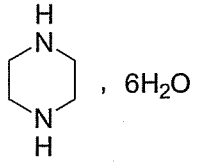
1 g of the residue is equivalent to 0.3567 g of $C_4H_{10}N_2, 6H_2O$.

Determine the weight per ml of the syrup (2.4.29), and calculate the content of $C_4H_{10}N_2, 6H_2O$, weight in volume.

Storage. Store protected from light.

Labelling. The label states the strength in terms of the equivalent amount of piperazine hydrate.

Piperazine Hydrate



$C_4H_{10}N_2, 6H_2O$ Mol. Wt. 194.2

Piperazine Hydrate contains not less than 98.0 per cent and not more than 101.0 per cent of $C_4H_{10}N_2, 6H_2O$.

Category. Anthelmintic.

Dose. For an adult, in the treatment of threadworm infestation, 1 to 2 g daily, in divided doses for 7 days; in the treatment of roundworm infestation, 4 g as a single dose. For a child, in the treatment of threadworm infestation, 40 mg per kg of body weight daily, in divided doses for 7 days. In the treatment of roundworm infestation, as a single dose, 120 mg per kg of body weight, up to a maximum dose of 4 g.

Description. Colourless, glassy deliquescent crystals.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *piperazine hydrate RS*.

B. In the test for Related substances, examine the plate after spraying with both the ninhydrin solutions. The principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

C. Dissolve 0.2 g in 5 ml of *dilute hydrochloric acid*, add 0.5 g of *sodium nitrite* and heat to boiling. Cool in ice for 15 minutes, scratching the walls of the container with a glass rod and filter. The crystals, after washing with 10 ml of ice-cold *water* and drying at 105°, melt at about 159° (2.4.21).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and not more intensely coloured than reference solution BS8 (2.4.1).

pH (2.4.24). 10.5 to 12.0, determined in a 5.0 per cent w/v solution in *carbon dioxide-free water*.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. 60 volumes of *strong ammonia solution* and 40 volumes of *ethanol*.

Mobile phase. A freshly prepared mixture of 80 volumes of *acetone* and 20 volumes of *strong ammonia solution*.

Test solution (a). Dissolve 1 g of the substance under examination in 10 ml of the solvent mixture.

Test solution (b). Dissolve 1 g of the substance under examination in 100 ml of the solvent mixture.

Reference solution (a). A 1 per cent w/v solution of *piperazine hydrate RS* in the solvent mixture.

Reference solution (b). A 0.025 per cent w/v solution of *ethylenediamine* in the solvent mixture.

Reference solution (c). A 0.025 per cent w/v solution of *triethylenediamine* in the solvent mixture.

Reference solution (d). A solution containing 0.025 per cent w/v of *triethylenediamine* and 1 per cent w/v of the substance under examination in the solvent mixture.

Apply to the plate 5 µl of each solution. After development, dry the plate at 105°, spray with a 0.3 per cent w/v solution of *ninhydrin* in a mixture of 3 volumes of *anhydrous acetic acid* and 100 volumes of *1-butanol* and then with a 0.15 per cent w/v solution of *ninhydrin* in *ethanol* and dry at 105° for 10 minutes. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (b). Spray the plate with *0.05 M iodine* and allow to stand for about 10 minutes. Any spot corresponding to triethylenediamine in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (c). The test is not valid unless the chromatogram obtained with reference solution (d) shows two separated spots. Ignore any spot remaining on the line of application.

Heavy metals (2.3.13).1.0 g complies with the limit test for heavy metals, Method A (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Weigh accurately about 0.2 g, dissolve in 10 ml of *anhydrous glacial acetic acid* with gentle heating and dilute to 70 ml with the same solvent. Titrate with *0.1 M perchloric acid*, using 0.25 ml of *1-naphtholbenzein solution* as indicator and titrating until the colour of the solution changes from brownish yellow to green. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.009705 g of $C_4H_{10}N_2, 6H_2O$.

Storage. Store protected from light and moisture.

Piperazine Phosphate

$C_4H_{10}N_2, H_3PO_4, H_2O$ Mol. Wt. 202.2

Piperazine Phosphate contains not less than 98.5 per cent and not more than 100.5 per cent of $C_4H_{10}N_2, H_3PO_4$, calculated on the anhydrous basis.

Category. Anthelmintic.

Dose. For an adult, in the treatment of threadworm infestation, the equivalent of 1 to 2 g of Piperazine Hydrate daily, in divided doses for 7 days; in the treatment of roundworm infestation, the equivalent of 4.5 g of Piperazine Hydrate as a single dose. For a child, in the treatment of threadworm infestation, the equivalent of 40 mg of Piperazine Hydrate per kg of body weight daily, in divided doses for 7 days; in the treatment of roundworm infestation, as a single dose, the equivalent of 120 mg of Piperazine Hydrate per kg of body weight, up to a maximum dose of 4 g.

(125 mg of piperazine phosphate is approximately equivalent to 120 mg of Piperazine Hydrate).

Description. A white, crystalline powder; odourless or almost odourless.

Identification

A. Dissolve 0.2 g in 5 ml of *dilute hydrochloric acid*, add 0.5 g of *sodium nitrite* and heat to boiling. Cool in ice for 15 minutes, scratching the walls of the container with a glass rod and filter. The crystals, after washing with 10 ml of ice-cold *water* and drying at 105°, melt at about 159° (2.4.21).

B. Dissolve 0.1 g in 5 ml of *water*, add 0.5 g of *sodium bicarbonate*, 0.5 ml of a freshly prepared 5.0 per cent w/v solution of *potassium ferricyanide* and 0.1 ml of *mercury*, shake vigorously for 1 minute and allow to stand for 20 minutes; a reddish colour slowly develops.

C. Gives the reactions of phosphates (2.3.1).

Tests

pH (2.4.24). 6.0 to 6.5, determined in a 1.0 per cent w/v solution.

Heavy metals (2.3.13). Dissolve 1.0 g in 20 ml of *2 M acetic acid* and add sufficient *water* to produce 25 ml. The solution complies with the limit test for heavy metals, Method A (20 ppm).

Water (2.3.43). 8.0 to 9.5 per cent, determined on 0.25 g.

Assay. Weigh accurately about 0.2 g, dissolve in a mixture of 3.5 ml of *0.5 M sulphuric acid* and 10 ml of *water*. Add 100 ml of *picric acid solution*, heat on a water-bath for 15 minutes and allow to stand for 1 hour. Filter through a sintered-glass crucible (porosity No. 4) and wash the residue with successive quantities, each of 10 ml, of a mixture of equal volumes of a saturated solution of *picric acid* and *water* until the washings are free from sulphate. Wash the residue with five quantities, each of 10 ml, of *ethanol* and dry to constant weight at 105°.

1 g of the residue is equivalent to 0.3382 g of $C_4H_{10}N_2, H_3PO_4$.

Storage. Store protected from moisture.

Piperazine Phosphate Tablets

If the tablets are intended to be chewed before swallowing they may contain suitable flavouring agents.

Piperazine Phosphate Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of piperazine phosphate, $C_4H_{10}N_2, H_3PO_4, H_2O$.

Usual strengths. The equivalent of 260 mg; 520 mg Piperazine Hydrate (125 mg of piperazine phosphate is approximately equivalent to 120 mg of Piperazine Hydrate).

Identification

Extract a quantity of the powdered tablets containing 1 g of Piperazine Phosphate with 20 ml of *water* and filter. The filtrate complies with the following tests.

A. To 4 ml of the filtrate, add 1 ml of *hydrochloric acid*, 0.5 g of *sodium nitrite* and heat to boiling. Cool in ice for 15 minutes, scratching the walls of the container with a glass rod and filter. The crystals, after washing with 10 ml of ice-cold *water* and drying at 105°, melt at about 159° (2.4.21).

B. Dilute 1 ml of the filtrate to 5 ml with *water*, add 0.5 g of *sodium bicarbonate*, 0.5 ml of a freshly prepared 5.0 per cent w/v solution of *potassium ferricyanide* and 0.1 ml of *mercury*, shake vigorously for 1 minute and allow to stand for 20 minutes; a reddish colour slowly develops.

C. Gives the reactions of phosphates (2.3.1).

Tests

Disintegration. The test does not apply to Piperazine Phosphate Tablets intended to be chewed before swallowing.

Other tests. Comply with the tests stated under Tablets.

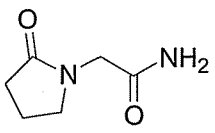
Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 0.15 g of Piperazine Phosphate, shake with 10 ml of *water* for 1 hour, filter and wash the residue with two quantities, each of 10 ml, of *water*. To the combined extract and washings add 5 ml of *1 M sulphuric acid* and 50 ml of *picric acid solution*, boil, allow the mixture to stand for several hours and filter through a sintered glass crucible (porosity No. 4). Wash the residue with successive quantities, each of 10 ml, of a mixture of equal volumes of a saturated solution of *picric acid* and *water* until the washings are free from sulphate. Wash the residue with five quantities, each of 10 ml, of *ethanol (95 per cent)* and dry to constant weight at 105°.

1 g of the residue is equivalent to 0.3714 g of $C_4H_{10}N_2$, H_3PO_4, H_2O.

Storage. Store protected from moisture.

Labelling. The label states, where applicable, that the tablets are to be chewed before swallowing.

Piracetam



$C_6H_{10}N_2O_2$ Mol.Wt.142.2

Piracetam is 2-(2-oxopyrrolidin-1-yl)acetamide.

Piracetam contains not less than 98.0 per cent and not more than 102.0 per cent of $C_6H_{10}N_2O_2$, calculated on the dried basis.

Description. A white or almost white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *piracetam RS* or with the reference spectrum of piracetam.

Tests

Appearance of solution. A 20.0 per cent w/v solution in *water* is clear (2.4.1) and colourless (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of 10 volumes of *acetonitrile* and 90 volumes of *water*.

Test solution (a). Dissolve 50.0 mg of the substance under examination in 100.0 ml of the solvent mixture.

Test solution (b). Dilute 10.0 ml of test solution (a) to 50.0 ml with the solvent mixture.

Reference solution (a). Dissolve 5 mg of the substance under examination and 10 µl of 2-pyrrolidone in sufficient solvent mixture to produce 100.0 ml.

Reference solution (b). Dilute 1.0 ml of test solution (a) to 100.0 ml with the solvent mixture. Dilute 5.0 ml of this solution to 50.0 ml with the solvent mixture.

Reference solution (c). Dissolve 50.0 mg of *piracetam RS* in 100.0 ml of the solvent mixture. Dilute 10.0 ml of this solution to 50.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with end capped octadecylsilane bonded to silica (5 µm),
- mobile phase: a mixture of 10 volumes of *acetonitrile* and 90 volumes of 0.1 per cent w/v solution of *dipotassium hydrogen phosphate*, adjusted to pH 6.0 with *orthophosphoric acid*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume. 20 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to 2-pyrrolidone and piracetam is not less than 3.0 and the symmetry factor is not more than 2.0 for the peak due to piracetam.

Inject test solution (a) and reference solution (b). Run the chromatogram for 8 times the retention time of piracetam. In the chromatogram obtained with the test solution (a), the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (b) (0.1 per cent) and the sum of areas of all the secondary

peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy Metals (2.3.13). 2.0 g complies with limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14) as described in the test for Related substances.

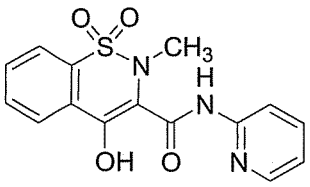
Inject reference solution (c). The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject test solution (b) and reference solution (c).

Calculate the content of $C_6H_{10}N_2O_2$.

Storage. Store protected from light and moisture.

Piroxicam



$C_{15}H_{13}N_3O_4S$ Mol. Wt. 331.4

Piroxicam is 4-hydroxy-2-methyl-*N*-(2-pyridyl)-2*H*-1,2-benzothiazine-3-carboxamide-1,1-dioxide.

Piroxicam contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{15}H_{13}N_3O_4S$, calculated on the anhydrous basis.

Category. Analgesic; antiinflammatory; antipyretic.

Dose. 10 to 20 mg daily.

Description. An off-white to light tan or light yellow powder; odourless.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *piroxicam RS* or with the reference spectrum of piroxicam.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *0.01 M methanolic hydrochloric acid* shows absorption maxima at about 242 nm and 334 nm and a minimum at about 270 nm; absorbance at about 334 nm, about 0.87.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 95 volumes of *toluene* and 5 volumes of *acetic acid*.

Test solution. Dissolve 0.1 g of the substance under examination in 100 ml of a mixture of equal volumes of *chloroform* and *methanol*.

Reference solution. A 0.1 per cent w/v solution of *piroxicam RS* in a mixture of equal volumes of *chloroform* and *methanol*.

Apply to the plate 20 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 75 mg of the substance under examination in 50.0 ml of *acetonitrile*.

Reference solution. Dilute 1.0 ml of the test solution to 10.0 ml with *acetonitrile*. Dilute 1.0 ml of this solution to 50.0 ml with *acetonitrile*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- column temperature. 40°,
- mobile phase: a mixture of 40 volumes of *acetonitrile* and 60 volumes of a 0.7 per cent w/v solution of *potassium dihydrogen phosphate*, adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the symmetry factor of the peak due to piroxicam impurity B is not more than 5.0. The relative retention time with reference to piroxicam for piroxicam impurity B is about 0.85.

Inject the test solution and the reference solution. Run the chromatogram 5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the sum of all the secondary peaks is not

more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.02 per cent).

Heavy metals (2.3.13). 0.4 g complies with the limit test for heavy metals, Method B (50 ppm).

Sulphated ash (2.3.18). Not more than 0.3 per cent.

Water (2.3.43). Not more than 0.5 per cent , determined on 2.0 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. A 0.005 per cent w/v solution of the substance under examination in *0.1 M methanolic hydrochloric acid.*

Reference solution. A 0.005 per cent w/v solution of *piroxicam RS* in *0.1 M methanolic hydrochloric acid.*

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 45 volumes of *methanol* and 55 volumes of a buffer solution prepared by diluting a mixture of 7.72 g of *anhydrous citric acid* in 400 ml of *water* and 5.35 g of *sodium phosphate* in 100 ml of *water* to 1000 ml with *water,*
- flow rate. 1.2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject alternately the test solution and the reference solution.

Calculate the content of $C_{15}H_{13}N_3O_4S$.

Storage. Store protected from light and moisture.

Piroxicam Capsules

Piroxicam Capsules contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of piroxicam, $C_{15}H_{13}N_3O_4S$.

Usual strengths. 10 mg; 20 mg.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 95 volumes of *toluene* and 5 volumes of *acetic acid.*

Test solution. Dissolve a portion of the contents of the capsules in sufficient of a mixture of equal volumes of *chloroform* and *methanol* to obtain a solution containing about 0.1 per cent w/v of Piroxicam. Shake for 10 minutes, filter and use the filtrate.

Reference solution. A 0.1 per cent w/v solution of *piroxicam RS* in a mixture of equal volumes of *chloroform* and *methanol.*

Apply to the plate 20 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2,

Medium. 900 ml of *0.1 M hydrochloric acid,*

Speed and time. 100 rpm and 45 minutes.

Withdraw 10 ml of the medium and filter. Measure the absorbance of the filtrate (2.4.7), suitably diluted if necessary, at the maximum at about 242 nm. Calculate the content of $C_{15}H_{13}N_3O_4S$, in the medium taking 352 as the specific absorbance at 242 nm.

D. Not less than 75 per cent of the stated amount of $C_{15}H_{13}N_3O_4S$.

Uniformity of content. *(For capsules containing 10 mg or less)*— Comply with the test stated under Capsules.

Test solution. Dissolve the contents of a capsule in 100.0 ml of *0.1 M methanolic hydrochloric acid* and filter. Dilute further if necessary.

Determine by liquid chromatography (2.4.14) using the chromatographic system and the reference solution described under Assay.

Calculate the content of $C_{15}H_{13}N_3O_4S$ in the capsule.

Water (2.3.43). Not more than 8.0 per cent, determined on 0.25 g.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve an accurately weighed quantity of the mixed contents of the capsules containing about 50 mg of Piroxicam in 100.0 ml of *0.1 M methanolic hydrochloric acid.* Further dilute 1.0 ml of the solution to 10.0 ml with the same solvent.

Reference solution. A 0.005 per cent w/v solution of *piroxicam RS* in *0.1 M methanolic hydrochloric acid.*

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),

- mobile phase: a mixture of 45 volumes of *methanol* and 55 volumes of a buffer solution prepared by diluting a mixture of 7.72 g of *anhydrous citric acid* in 400 ml of *water* and 5.35 g of *sodium phosphate* in 100 ml of *water* to 1000 ml with *water*;
- flow rate. 1.2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject alternately the test solution and the reference solution.

Calculate the content of $C_{15}H_{13}N_3O_4S$ in the capsules.

Storage. Store protected from light and moisture.

Plaster of Paris

Dried Calcium Sulphate; Exsiccated Calcium Sulphate

$CaSO_4, ½H_2O$ Mol. Wt. 145.1

Plaster of Paris is prepared by heating powdered gypsum, $CaSO_4,½H_2O$, at about 150° in a controlled manner such that it is substantially converted into the hemihydrate, $CaSO_4,½H_2O$, with minimum production of the anhydrous phases of calcium sulphate. It may contain suitable accelerators or decelerators.

Category. Surgical aid.

Description. A white or almost white powder; odourless or almost odourless; hygroscopic.

Identification

Gives the reactions of calcium salts and of sulphates (2.3.1).

Tests

pH (2.4.24). 6.5 to 9.0, determined in a 20.0 per cent w/v slurry in *water*.

Acid insoluble matter. Dissolve 0.5 g in 30 ml of a mixture of 1 volume of *hydrochloric acid* and 2 volumes of *water* and evaporate to dryness in a dish on a water-bath. Heat for 2 hours at 120° and again add 20 ml of the acid mixture. Warm for a few minutes and filter. Wash the residue with warm *water* until free from chlorides, dry, ignite and weigh. The residue weighs not more than 5 mg (1.0 per cent).

Setting properties. 20 g mixed with 10 ml of *water* at 15° to 20° in a cylindrical mould about 2.4 cm in diameter sets in not less than 4 minutes and not more than 6 minutes. The mass thus formed, after standing for 3 hours, possesses sufficient hardness to resist pressure of the fingers at the edges, which retain their sharpness of outline and do not crumble under pressure.

Loss on ignition (2.4.20). 4.5 to 8.0 per cent, determined by igniting to constant weight at red heat.

Storage. Store protected from moisture.

Poloxamers

$(CH_2CH_2O)_a\,(CH(CH_3)CH_2OH)_b\,(CH_2CH_2O)_c\,H$

b is at least 15 and $(CH_2CH_2O)_{a+c}$ is varied from 20 to 90% by weight

Mol. Wt. ranges from 1000 to >16000

Poloxamers are polyethylenepropylpropyleneglycols.

Synthetic block copolymer of ethylene oxide and propylene oxide represented by the following general formula:

Poloxamer Type	Ethylene oxide units (a)	Propylene oxide units (b)	Content of oxyethylene (per cent)	Average relative molecular mass
124	10-15	18-23	44.8-48.6	2090-2360
188	75-85	25-30	79.9-83.7	7680-9510
237	60-68	35-40	70.5-74.3	6840-8830
338	137-146	42-47	81.4-84.9	12700-17400
407	95-105	54.60	71.5-74.9	9840-14600

A suitable antioxidant may be added.

Description. Poloxamer 124 is a colourless or almost colourless liquid and poloxamers 188, 237, 338, 407 are a white or almost white, waxy powder, microbeads or flakes.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *poloxamer RS* or with the reference spectrum of poloxamer.

B. Average relative molecular mass.

C. Oxypropylene: oxyethylene ratio.

Tests

Melting point (2.4.21). About 50° for poloxamers 188, 237, 338 and 407.

Appearance of solution. A 10.0 per cent w/v solution in *carbon dioxide-free water* (solution A) is not more intensely coloured than reference solution BYS7 (2.4.1).

pH (2.4.24). 5.0 to 7.5, determined in solution A.

Ethylene oxide, propylene oxide and dioxan. Determine by gas chromatography (2.4.13).

Ethylene oxide stock solution. Disperse about 0.5 g of *ethylene oxide RS* with 50.0 ml of *dimethyl sulphoxide.*

Ethylene oxide solution. Dilute 1.0 ml of the ethylene oxide stock solution to 250.0 ml with *dimethyl sulphoxide.*

Propylene oxide stock solution. Introduce about 7 ml of *dichloromethane* into a volumetric flask, add 0.5 g of *propylene oxide* and dilute to 10.0 ml with *dichloromethane.* Dilute 0.5 ml of this solution to 50.0 ml with *dimethyl sulphoxide.*

Propylene oxide solution. Dilute 1.0 ml of the propylene oxide stock solution to 50.0 ml with *dimethyl sulphoxide.*

Dioxan solution. Introduce 0.1 g of *dioxan* into a flask and dilute to 50.0 ml with *dimethyl sulphoxide.* Dilute 2.5 ml of this solution to 100.0 ml with *dimethyl sulphoxide.*

Mixture solution. Dilute a mixture of 6.0 ml of the ethylene oxide solution, 6.0 ml of the propylene oxide solution and 2.5 ml of the dioxan solution to 25.0 ml with *dimethyl sulphoxide.*

Test solution. To 1.0 g of the substance under examination in a head-space vial, add 4.0 ml of *dimethyl sulphoxide* and close the vial immediately.

Reference solution. To 1.0 g of the substance under examination in a head-space vial, add 2.0 ml of *dimethyl sulphoxide* and 2.0 ml of the mixture solution. Close the vial immediately.

Chromatographic system
- a fused silica column 50 m x 0.32 mm, packed with poly(dimethyl)(diphenyl)siloxane (film thickness 5 µm),
- temperature :
  column 70° to 240°,
  inlet port and detector at 250°,
- a flame ionisation detector,
- flow rate. 1.4 ml per minute using nitrogen as the carrier gas,

Head-space conditions
- equilibration temperature 110°,
- equilibration time 30 minutes,
- transfer line temperature 140°,
- pressurisation time 1 minute,
- injection time 0.05 minute.

Inject 1 µl of the gaseous phase of the test solution and the reference solution. The relative retention time with reference to ethylene oxide is about 6 minutes, for propylene oxide is about 1.3, for dichloromethane is about 1.6, for dioxan is about 3.0, for dimethyl sulphoxide is about 3.7.

The ethylene oxide is not more than 0.5 times the area of the corresponding peak in the chromatogram obtained with the reference solution (1 ppm); propylene oxide is not more than 0.5 times the area of the corresponding peak in the chromatogram obtained with the reference solution (5 ppm) and dioxan is not more than 0.5 times the area of the corresponding peak in the chromatogram obtained with the reference solution (10 ppm).

Average relative molecular mass. Weigh 15 g of the substance under examination into a 250-ml ground glass stoppered flask, add 25.0 ml of *phthalic anhydride solution* and a few glass beads and swirl to dissolve. Boil gently under a reflux condenser for 60 minutes, cool and add 2 quantities, each of 10 ml, of *pyridine*, through the condenser. Add 10 ml of *water*, mix and allow to stand for 10 minutes. Add 40.0 ml of *0.5 M sodium hydroxide* and 0.5 ml of a 1.0 per cent w/v solution of *phenolphthalein* in *pyridine*. Titrate with *0.5 M sodium hydroxide* to a light pink endpoint that persists for 15 second and record the volume of sodium hydroxide used (S). Prepare a blank. Record the volume of sodium hydroxide used (B). Calculate the average relative molecular mass using the following expression:

Oxypropylene:oxyethylene ratio. Nuclear magnetic resonance spectrometry (2.4.34).

Use a 10.0 per cent w/v solution of the substance under examination in *deuterated chloroform.* Record the average area of the doublet appearing at about 1.08 ppm due to the methyl groups of the oxypropylene units (A_1) and the average area of the composite band from 3.2 ppm to 3.8 ppm due to CH_2O groups of both the oxyethylene and oxypropylene units and the CHO groups of the oxypropylene units (A_2) with reference to the internal standard. Calculate the percentage of oxyethylene, by weight, in the sample under examination using the following expression:

Total ash (2.3.19). Not more than 0.4 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 1.0 g.

Storage. Store protected from moisture.

Labelling. The label states the type of poloxamer.

Polyethylene Glycol 1500

Macrogol 1500

Polyethylene Glycol 1500 is a mixture of the polycondensation products of ethylene oxide and water obtained under controlled conditions. It is represented by the formula $HOCH_2[CH_2OCH_2]_nCH_2OH$, where n is between 28 and 36.

Category. Pharmaceutical aid (ointment base).

Description. A white or creamy white, soft, wax-like solid; odour, faint and characteristic.

Tests

Appearance of solution (2.4.1). A 25.0 per cent w/v solution is not more intensely coloured than reference solution BYS6.

pH (2.4.24). 4.0 to 7.0, determined in a 5.0 per cent w/v solution.

Freezing point (2.4.11). 42° to 46°.

Hydroxyl value (2.3.27). 70 to 86, determined on 5.0 g.

Viscosity (2.4.28). 25 mm^2s^{-1} to 32 mm^2s^{-1}, determined at 100° by Method A using a U-tube viscometer (size D).

Arsenic (2.3.10). Mix 3.3 g with 3 g of *anhydrous sodium carbonate*, add 10 ml of *bromine solution* and mix thoroughly. Evaporate to dryness on a water-bath, gently ignite and dissolve the cooled residue in 16 ml of *brominated hydrochloric acid* and 45 ml of *water*. Remove the excess of bromine with 2 ml of *stannous chloride solution AsT*. The resulting solution complies with the limit test for arsenic (3 ppm).

Heavy metals (2.3.13). Dissolve 4.0 g in 5 ml of a 1.0 per cent w/v solution of *hydrochloric acid* and sufficient *water* to produce 25 ml. The solution complies with the limit test for heavy metals, Method A (5 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Storage. Store protected from moisture.

Polyethylene Glycol 4000

Macrogol 4000

Polyethylene Glycol 4000 is a mixture of the polycondensation products of ethylene oxide and water obtained under controlled conditions. It is represented by the formula $HOCH_2[CH_2OCH_2]_nCH_2OH$, where n is between 69 and 84.

Category. Pharmaceutical aid (ointment base).

Description. A creamy white, hard, wax-like solid, powder or flakes; odour, faint and characteristic.

Tests

Appearance of solution (2.4.1). A 20.0 per cent w/v solution is not more intensely coloured than reference solution BYS6.

pH (2.4.24). 4.5 to 7.5, determined in a 5.0 per cent w/v solution.

Freezing point (2.4.11). 53° to 56°.

Hydroxyl value (2.3.27). 30 to 36, determined on 20.0 g.

Viscosity (2.4.28). 76 mm^2s^{-1} to 110 mm^2s^{-1}, determined at 100° by Method A using a U-tube viscometer (size E).

Arsenic (2.3.10). Mix 3.3 g with 3 g of *anhydrous sodium carbonate*, add 10 ml of *bromine solution* and mix thoroughly. Evaporate to dryness on a water-bath, gently ignite and dissolve the cooled residue in 16 ml of *brominated hydrochloric acid* and 45 ml of *water*. Remove the excess of bromine with 2 ml of *stannous chloride solution AsT*. The resulting solution complies with the limit test for arsenic (3 ppm).

Heavy metals (2.3.13). Dissolve 4.0 g in 5 ml of a 1.0 per cent w/v solution of *hydrochloric acid* and sufficient *water* to produce 25 ml. The solution complies with the limit test for heavy metals, Method A (5 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Storage. Store protected from moisture.

Polyethylene Glycol 6000

Macrogol 6000

Polyethylene Glycol 6000 is a mixture of the polycondensation products of ethylene oxide and water obtained under controlled conditions. It is represented by the formula $HOCH_2[CH_2OCH_2]nCH_2OH$, where n is between 112 and 158.

Category. Pharmaceutical aid (ointment base and tablet excipient).

Description. A white to creamy white, wax-like solid or flakes; odour, faint and characteristic.

Tests

Appearance of solution (2.4.1). A 15.0 per cent w/v solution is not more intensely coloured than reference solution BYS6.

pH (2.4.24). 4.5 to 7.5, determined in a 5.0 per cent w/v solution.

Freezing point (2.4.11). 56° to 60°.

Viscosity (2.4.28). 250 mm^2s^{-1} to 390 mm^2s^{-1}, determined at 100° by Method A using a U-tube viscometer (size F).

Arsenic (2.3.10). Mix 3.3 g with 3 g of *anhydrous sodium carbonate*, add 10 ml of *bromine solution* and mix thoroughly. Evaporate to dryness on a water-bath, gently ignite and dissolve the cooled residue in 16 ml of *brominated hydrochloric acid* and 45 ml of *water*. Remove the excess of bromine with 2 ml of *stannous chloride solution AsT*. The resulting solution complies with the limit test for arsenic (3 ppm).

Heavy metals (2.3.13). Dissolve 4.0 g in 5 ml of a 1.0 per cent w/v solution of *hydrochloric acid* and sufficient *water* to produce 25 ml. The resulting solution complies with the limit test for heavy metals, Method A (5 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Storage. Store protected from moisture.

Polyoxyl 35 Castor Oil

Polyoxyl 35 Castor Oil contains mainly the tri-ricinoleate ester of ethoxylated glycerol, with smaller amounts of polyethylene glycol ricinoleate and the corresponding free glycols. It results from the reaction of glycerol ricinoleate with about 35 moles of ethylene oxide.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *polyoxyl 35 castor oil RS* or with the reference spectrum of polyoxyl 35 castor oil.

B. Dissolve about 0.1 g in 10 ml of *ethanolic potassium hydroxide solution*, boil for about 3 minutes and evaporate to dryness. The residue dissolve with 5 ml of *water*, yielding a clear solution. Add a few drops of *glacial acetic acid*; a white precipitate is formed.

C. To a 5 .0 per cent w/v solution, add *bromine solution*, dropwise, the *bromine* is decolorized.

Tests

Weight per ml (2.4.29). 1.05 to 1.06.

Viscosity (2.4.28). 600 to 850 centipoises at 25°, a capillary viscometer being used.

Acid value (2.3.23). Not more than 2.0.

Hydroxyl value (2.3.27). 65 to 80.

Saponification value (2.3.37). 60 to 75.

Iodine value (2.3.28). 25 to 35.

Heavy metals (2.3.13). Weigh about 2 g of the substance under examination in a crucible and add sufficient *sulphuric acid* to wet the substance, carefully ignite at a low temperature until thoroughly charred. Add to the carbonized mass 2 ml of *nitric acid* and 5 drops of *sulphuric acid*, and heat cautiously until white fumes no longer are evolved. Ignite, preferably in a muffle furnace, at 500° to 600°, until the carbon is completely burned off. Cool, add 4 ml of *dilute hydrochloric acid*, cover, digest on a steam-bath for 15 minutes, and slowly evaporate on a steam-bath to dryness. Moisten the residue with 1 drop of *hydrochloric acid*, add 10 ml of hot *water*, and digest for 2 minutes. Add *dilute ammonium hydroxide* dropwise until the solution is just alkaline to litmus paper, dilute with *water* to 25 ml, and adjust at pH 3.0 with *dilute acetic acid*, filter. Rinse the crucible and the filter with 10 ml of *water*, combine the filtrate and rinsing in a 50-ml Nessler cylinder, dilute with *water* to 40 ml, and mix.

To each of the cylinder containing the standard solution and the test solution, add 2 ml of pH 3.5 *acetate buffer*, then add 1.2 ml of *thioacetamide- glycerine* base , dilute with *water* to 50 ml, mix, allow to stand for 2 minutes, and view downward over a white surface: the colour of the solution obtained from the test solution is not more intense than that of the solution obtained from the standard solution, produced by treating 2 ml of *lead standard solution* (1 ppm) in a similar manner.

Sulphated ash (2.3.18). Not more than 0.3 per cent.

Water (2.3.43). Not more than 3.0 per cent, determined on 1 g.

Storage. Store protected from moisture.

Polyoxyl 40 Hydrogenated Castor Oil

Polyoxyl 40 Hydrogenated Castor Oil contains mainly the tri-hydroxystearate ester of ethoxylated glycerol, with smaller amounts of polyethylene glycol tri-hydroxystearate and of the corresponding free glycols. It results from the reaction of glycerol tri-hydroxystearate with about 40 to 45 moles of ethylene oxide.

Category. Pharmaceutical aid.

Identification

A. Dissolve 0.1 g in 1 ml of *water*, add 9 ml of 5.0 per cent w/v solution of *sodium chloride* and heat on a water-bath, the solution becomes turbid at a temperature between 70° and 85°.

B. Dissolve about 0.1 g in 10 ml of *ethanolic potassium hydroxide solution*, boil for about 3 minutes, and evaporate to dryness. Dissolve the residue with 5 ml of *water*, yielding a clear solution. Add a few drops of *glacial acetic acid*; a white precipitate is formed.

Tests

Congealing temperature (2.4.10). 16° to 26°.

Acid value (2.3.23). Not more than 2.0.

Hydroxyl value (2.3.27). 60 to 80.

Saponification value (2.3.37). 45 to 69.

Iodine value (2.3.28). Not more than 2.0.

Heavy metals (2.3.13). Weigh 2 g of the substance under examination in a crucible and add sufficient *sulphuric acid* to wet the substance, carefully ignite at a low temperature until thoroughly charred. Add to the carbonized mass 2 ml of *nitric acid* and 5 drops of *sulphuric acid*, and heat cautiously until white fumes no longer are evolved. Ignite, preferably in a muffle furnace, at 500° to 600°, until the carbon is completely burned off. Cool, add 4 ml of *dilute hydrochloric acid*, cover,

digest on a steam bath for 15 minutes, and slowly evaporate on a steam bath to dryness. Moisten the residue with 1 drop of *hydrochloric acid*, add 10 ml of hot *water*, and digest for 2 minutes. Add *dilute ammonium hydroxide* dropwise until the solution is just alkaline to litmus paper, dilute with *water* to 25 ml, and adjust with *dilute acetic acid* to a pH between 3.0 and 4.0, using short-range pH indicator paper as an external indicator. Filter if necessary, rinse the crucible and the filter with 10 ml of *water*, combine the filtrate and rinsing in a 50-ml Nessler cylinder, dilute with *water* to 40 ml, and mix.

To each of the cylinder containing the standard solution and the test solution , add 2 ml of *acetate buffer* pH 3.5, then add 1.2 ml of *thioacetamide- glycerine* base , dilute with *water* to 50 ml, mix, allow to stand for 2 minutes, and view downward over a white surface: the colour of the solution obtained from the test solution is not more intense than that of the solution obtained from the standard solution, produced by treating 2 ml of *lead standard solution* (1 ppm) in a similar manner .

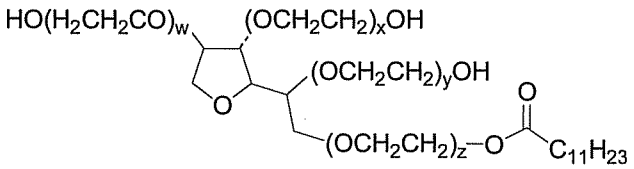
Sulphated ash (2.3.18). Not more than 0.3 per cent.

Water (2.3.43). Not more than 3.0 per cent, determined on 1 g.

Storage. Store protected from moisture.

Polysorbate 20

Polyoxyethylene 20 Sorbitan Monolaurate



w + x + y + z = 20

Polyoxyethylene 20 Sorbitan Monolaurate

Polysorbate 20 is a mixture of partial lauric esters of D-glucitol and its anhydrides copolymerised with approximately 20 moles of ethylene oxide for each mole of D-glucitol and its anhydrides. The lauric acid used for the esterification may contain other fatty acids.

Category. Pharmaceutical aid (non-ionic surfactant).

Description. A clear or slightly opalescent, oily, yellowish or brownish yellow liquid; odour, faint and characteristic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *polysorbate RS* or with the reference spectrum of polysorbate.

B. Dissolve 0.1 g in 5 ml of *chloroform*, add 0.1 g of *potassium thiocyanate* and 0.1 g of *cobalt nitrate* and stir with a glass rod; a blue colour is produced.

Tests

pH (2.4.24). 5.0 to 7.0, determined in a 5.0 per cent w/v solution in *carbon dioxide-free water*.

Acid value (2.3.23). Not more than 2.0, determined on 5.0 g.

Hydroxyl value (2.3.27). 96 to 108, determined on 2.0 g.

Saponification value (2.3.37). 40 to 50, using 15 ml of *0.5 M ethanolic potassium hydroxide* and diluting with 50 ml of *water* before carrying out the titration.

Iodine value (2.3.28). Not more than 5.0, determined by the iodine bromide method.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Reducing impurities. Dissolve 2.0 g in 25 ml of hot *water*, add 25 ml of *1 M sulphuric acid* and 0.1 ml of *ferroin solution* and titrate with *0.01 M ceric ammonium sulphate* shaking continuously until the colour changes from red to greenish blue persists for 30 seconds. Carry out a blank titration. Not more than 2.0 ml of *0.01 M ceric ammonium sulphate* is required.

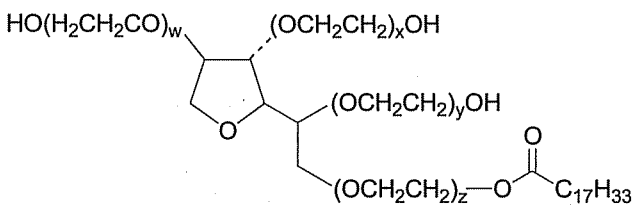
Sulphated ash. Not more than 0.2 per cent, determined by the following method. Weigh accurately about 2.0 g in a silica or platinum crucible, add 0.5 ml of *sulphuric acid* and heat on a water-bath for 2 hours. Carefully ignite at a low temperature until thoroughly charred. Add to the carbonised mass 2 ml of *nitric acid* and 0.25 ml of *sulphuric acid*, cautiously heat until white fumes are evolved and then ignite at 600° until the carbon is completely burnt off. Allow to cool, weigh and repeat the operation for periods of 15 minutes until two successive weighings do not differ by more than 0.5 mg.

Water (2.3.43). Not more than 3.0 per cent , determined on 1.0 g.

Storage. Store protected from light and moisture.

Polysorbate 80

Polyoxyethylene 80 Sorbitan Monooleate



w+x+y+z = 20

Polysorbate 80 is a mixture of partial oleic esters of D-glucitol and its anhydrides copolymerised with approximately 20 moles of ethylene oxide for each mole of D-glucitol and its anhydrides.

Category. Pharmaceutical aid (non-ionic surfactant).

Description. A clear or almost clear, oily, yellowish or brownish yellow liquid; odour, faint and characteristic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *polysorbate RS* or with the reference spectrum of polysorbate.

B. Dissolve 0.1 g in 5 ml of *chloroform*, add 0.1 g of *potassium thiocyanate* and 0.1 g of *cobalt nitrate* and stir with a glass rod; a blue colour is produced.

C. To 2 ml of a 5 per cent w/v solution add 0.5 ml of *bromine water*; the bromine is decolourised.

Tests

pH (2.4.24). 6.0 to 8.0, determined in a 5.0 per cent w/v solution in *carbon dioxide-free water*.

Acid value (2.3.23). Not more than 2.0, determined on 5 g.

Hydroxyl value (2.3.27). 65 to 80, determined on 2.0 g.

Saponification value (2.3.37). 45 to 55, using 15 ml of *0.5 M ethanolic potassium hydroxide* and diluting with 50 ml of *water* before carrying out the titration.

Iodine value (2.3.28). 18 to 24, determined by the iodine bromide method.

Reducing impurities. Dissolve 2.0 g in 25 ml of hot *water*, add 25 ml of *1 M sulphuric acid* and 0.1 ml of *ferroin solution* and titrate with *0.01 M ceric ammonium sulphate* shaking continuously until the colour changes from red to greenish blue persists for 30 seconds. Carry out a blank titration. Not more than 5.0 ml of *0.01 M ceric ammonium sulphate* is required.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash. Not more than 0.2 per cent, determined by the following method. Weigh accurately about 2.0 g in a silica or platinum crucible, add 0.5 ml of *sulphuric acid* and heat on a water-bath for 2 hours. Carefully ignite at a low temperature until thoroughly charred. Add to the carbonised mass 2 ml of *nitric acid* and 0.25 ml of *sulphuric acid*, cautiously heat until white fumes are evolved and then ignite at 600° until the carbon is completely burnt off. Allow to cool, weigh and repeat the operation for periods of 15 minutes until two successive weighings do not differ by more than 0.5 mg.

Water (2.3.43). Not more than 3.0 per cent, determined on 1.0 g.

Storage. Store protected from light and moisture.

Potassium Chloride

KCl Mol. Wt. 74.6

Potassium Chloride contains not less than 99.0 per cent and not more than 100.5 per cent of KCl, calculated on the dried basis.

Category. Electrolyte replenisher.

Dose. Prophylactic; 2 to 4 g (approximately 25 to 50 mmol) daily; therapeutic, in established potassium depletion, 10 to 15 g (approximately 135 to 200 mmol) daily.

Description. Colourless crystals or a white, crystalline powder; odourless.

Identification

Dissolve 10 g in 100 ml of *carbon dioxide-free water* prepared from *distilled water* (solution A). The solution gives the reactions of potassium salts and of chlorides (2.3.1).

Tests

Appearance of solution. Solution A is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. 5.0 g dissolved in 50 ml of *carbon dioxide-free water* requires not more than 0.5 ml of *0.01 M sodium hydroxide* or *0.01 M hydrochloric acid* for neutralisation to *bromothymol blue solution*.

Arsenic (2.3.10). Dissolve 10.0 g in 50 ml of *water* and add 10 ml of *stannated hydrochloric acid AsT*. The resulting solution complies with the limit test for arsenic (1 ppm).

Barium. To 5 ml of solution A add 5 ml of *water* and 1 ml of *1 M sulphuric acid*; the solution, after not less than 15 minutes, is not more opalescent than a mixture of 5 ml of solution A and 6 ml of *water*.

Heavy metals (2.3.13). Dissolve 2.0 g in 10 ml of *water* to which are added 2 ml of *dilute acetic acid* and 13 ml of *water*. The solution complies with the limit test for heavy metals, Method A (10 ppm).

Calcium and magnesium. Dissolve 1 g in 20 ml of *water*, add 1 ml of *dilute ammonia solution* and 1 ml of *sodium phosphate solution*; the solution remains clear.

Iron (2.3.14). 20 ml of solution A complies with the limit test for iron (20 ppm).

Bromides. Dilute 1.0 ml of solution A to 50.0 ml with *water*. To 5.0 ml of the solution add 2.0 ml of *phenol red reagent* and 1.0 ml of a 0.01 per cent solution of *chloramine T* and mix immediately. After exactly 2 minutes, add 0.15 ml of *0.1 M sodium thiosulphate*, mix and dilute to 10.0 ml with *water*. The absorbance of the solution measured at about 590 nm (2.4.7),

using *water* as the blank, is not more than that of a standard prepared at the same time and in the same manner, using 5.0 ml of a 0.0003 per cent w/v solution of *potassium bromide* (0.1 per cent).

Iodides. Moisten 5 g by adding dropwise, a solution freshly prepared by mixing 25 ml of *iodide-free starch solution*, 2 ml of *0.5 M sulphuric acid*, 0.15 ml of *sodium nitrite solution* and 25 ml of *water* and examine the mixture in daylight; the substance shows no blue colour after 5 minutes.

Sulphates (2.3.17). 0.5 g complies with the limit test for sulphates (300 ppm).

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.15 g, dissolve in 50 ml of *water* and titrate with *0.1 M silver nitrate* using *potassium chromate solution* as indicator.

1 ml of *0.1 M silver nitrate* is equivalent to 0.007455 g of KCl.

Potassium Chloride intended for use in the manufacture of dialysis solutions complies with the following additional requirement.

Aluminium. Dissolve 4.0 g in 100 ml of *water* and add 10 ml of *acetate buffer pH 6.0*. Extract with successive quantities of 20, 20 and 10 ml of a 0.5 per cent w/v solution of *8-hydroxyquinoline* in *chloroform* and dilute the combined extracts to 50 ml with *chloroform*. Use as the standard solution a mixture of 2 ml of *aluminium standard solution (2 ppm Al)*, 10 ml of *acetate buffer pH 6.0* and 98 ml of *water* treated in the same manner and as the blank solution a mixture of 10 ml of *acetate buffer pH 6.0* and 100 ml of *water* treated in the same manner. Measure the fluorescence of the test and standard solutions (2.4.5), using an excitation wavelength of about 392 nm and emission wavelength of about 518 nm and setting the instrument to zero with the blank solution in each case. The fluorescence of the test is not greater than that of the standard solution (1 ppm).

Potassium chloride intended for use in the manufacture of Parenteral Preparations or for the preparation of haemodialysis solution complies with the following additional requirement.

Sodium. Not more than 0.1 per cent, determined by atomic absorption spectrophotometry (2.4.2), using a 1.0 per cent w/v solution and measuring at 589 nm. Use *sodium solution AAS*, suitably diluted with *water*, for the standard solutions.

Storage. Store protected from moisture.

Labelling. The label states whether or not the material is suitable for use in the manufacture of Parenteral Preparations or for the preparation of haemodialysis or dialysis solutions.

Potassium Chloride and Dextrose Injection

Potassium Chloride in Dextrose Injection; Potassium Chloride and Dextrose Intravenous Infusion; Potassium Chloride and Glucose Intravenous Infusion

Potassium Chloride and Dextrose Injection is a sterile solution of Potassium Chloride and Dextrose in Water for Injections.

Potassium Chloride and Dextrose Injection contains not less than 95.0 per cent and not more than 110.0 per cent of the stated amount of potassium chloride, KCl, and not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of dextrose, $C_6H_{12}O_6$. It contains no antimicrobial agent.

Usual strengths: Injections containing the following amounts of potassium chloride, KCl, and dextrose, $C_6H_{12}O_6$.

per cent w/v of Potassium Chloride (KCl)	per cent w/v of Dextrose ($C_6H_{12}O_6$)
0.075	5
0.15	5
0.225	5
0.30	5

Description. A clear, colourless or faintly straw-coloured solution.

Identification

A. To 1 ml add 0.05 ml of *potassium cupri-tartrate solution*; the solution remains blue and clear. Heat to boiling, a copious red precipitate is formed.

B. Gives reaction B of potassium salts and reaction A of chlorides (2.3.1).

Tests

pH (2.4.24). 3.5 to 6.5.

5-Hydroxymethylfurfural and Related substances. Dilute a volume containing 1.0 g of Dextrose to 500.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 284 nm, absorbance at about 284 nm (2.4.7); not more than 0.25.

Heavy metals (2.3.13). Evaporate a volume containing 4.0 g of Dextrose to 10 ml and add 2 ml of *dilute acetic acid* and sufficient *water* to produce 25 ml. The solution complies with the limit test for heavy metals, Method A (5 ppm).

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. *For potassium chloride* — Titrate an accurately measured volume containing 0.1 g of Potassium Chloride with *0.1 M silver nitrate* using *potassium chromate solution* as indicator.

1 ml of *0.1 M silver nitrate* is equivalent to 0.007455 g of KCl.

For dextrose — To an accurately measured volume containing 2 g to 5 g of Dextrose, add 0.2 ml of *5 M ammonia* and sufficient *water* to produce 100.0 ml. Mix well, allow to stand for 30 minutes and measure the optical rotation in a 2-dm tube (2.4.22). The observed rotation in degrees multiplied by 0.9477 represents the weight, in g, of dextrose, $C_6H_{12}O_6$, in the volume taken for assay.

Storage. Store in single dose containers.

Labelling. The label states (1) the strength as the percentages w/v of Potassium Chloride and Dextrose; (2) the total osmolar concentration in mOsmol per litre; (3) where the contents are less than 100 ml, or where the label states that the Injection is not for direct use but is to be diluted before use, the label alternatively may state the total osmolar concentration in mOsmol per ml; (4) the content of potassium in millimoles; (5) that the injection containing visible particles in the solution should not be used.

Potassium Chloride, Sodium Chloride and Dextrose Injection

Potassium Chloride in Dextrose and Sodium Chloride Injection; Potassium Chloride, Sodium Chloride and Dextrose Intravenous Infusion; Potassium Chloride, Sodium Chloride and Glucose Intravenous Infusion

Potassium Chloride, Sodium Chloride and Dextrose Injection is a sterile solution of Potassium Chloride, Sodium Chloride and Dextrose in Water for Injections.

Potassium Chloride, Sodium Chloride and Dextrose Injection contains not less than 95.0 per cent and not more than 110.0 per cent of the stated amounts of sodium, Na, potassium, K, and chloride, Cl, and not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of dextrose, $C_6H_{12}O_6$. It contains no antimicrobial agent.

Usual strengths: Injections containing the following amounts of potassium chloride, KCl, sodium chloride, NaCl, and dextrose, $C_6H_{12}O_6$.

per cent w/v of Potassium Chloride (KCl)	*per cent w/v of Sodium Chloride (NaCl)*	*per cent w/v of Dextrose ($C_6H_{12}O_6$)*
0.075	0.250	5

0.300	0.225	5
0.300	0.330	5
0.300	0.450	5
0.300	0.900	5

Identification

A. To 1 ml add 0.05 ml of *potassium cupri-tartrate solution*; the solution remains blue and clear. Heat to boiling, a copious red precipitate is formed.

B. Gives reaction A of potassium salts, reaction B of sodium salts and reaction A of chlorides (2.3.1)

Tests

pH (2.4.24). 3.5 to 6.5, determined on a portion diluted with *water*, if necessary, to a concentration of not more than 5.0 per cent of dextrose.

5-Hydroxymethylfurfural and Related substances. Dilute a volume containing 1.0 g of Dextrose to 500.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 284 nm, absorbance at about 284 nm (2.4.7); not more than 0.25.

Heavy metals (2.3.13). Evaporate a volume containing 4.0 g of Dextrose to 10 ml and add 2 ml of *dilute acetic acid* and sufficient *water* to produce 25 ml. The solution complies with the limit test for heavy metals, Method A (5 ppm).

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. *For sodium* — Dilute appropriately with *water* and determine by Method A for flame photometry (2.4.4), or by

Method A for atomic absorption spectrophotometry (2.4.2), measuring at 589 nm and using *sodium solution FP* or *sodium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For potassium — Dilute appropriately with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 767 nm and using *potassium solution FP* or *potassium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For total chlorides — To 20.0 ml add 30 ml of *water*, 50.0 ml of *0.1 M silver nitrate* and 2 ml of *nitric acid*. Filter, wash the precipitate with *water* slightly acidified with *nitric acid* and titrate the excess of *silver nitrate* with *0.1 M ammonium thiocyanate* using *ferric ammonium sulphate solution* as indicator until a reddish yellow colour is produced. Carry out a blank titration.

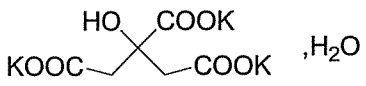
1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of total chloride, calculated as Cl.

For dextrose — To an accurately measured volume containing 2 g to 5 g of Dextrose, add 0.2 ml of *5 M ammonia* and sufficient *water* to produce 100.0 ml. Mix well, allow to stand for 30 minutes and measure the optical rotation in a 2-dm tube (2.4.22). The observed rotation in degrees multiplied by 0.9477 represents the weight, in g, of dextrose, $C_6H_{12}O_6$, in the volume taken for assay.

Storage. Store in single dose containers.

Labelling. The label states (1) the strength as the percentages w/v of Potassium Chloride, Sodium Chloride and Dextrose; (2) the total osmolar concentration in mOsmol per litre; (3) where the contents are less than 100 ml, or where the label states that the Injection is not for direct use but is to be diluted before use, the label alternatively may state the total osmolar concentration in mOsmol per ml; (4) the content of potassium, sodium and chloride in millimoles; (5) that the injection containing visible particles in the solution should not be used.

Potassium Citrate



$C_6H_5K_3O_7,H_2O$ Mol. Wt. 324.4

Potassium citrate is tripotassium 2-hydroxypropane-1,2,3-tricarboxylate monohydrate.

Potassium Citrate contains not less than 99.0 per cent and not more than 101.0 per cent of $C_6H_5K_3O_7$, calculated on the anhydrous basis.

Category. Systemic alkaliniser.

Dose. 4 to 10 g.

Description. White, granular crystals or a crystalline powder; odourless; hygroscopic.

Identification

A. Dissolve 10 g in 100 ml of *carbon dioxide-free water* prepared from *distilled water* (solution A). 0.5 ml of solution A gives the reactions of potassium salts (2.3.1).

B. To 1 ml of solution A add 4 ml of *water*; the solution gives the reactions of citrates (2.3.1).

Tests

Appearance of solution. Solution A is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. To 10 ml of solution A add 0.1 ml of *dilute phenolphthalein solution*; not more than 0.2 ml of *0.1 M hydrochloric acid* or *0.1 M sodium hydroxide* is required to change the colour of the solution.

Arsenic (2.3.10). Dissolve 5.0 g in 50 ml of *water* and add 15 ml of *stannated hydrochloric acid*. The resulting solution complies with the limit test for arsenic (2 ppm).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method A (10 ppm).

Sodium. Not more than 0.3 per cent, determined by atomic absorption spectrophotometry (2.4.2), Method II, measuring at 589 nm. Prepare the test solution by addition of 1 ml of *2 M hydrochloric acid* to 10.0 ml of solution A and diluting to 100.0 ml with *distilled water*. Use *sodium solution AAS*, suitably diluted with *distilled water*, for the standard solutions.

Chlorides (2.3.12). Dilute 25.0 ml of solution A to 35 ml with *water*. The resulting solution complies with the limit test for chlorides (100 ppm).

Oxalate. Dissolve 0.5 g in 4 ml of *water*, add 3 ml of *hydrochloric acid* and 1 g of *granulated zinc* and heat on a water-bath for 1 minute. Allow to stand for 2 minutes, decant into 0.25 ml of a 1 per cent w/v solution of *phenylhydrazine hydrochloride*, heat to boiling, cool rapidly, add an equal volume of *hydrochloric acid* and 0.25 ml of *potassium ferricyanide solution*, shake and allow to stand for 30 minutes. Any pink colour produced is not more intense than that obtained by treating 4.0 ml of a 0.005 per cent w/v solution of *oxalic acid* at the same time and in the same manner (300 ppm, calculated as anhydrous oxalic acid).

Sulphates (2.3.17). To 10.0 ml of solution A add 2 ml of *7 M hydrochloric acid* and dilute to 15 ml with *distilled water*; the solution complies with the limit test for sulphates (150 ppm).

Readily carbonisable substances. Heat 0.20 g, in powder, with 10 ml of *sulphuric acid (96 per cent w/w)* in a water-bath at 90° ± 1° for 60 minutes and cool rapidly. The solution is not more intensely coloured than reference solution YS2 or GYS2 (2.4.1).

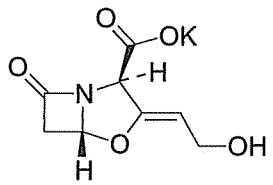
Water (2.3.43). 4.0 to 7.0 per cent, determined on 0.5 g, titration being done after stirring for 15 minutes subsequent to addition of the substance under examination.

Assay. Weigh accurately about 0.2 g, dissolve in 20 ml of *anhydrous glacial acetic* acid, heat to about 50°, allow to cool. Titrate with *0.1 M perchloric acid*, using 0.25 ml of *1-naphtholbenzein solution* as indicator and titrating until a green colour is obtained. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01021 g of $C_6H_5K_3O_7$.

Storage. Store protected from moisture.

Potassium Clavulanate



$C_8H_8KNO_5$ Mol. Wt. 237.3

Potassium Clavulanate is potassium (*Z*)-(2*R*,5*R*)-3-(2-hydroxyethylidene)-7-oxo-4-oxa-1-azabicyclo[3.2.0]heptane-2-carboxylate.

Potassium Clavulanate contains not less than 96.5 per cent and not more than 102.0 per cent of potassium clavulanate, $C_8H_8KNO_5$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white to off white, crystalline hygroscopic powder.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

B. Gives reaction A of potassium salts (2.3.1).

Tests

pH (2.4.24). 5.5 to 8.0, determined in 1.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Dissolve 0.25 g of the substance under examination in mobile phase A and dilute to 25 ml with mobile phase A.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with mobile phase A.

Reference solution (b). A solution containing 0.01 per cent w/v each of *lithium clavulanate RS* and *amoxycillin trihydrate RS* in mobile phase A.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature. 40°,
- mobile phase: A. a 0.78 per cent w/v solution of *sodium dihydrogen phosphate* adjusted to pH 4.0 with *phosphoric acid* and filtered through a 0.5 µm filter,
  B. a mixture of equal volumes of mobile phase A and *methanol*,
- a linear gradient programme using the conditions given below,
- flow rate. 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume. 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0 – 4	100	0
4 – 15	100 →50	0 50
15 – 18	50	50
18 – 24	50→100	50→ 0
24 – 39	100	0

Inject reference solution (b). The resolution between clavulanate (first peak) and amoxycillin (second peak) is not less than 13.

Inject the test solution and reference solution (b). The area of any individual impurity peak obtained is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). The sum of all impurity peaks obtained is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (2.0 per cent). Ignore any peaks with an area 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Water (2.3.43). Not more than 1.5 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

NOTE —Prepare the solutions immediately before use.

Test solution. Dissolve 50.0 mg of the substance under examination in a 0.41 per cent w/v solution of *sodium acetate* previously adjusted to pH 6.0 with *glacial acetic acid*, and dilute to 50.0 ml with the same solution.

Reference solution (a). A 0.1 per cent w/v solution of *lithium clavulanate RS* in a 0.41 per cent w/v solution of *sodium acetate* previously adjusted to pH 6.0 with *glacial acetic acid.*

Reference solution (b). A solution containing 0.1 per cent w/v each of *lithium clavulanate RS* and *amoxycillin trihydrate RS* in a 0.41 per cent w/v solution of *sodium acetate* previously adjusted to pH 6.0 with *glacial acetic acid.*

Chromatographic system
- a stainless steel column 30 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 5 volumes of *methanol* and 95 volumes of a 1.5 per cent w/v solution of *sodium dihydrogen phosphate* previously adjusted to pH 4.0 with *dilute phosphoric acid,*
- flow rate. 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume. 10 µl.

Inject reference solution (b). The resolution between clavulanate (first peak) and amoxycillin (second peak) is not less than 3.5.

Inject alternately the test solution and reference solution (a).

Calculate the content of $C_8H_8KNO_5$.

1 mg of clavulanate ($C_8H_9NO_5$) is equivalent to 1.191 mg of $C_8H_8KNO_5$.

Potassium Clavulanate intended for use in the manufacture of Parenteral Preparations without a further procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.03 Endotoxin Unit per mg of potassium clavulanate.

Potassium Clavulanate intended for use in the manufacture of Parenteral Preparations without a further sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from moisture.

Labelling. The label states whether it is intended for use in the manufacture of parenteral preparations.

Potassium Clavulanate Diluted

$C_8H_8KNO_5$ Mol. Wt. 237.3

Potassium Clavulanate Diluted is a dry mixture of Potassium Clavulanate and Microcrystalline Cellulose, or Silica, colloidal anhydrous or Silica, colloidal hydrated.

Potassium Clavulanate Diluted contains not less than 91.2 per cent and not more than 107.1 per cent of the stated amount of potassium clavulanate, $C_8H_8KNO_5$.

Category. Antibacterial.

Description. A white or almost white powder, hygroscopic.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

B. Gives reaction A of potassium salts (2.3.1).

C. Depending on the diluent used, carry out one of the relevant identification tests given below.

(i) On a watch-glass place a quantity of the substance under examination corresponding to 20 mg of cellulose and disperse in 4 ml of *iodinated zinc chloride solution.* The powder becomes violet-blue in colour.

(ii) It gives the reaction of silicates (2.3.1).

Tests

pH (2.4.24) 4.8 to 8.0, determined on a quantity of the substance under examination containing 0.2 g of potassium clavulanate dissolved in 20 ml of *carbon dioxide-free water.*

Light absorption. When examined in the range 230 nm to 360 nm (2.4.7), a 0.1 per cent w/v solution in *0.1 M phosphate buffer solution pH 7.0* shows an absorption maximum 0.40 measured immediately at 278 nm.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve a quantity of the substance under examination containing 0.25 g of potassium clavulanate in 5 ml of mobile phase A, dilute to 25.0 ml with mobile phase A and filter.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase A.

Reference solution (b). Dissolve 10 mg of *amoxycillin trihydrate RS* in 1 ml of the test solution and dilute to 100 ml with mobile phase A.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. a 0.78 per cent w/v solution of *sodium dihydrogen phosphate* with the pH adjusted to 4.0 with *dilute phosphoric acid,*

  B. a mixture of equal volumes of mobile phase A and *methanol,*

- flow rate. 1 ml per minute,
- a linear gradient programme using the conditions given below,
- spectrophotometer set at 230 nm,
- injection volume. 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)	Comment
0	100	0	Isocratic
4	100	0	begin linear gradient
15	50	50	
18	50	50	end chromatogram, return to 100A
24	100	0	end equilibration, begin next chromatogram

Inject reference solution (b). The resolution between the clavulanate (first peak) and amoxycillin (second peak) is not less than 13.

Inject alternatively the test solution and reference solution (a). Any individual impurity is not more than 1.0 per cent and the sum of all impurities found is not more than 2.0 per cent.

Water (2.3.43). Not more than 2.5 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve a quantity of the substance under examination containing about 50.0 mg of potassium clavulanate in a 0.4 per cent w/v solution of *sodium acetate* with the pH previously adjusted to 6.0 with *glacial acetic acid*, dilute to 50.0 ml with the same solution and filter.

Reference solution (a). Dissolve 50.0 mg of *lithium clavulanate RS* in a 0.4 per cent w/v solution of *sodium acetate* with the pH previously adjusted to 6.0 with *glacial acetic acid* and dilute to 50.0 ml with the same solution.

Reference solution (b). Dissolve 10 mg of *amoxycillin trihydrate RS* in 10 ml of reference solution (a).

Chromatographic system
- a stainless steel column 30 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 5 volumes of *methanol* and 95 volumes of a 1.5 per cent w/v solution of *sodium dihydrogen phosphate* with the pH previously adjusted to 4.0 with *dilute phosphoric acid*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume. 20 µl.

Inject reference solution (b). The resolution between the clavulanate peak and amoxycillin peak is not less than 3.5.

Inject alternately the test solution and reference solution (a).

Calculate the content of $C_8H_8KNO_5$.

1 mg of clavulanate ($C_8H_9NO_5$) is equivalent to 1.191 mg of $C_8H_8KNO_5$.

Storage. Store protected from moisture.

Labelling. The label states the percentage contents of potassium clavulanate and the diluent used to prepare the mixture.

Potassium Iodide

KI Mol. Wt. 166.0

Potassium Iodide contains not less than 99.0 per cent and not more than 100.5 per cent of KI, calculated on the dried basis.

Category. Antithyroid; antifungal; expectorant.

Dose. In preoperative treatment of thyrotoxicosis, 30 to 60 mg; as expectorant, 250 to 500 mg.

Description. Colourless crystals or a white powder; odourless.

Identification

Dissolve 10 g in 100 ml of *carbon dioxide-free water* (solution A). The solution gives the reactions of potassium salts, and of iodides (2.3.1).

Tests

Appearance of solution. Solution A is clear (2.4.1), and colourless (2.4.1).

Alkalinity. To 10 ml of solution A add 0.2 ml of *0.01 M sulphuric acid*; no colour is produced on addition of a drop of *phenolphthalein solution*.

Arsenic (2.3.10). Dissolve 5.0 g in 50 ml of *water* and 12 ml of *stannated hydrochloric acid AsT*. The resulting solution complies with the limit test for arsenic (2 ppm).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method A (10 ppm).

Iron (2.3.14). 20 ml of solution A complies with the limit test for iron (20 ppm).

Barium. Dissolve 0.5 g in 10 ml of *water* and add 1 ml of *dilute sulphuric acid*; no turbidity develops within one minute.

Cyanide. Warm 5 ml of Solution A, add one drop of *ferrous sulphate solution* and 0.5 ml of *sodium hydroxide solution*

and acidify with *hydrochloric acid*; no blue colour is produced.

Iodate. Dissolve 0.5 g in 10 ml of *carbon dioxide-free water* and add 0.15 ml of *dilute sulphuric acid* and a drop of *iodide-free starch solution*; no blue colour is produced within 2 minutes.

Sulphates (2.3.17). 1.0 g dissolved in 15 ml of *water* complies with the limit test for sulphates (150 ppm).

Thiosulphate. Dissolve 1 g in 10 ml of *water*, add 0.1 ml of *starch solution* and 0.1 ml of *0.005 M iodine*; a blue colour is produced.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g of the powdered substance by drying in an oven at 105° for 3 hours.

Assay. Weigh accurately about 0.35 g, dissolve in about 10 ml of *water*, add 35 ml of *hydrochloric acid* and 5 ml of *chloroform*. Titrate with *0.05 M potassium iodate* until the purple colour of iodine disappears from the chloroform. Add the last portion of the iodate solution dropwise and agitate vigorously and continuously. Allow to stand for 5 minutes. If any colour develops in the chloroform layer continue the titration until the chloroform is decolorised.

1 ml of *0.05 M potassium iodate* is equivalent to 0.0166 g of KI.

Storage. Store protected from light and moisture.

Potassium Permanganate

$KMnO_4$ Mol. Wt. 158.0

Potassium Permanganate contains not less than 99.0 per cent and not more than 100.5 per cent of $KMnO_4$.

Category. Antiseptic.

Description. A dark purple or brownish black, granular powder or dark purple or almost black slender, prismatic crystals, having a metallic lustre; odourless. It decomposes on contact with certain organic substances.

Identification

A. A solution in *water* acidified with *sulphuric acid* and heated to 70° is decolorised by *hydrogen peroxide solution (20 vol)*.

B. Heated to redness, it decrepitates, evolves oxygen and leaves a black residue which with *water* forms *potassium hydroxide solution*; the resulting solution when neutralised with *dilute hydrochloric acid* gives the reactions of potassium salts (2.3.1).

Tests

Appearance of solution. Dissolve 1.5 g in 50 ml of distilled *water*, heat on a water-bath and add gradually 6 ml of *ethanol (95 per cent)*, cool, dilute to 60 ml with distilled *water* and filter. The filtrate (solution A) is colourless (2.4.1).

Chlorides (2.3.12). 40 ml of solution A complies with the limit test for chlorides (250 ppm).

Sulphates (2.3.17). 10 ml of solution A complies with the limit test for sulphates (600 ppm).

Water-insoluble matter. Dissolve 0.5 g in 50 ml of *water*, heat to boiling, filter through a tared, sintered-glass filter (porosity No. 4) and wash with *water* until the filtrate is colourless. The weight of the residue, dried at 105° to constant weight, is not more than 5 mg (1.0 per cent).

Assay. Weigh accurately about 0.3 g, dissolve in sufficient *water* to produce 100.0 ml. To 20.0 ml add 20 ml of *water*, 1 g of *potassium iodide* and 10 ml of *2 M hydrochloric acid* and titrate the liberated iodine with *0.1 M sodium thiosulphate* using *starch solution*, added towards the end of the titration, as indicator.

1 ml of *0.1 M sodium thiosulphate* is equivalent to 0.003160 g of $KMnO_4$.

Storage. Store protected from moisture.

CAUTION — Great care should be taken in handling potassium permanganate as dangerous explosions are liable to occur if it is brought into contact with organic or other readily oxidisable substances, either in solution or in the dry condition.

Potassium Sorbate

$CH_3CH=CHCH=CHCOOK$

$C_6H_7KO_2$ Mol. Wt.150.2

Potassium Sorbate is potassium 2,4-hexadienoate.

Potassium Sorbate contains not less than 99.0 per cent and not more than 101.0 per cent of $C_6H_7KO_2$, calculated on the dried basis.

Category. Food preservativ.

Description. A white or almost white powder or granules.

Identification

Test A may be omitted if tests B and C are carried out. Test B may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *potassium*

sorbate RS or with the reference spectrum of potassium sorbate.

B. When examined in the range 230 nm to 350 nm (2.4.7), a 0.02 per cent w/v solution in *water*, dilute 1.0 ml of this solution to 100.0 ml with *0.1 M hydrochloric acid* shows an absorption maximum at about 264 nm and the specific absorbance at 264 nm is 1650 to 1900.

C. Dissolve 0.2 g in 2 ml of *water* and add 2 ml of *dilute acetic acid*, filter. The solution gives reaction B of potassium (2.3.1).

Tests

Appearance of solution. A 5 per cent w/v solution in *carbon dioxide-free water* (solution A) is clear (2.4.1) and not more intensely coloured than reference solution YS5 (2.4.1).

Acidity or alkalinity. To 20 ml of solution A, add 0.1 ml of *phenolphthalein solution*. Titrate with *0.1 M sodium hydroxide* or *0.1 M hydrochloric acid*. Not more than 0.25 ml is required to change the colour of the indicator.

Aldehydes. Not more than 0.15 per cent, determined by dissolving 1.0 g in a mixture of 50 ml of *2-propanol* and 30 ml of *water*, adjust to pH 4.0 with *1 M hydrochloric acid* and dilute to 100 ml with *water*. To 10 ml of the solution add 1 ml of *decolorised fuchsin solution* and allow to stand for 30 minutes. Any colour produced is not more intense than that obtained in a solution prepared simultaneously by adding by 1 ml of decolorised *fuchsin solution* to a mixture of 1.5 ml of *acetaldehyde standard solution (100 ppm C_2H_4O)*, 4 ml of *2-propanol* and 4.5 ml of *water*.

Heavy metals (2.3.13). Weigh in a silica crucible 2 g of the substance under examination, mix with 0.5 g of *magnesium oxide*. Ignite to dull redness until a homogeneous white or greyish-white mass is obtained. After 30 minutes of ignition if mixture remains coloured, allow to cool, mix using a fine glass rod and repeat the ignition. If necessary repeat the operation. Heat at 800° for about 1 hour. Dissolve the residue in 5 ml of a mixture of equal volumes of *hydrochloric acid* and *water*. Add 0.1 ml *of phenolphthalein solution* and then *concentrated ammonia* until a pink colour is obtained. Cool, add *glacial acetic acid* until the solution is decolourised and add 0.5 ml in excess. Filter if necessary and wash the filter. Dilute to 20 ml with *water*, 12 ml of the resulting solution complies with the limit test for heavy metals, Method D (10 ppm). Use lead standard solution (10 ppm pb) , diluting 1 ml standard solution to 10 ml with a mixture of equal volumes of *hydrochloric acid* and *water*.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

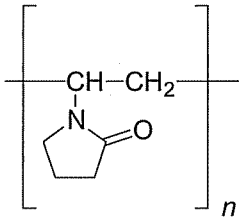
Assay. Weigh accurately about 0.12 g, dissolve in 20 ml of *anhydrous acetic acid*. Titrate with *0.1 M perchloric acid* using 0.1 ml of *crystal violet solution* as indicator until the colour changes from violet to bluish-green. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01502 g of $C_6H_7KO_2$.

Storage. Store protected from light.

Povidone

Polyvinylpyrrolidone; Polyvidone



$(C_6H_9NO)_n$ Mol. Wt. $(111.2)_n$

Povidone is poly(2-oxopyrrolidin-1-ylethylene) and consists of linear polymers of 1-vinylpyrrolidin-2-one. The different types of Povidone are characterised by their viscosity in solution, expressed as K-value, in the range 10 to 95.

Povidone with a nominal K-value of 15 or less has a K-value of not less than 85.0 per cent and not more than 115.0 per cent of the declared value. The K-value of povidone with a nominal K-value of more than 15, or a nominal K-value range with an average of more than 15, is not less than 90.0 per cent and not more than 107.0 per cent of the declared value or of the average of the declared range. It contains not less than 11.5 per cent and not more than 12.8 per cent of nitrogen, N, calculated on the anhydrous basis.

Category. Pharmaceutical aid (tablet binder, coating agent, dispersing and suspending agent).

Description. A white or yellowish white powder or flakes; odourless or almost odourless; hygroscopic.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *povidone RS*.

B. Add 2.5 g in small portions to a suitable volume of *carbon dioxide-free water*, stirring with a magnetic stirrer, and dilute to 25 ml with the same solvent (solution A). To 0.4 ml of solution A add 10 ml of *water*, 5 ml of *2 M hydrochloric acid* and 2 ml

of *potassium dichromate solution*; an orange-yellow precipitate is produced.

C. To 1 ml of solution A add 0.2 ml of *dimethylamino-benzaldehyde reagent* and 0.1 ml of *sulphuric acid*; a pink colour is produced.

D. To 0.1 ml of solution A add 5 ml of *water* and 0.2 ml of *0.05 M iodine*; a red colour is produced.

Tests

Appearance of solution. Solution A is clear (2.4.1), and not more intensely coloured than reference solution BS6 or BYS6 (2.4.1).

Heavy metals. Mix 2.0 g with 0.5 g of *magnesium oxide* in a silica crucible. Ignite to dull red heat until a homogeneous white or greyish white mass is produced. Heat at 800° for about 1 hour, dissolve the residue using two quantities, each of 5 ml, of *5 M hydrochloric acid*, add 0.1 ml of *phenolphthalein solution* and *strong ammonia solution* until a pink colour is produced. Cool, add *glacial acetic acid* until the solution is decolorised and add a further 0.5 ml. Filter if necessary and dilute the solution to 20 ml with *water*. To 12 ml of the resulting solution add 2 ml of *acetate buffer pH 3.5*, mix, add 1.2 ml of *thioacetamide reagent*, mix immediately and allow to stand for 2 minutes. Any brown colour produced is not more intense than that obtained by treating in the same manner a mixture of 2 ml of the test solution obtained above and 10 ml of the 20 ml of solution obtained by repeating the procedure using 2 ml of *lead standard solution (10 ppm Pb)* in place of the substance under examination, adding 0.5 g of *magnesium oxide* in a silica crucible and continuing as described above beginning at the words "Ignite to dull red heat...." (10 ppm).

Aldehydes. Boil 20.0 g in 180 ml of a 25 per cent v/v solution of *sulphuric acid* in a round-glass-stoppered flask under a reflux condenser for 45 minutes and allow to cool. Fit a distillation head, distil and collect 60 ml of the distillate in 20 ml of a 7.0 per cent w/v solution of *hydroxylamine hydrochloride*, previously adjusted to pH 3.1 using *1 M sodium hydroxide*, and cooled in ice. Titrate with *0.1 M sodium hydroxide* to pH 3.1. Carry out a blank titration. Not more than 9.1 ml of *0.1 M sodium hydroxide* is required (0.2 per cent, calculated as acetaldehyde, C_2H_4O).

1-vinylpyrrolidin-2-one. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 0.25 g of the substance under examination in 10.0 ml of the mobile phase.

Reference solution (a). A 0.05 per cent w/v solution of *1-vinylpyrrolidin-2-one* in *methanol.* Dilute 1.0 ml of this solution to 100.0 ml with *methanol.* Further dilute 5.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 10 mg of *1-vinylpyrrolidin-2-one* and 0.5 g of *vinyl acetate* in 100.0 ml of *methanol.* Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature. 40°,
- mobile phase: a mixture of 10 volumes of *acetonitrile* and 90 volumes of *water,*
- flow rate. 1 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume. 50 µl.

Inject reference solution (a) and (b). The test is not valid unless the resolution between the peaks due to 1-vinylpyrrolidin-2-one and vinyl acetate is not less than 2.0 in the chromatogram obtained with reference solution (b) and the relative standard deviation for replicate injections is not more than 2.0 in the chromatogram obtained with reference solution (a).

Inject the test solution and reference solution (a). In the chromatogram obtained with the test solution the area of the peak due to 1-vinylpyrrolidin-2-one is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 5.0 per cent determined on 0.5 g.

K-value. For Povidone with a stated K-value of 18 or less, prepare a 5.0 per cent w/v solution. For Povidone with a declared K-value of more than 18, prepare a 1.0 per cent w/v solution. Allow the solution to stand for 1 hour and carry out Method B for the determination of viscosity (2.4.28), at 25° ± 0.2° using a size no. 1 viscometer with a minimum flow time of 100 seconds. Calculate the K-value (K_o) from the expression

$$K_o = \frac{1.5\log z - 1}{0.15 + 0.003c} + \frac{\sqrt{300c\log z + (c + 1.5c\log z)^2}}{0.15c + 0.003c^2}$$

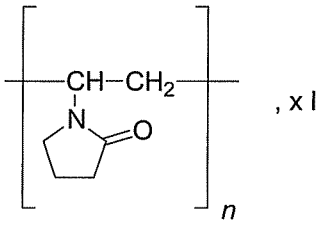
where c is the percentage concentration w/v of the substance under examination, calculated on the anhydrous basis, and z is the viscosity of the solution relative to that of *water*.

Nitrogen (2.3.30). Follow Method C, using 0.3 g, accurately weighed and 11 ml of *nitrogen-free sulphuric acid.* For complete destruction of organic matter repeat the addition of *hydrogen peroxide (10 vol)* (usually 3 to 6 times) until a clear, light-green solution is obtained, then heat for a further 4 hours.

Storage. Store protected from moisture.

Labelling. The label states the viscosity in terms of a K-value or K-range.

Povidone-Iodine



Povidone-Iodine is a complex produced by interaction between iodine and poly(2-oxopyrrolidin-1-ylethylene).

Povidone-Iodine contains not less than 9.0 per cent and not more than 12.0 per cent of available iodine, I, calculated on the dried basis.

Category. Topical anti-infective; antiseptic.

Description. A yellowish brown amorphous powder; odour, slight and characteristic of iodine.

Identification

A. Add 0.05 ml of a 10 per cent w/v solution to a mixture of 1 ml of *starch solution* and 9 ml of *water*; a deep blue colour is produced.

B. Spread 1 ml of a 10 per cent w/v solution over an area of about 20 cm x 20 cm on a glass plate and allow it to dry in air at room temperature and in an atmosphere of low humidity overnight; a brown, dry, non-smearing film is formed which dissolves readily in *water*.

Tests

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Nitrogen (2.3.30). 9.5 to 11.5 per cent, calculated on the dried basis, determined on about 0.3 g, by Method A.

Iodide. Not more than 6.6 per cent, calculated on the dried basis, determined by the following method. Weigh accurately about 0.5 g and dissolve in 100 ml of *water*. Add sufficient *sodium bisulphite solution* until the colour of iodine is discharged. Add 25.0 ml of *0.1 M silver nitrate* and 10 ml of *nitric acid* and mix. Titrate with *0.1 M ammonium thiocyanate*, using *ferric ammonium sulphate solution* as indicator. Repeat the procedure without the substance under examination. The difference between the titrations represents the amount of silver nitrate required. 1 ml of *0.1 M silver nitrate* is equivalent to 0.01269 g of I. From the percentage of total iodine, calculated on the dried basis, subtract the percentage of available iodine determined in the Assay and obtain the percentage of iodide.

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 8.0 per cent, determined on 0.5 g by drying in an oven at 105°.

Assay. Weigh accurately about 3 g, transfer to a beaker and add 200 ml of *water*. Cover the beaker and stir with a mechanical stirrer at room temperature for not more than 1 hour to dissolve as completely as possible. Titrate immediately thereafter with *0.1 M sodium thiosulphate* using 3 ml of *starch solution*, added towards the end of the titration, as indicator.

1 ml of *0.1 M sodium thiosulphate* is equivalent to 0.01269 g of I.

Storage. Store protected from light.

Povidone-Iodine Solution

Povidone-Iodine Solution is a solution of Povidone-Iodine in Purified Water. It may contain a small amount of Ethanol.

Povidone-Iodine Solution contains not less than 85.0 per cent and not more than 120.0 per cent of the stated amount of iodine, I.

Usual strengths. 5 per cent w/v; 7.5 per cent w/v; 10 per cent w/v.

Description. A deep brown liquid; odour, characteristic of iodine.

Identification

A. Dilute 1 ml to 20 ml with *water* and add 1 ml of the resulting solution to a mixture of 1 ml of *starch solution* and 9 ml of *water*; a deep blue colour is produced.

B. Transfer 10 ml to a small flask and cover the mouth of the flask with a filter paper soaked in *starch solution*; no blue colour is produced on the paper within 60 seconds.

C. Dilute 20 ml to 100 ml with *water*. To 10 ml add dropwise *0.1 M sodium thiosulphate* until the colour is just discharged. To 5 ml of the resulting solution add 5 ml of *2 M hydrochloric acid* and 2 ml of *potassium dichromate solution*; a red precipitate is produced.

Tests

pH (2.4.24). 3.0 to 6.5.

Ethanol (if present) (2.3.45). 90.0 to 110.0 per cent of the stated amount of C_2H_5OH, determined by Method A after decolorising the solution with just sufficient quantity of a 10 per cent w/v solution of *sodium thiosulphate* and treating with a few drops of *dilute sodium hydroxide solution*.

Assay. To an accurately measured volume containing about 50 mg of iodine add sufficient *water* to produce not less than 30 ml and titrate immediately with *0.02 M sodium thiosulphate*,

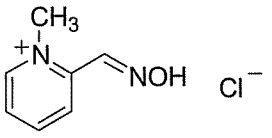
using 3 ml of *starch solution*, added towards the end of the titration, as indicator. Carry out a blank titration.

1 ml of *0.02 M sodium thiosulphate* is equivalent to 0.002538 g of I.

Storage. Store protected from light.

Labelling. The label states the quantities of iodine and ethanol (if present) as percentages w/v.

Pralidoxime Chloride



$C_7H_9ClN_2O$ Mol. Wt. 172.6

Pralidoxime Chloride is 2-hydroxyiminomethyl-1-methylpyridinium chloride.

Pralidoxime Chloride contains not less than 97.0 per cent and not more than 103.0 per cent of $C_7H_9ClN_2O$, calculated on the dried basis.

Category. Antidote for cholinesterase inhibitors.

Dose. By intravenous injection, 1 to 2 g as a 5 per cent w/v solution, administered over not less than 5 minutes period; by intramuscular injection, 1 g initially, followed by 1 to 2 further doses if necessary, upto a maximum of 12 g in 24 hours.

Description. A white to pale yellow, crystalline powder; odourless.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pralidoxime chloride RS* or with the reference spectrum of pralidoxime chloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.0005 per cent w/v solution in *0.1 M hydrochloric acid* shows absorption maxima at about 242 nm and 292 nm and in *0.1 M sodium hydroxide*, a maximum at about 332 nm.

C. To 0.1 ml of a 20 per cent w/v solution add 1 ml of a 0.6 per cent w/v solution of *ferric chloride*; an amber-brown colour is produced.

D. Gives the reactions of chlorides (2.3.1).

Tests

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method A (20 ppm).

Chloride content. 20.2 to 20.8 per cent, calculated on the dried basis, determined by the following method. Weigh accurately about 0.3 g, dissolve in about 150 ml of *water*, add 20 ml of *glacial acetic acid* and 10 drops of *(4-tert-octylphenoxy) nonaethoxyethanol* and titrate with *0.1 M silver nitrate*, determining the end-point potentiometrically (2.4.25).

1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of Cl.

Sulphated ash (2.3.18). Not more than 0.5 per cent.

Loss on drying (2.4.19). Not more than 2.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Weigh accurately about 0.5 g, dissolve in sufficient *water* to produce 250.0 ml and mix. Dilute 5.0 ml of this solution to 100.0 ml with *water*. Transfer 5.0 ml to a 50-ml volumetric flask, dilute to about 40 ml with *water*, add 5.0 ml of *1 M sodium hydroxide* and dilute to volume with *water*. Within 10 minutes of the addition of the alkali, measure the absorbance of the solution at the maximum at about 332 nm (2.4.7), using a solution of 5.0 ml of *1 M sodium hydroxide* diluted with *water* to 50.0 ml as the blank.

Calculate the content of $C_7H_9ClN_2O$ from the absorbance obtained by carrying out the assay simultaneously using about 0.5 g, accurately weighed, of *pralidoxime chloride RS*.

Storage. Store protected from moisture.

Pralidoxime Chloride Injection

Pralidoxime Chloride Injection is a sterile material consisting of Pralidoxime Chloride with or without buffering agents and other excipients. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Pralidoxime Chloride Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of pralidoxime chloride, $C_7H_9ClN_2O$.

Usual strength. 1 g.

Description. A white to pale yellow powder.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pralidoxime chloride RS* or with the reference spectrum of pralidoxime chloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.0005 per cent w/v solution in *0.1 M hydrochloric acid* shows absorption maxima at about 242 nm and 292 nm and in *0.1 M sodium hydroxide*, a maximum at about 332 nm.

C. To 0.1 ml of a 20 per cent w/v solution add 1 ml of a 0.6 per cent w/v solution of *ferric chloride*; an amber-brown colour is produced.

D. Gives the reactions of chlorides (2.3.1).

Tests

pH (2.4.24). 3.5 to 4.5, determined in a 5.0 per cent w/v solution.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method A (20 ppm).

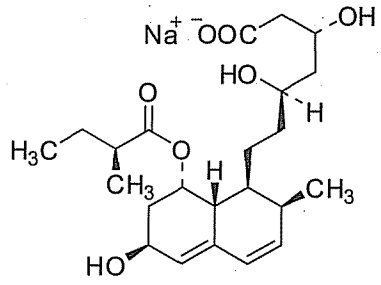
Bacterial endotoxins (2.2.3). Not more than 0.1 Endotoxin Unit per mg of pralidoxime chloride.

Assay. Weigh accurately about 0.5 g, dissolve in sufficient *water* to produce 250.0 ml and mix. Dilute 5.0 ml of this solution to 100.0 ml with *water*. Transfer 5.0 ml to a 50-ml volumetric flask, dilute to about 40 ml with *water*, add 5.0 ml of *1 M sodium hydroxide* and dilute to volume with *water*. Within 10 minutes of the addition of the alkali, measure the absorbance of the solution at the maximum at about 332 nm (2.4.7), using a solution of 5.0 ml of *1 M sodium hydroxide* diluted with *water* to 50.0 ml as the blank.

Calculate the content of $C_7H_9ClN_2O$ from the absorbance obtained by carrying out the assay simultaneously using about 0.5 g, accurately weighed, of *pralidoxime chloride RS*.

Labelling. The label states the period within which the constituted injection should be used.

Pravastatin Sodium



$C_{23}H_{35}NaO_7$ Mol. Wt. 446.5

Pravastatin Sodium is sodium (3*R*,5*R*)-3,5-dihydroxy-7-[(1*S*,2*S*,6*S*,8*S*,8a*R*)-6-hydroxy-2-methyl-8-[[(2*S*)-2-methylbutanoyl]oxy]-1,2,6,7,8,8a-hexahydronaphthalen-1-yl]heptanoate

Pravastatin Sodium contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{23}H_{35}NaO_7$, calculated on the anhydrous and ethanol free basis.

Category. Antihyperlipidaemic.

Description. A white to yellowish white powder or crystalline powder, hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pravastatin sodium RS* or with the reference spectrum of pravastatin sodium.

B. 1 ml of a 5 per cent w/v solution in *carbon dioxide-free water* (Solution A) gives reaction A of sodium (2.3.1).

Tests

Appearance of solution. Dilute 2.0 ml of solution A to 10 ml with *water*. The solution is clear (2.4.1) and not more intensely coloured than the reference solution BYS6 (2.4.1).

pH (2.4.24). 7.2 to 9.0, determined in solution A.

Specific optical rotation (2.4.22). +153° to +159 °, determined in a 0.5 per cent w/v solution in *water*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 9 volumes of *methanol* and 11 volumes of *water*.

Test solution (a). Dissolve 100 mg of the substance under examination in 100 ml of the solvent mixture.

Test solution (b). Dilute 10 ml of test solution (a) to 100 ml with the solvent mixture.

Reference solution (a). Dissolve the contents of a vial of *pravastatin impurity A RS* in 1 ml of test solution (b).

Reference solution (b). Dilute 2 ml of test solution (a) to 100 ml with the solvent mixture. Dilute 1 ml of this solution to 10 ml with the solvent mixture.

Reference solution (c). Dissolve 12.4 mg of *pravastatin 1,1,3,3- tetramethylbutylamine RS* in 100 ml of the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),

- mobile phase: a mixture of 1 volume of *glacial acetic acid,* 1 volume of *triethylamine,* 450 volumes of *methanol* and 550 volumes of *water,*
- flow rate. 1.3 ml per minute,
- spectrophotometer set at 238 nm,
- injection volume. 10 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to pravastatin impurity A and pravastatin is not less than 7.0.

The relative retention times with reference to pravastatin for (3*R*,5*R*)-3,5-dihydroxy-7-[(1*S*,2*S*,6*S*,8*S*,8a*R*)-6-hydroxy-8-[[(2*S*,3*R*)-3-hydroxy-2-methylbutanoyl]oxy]-2-methyl-1,2,6,7,8,8a-hexahydronaphthalen-1-yl] heptanoic acid (3″-hydroxypravastatin) (pravastatin impurity B), (3*R*,5*R*)-3,5-dihydroxy-7-[(1S,2S,6S,8S,8a*R*)-6-hydroxy-8-[[(2S,3S)-3-hydroxy-2-methylbutanoyl]oxy]-2-methyl-1,2,6,7,8,8a-hexahydronapthalen-1-yl] heptanoic acid (3″-(*S*)-hydroxypravastatin) (pravastatin impurity E), (3*R*,5*R*)-3,5-dihydroxy-7-[(1*S*,2*S*,6*R*,8*S*,8a*R*)-6-hydroxy-2-methyl-8-[[(2*S*)-2-methylbutanoyl]oxy]-1,2,6,7,8,8a-hexahydronaphthalen-1-yl]heptanoic acid (6'-epipravastatin) (pravastatin impurity A), (1*S*,3*S*,7*S*,8*S*,8a*R*)-3-hydroxy-8-[2-[(2*R*,4*R*)-4-hydroxy-6-oxotetrahydro-2*H*-pyran-2-yl]ethyl]-7-methyl-1,2,3,7,8,8a-hexahydronaphthalen-1-yl (2*S*)-2-methylbutanoate (pravastatin lactone) (pravastatin impurity D) and (3*R*,5*R*) -3,5-dihydroxy-7-[(1*S*,2*S*,6*S*,8*S*,8a*R*)-6-hydroxy-2-methyl-8-[[(2*S*)-2-methylpentanoyl]oxy]-1,2,6,7,8,8a-hexahydronaphthalen-1-yl] heptanoic acid) (pravastatin impurity C) and (3*R*, 5*R*)-7-[(1*S*,2*S*,6*S*,8*S*,8a*R*)-6,8-dihydroxy-2-methyl-1,2,6,7,8,8a-hexahydronaphthalen-1-yl]-3,5-dihydroxyheptanoic acid (pravastatin impurity F) are about 0.2, 0.3, 0.6, 1.9 and 2.1 respectively.

Inject test solution (a) and reference solution (b). Run the chromatogram 2.5 times the retention time of the principal peak of pravastatin. In the chromatogram obtained with test solution (a), the area of peak due to pravastatin impurity A is not more than 1.5 times the area of the principal peak obtained with reference solution (b) (0.3 per cent), the area of peaks due to pravastatin impurities B, C, D and E is not more than the area of the principal peak obtained with reference solution (b) (0.2 per cent), the area of peak due to pravastatin impurity F is not more than 0.75 times the area of the principal peak obtained with reference solution (b) (0.15 per cent) the area of other secondary peak is not more than 0.5 times the area of the principal peak obtained with reference solution (b) (0.1 per cent) and sum of the areas of all the secondary peaks is not more than 3 times the area of the principal peak obtained with reference solution (b) (0.6 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). Dissolve 2.0 g in a mixture of 15 volumes of *water* and 85 volumes of *methanol* and dilute to 20 ml with the same solvent mixture and use 12 ml of the solution. The resulting solution complies with the limit test for heavy metals, Method B (20 ppm). Prepare the reference solution using *lead standard solution (2 ppm Pb)* obtained by diluting *lead standard solution (100 ppm Pb)* with a mixture of 15 volumes of *water* and 85 volumes of *methanol.*

Ethanol (2.3.45). Not more than 3.0 per cent v/v (determined by method I).

Water (2.3.43). Not more than 4.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14), as described in the test for Related substances with the following modification.

Inject the test solution (b) and reference solution (c).

Calculate the content of $C_{23}H_{35}NaO_7$ from the declared content of pravastatin in *pravastatin 1,1,3,3-tetramethylbutylamine RS.*

1 mg of pravastatin is equivalent to 1.052 mg of pravastatin sodium.

Storage. Store protected from light and moisture.

Pravastatin Tablets

Pravastatin Sodium Tablets

Pravastatin Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of pravastatin sodium, $C_{23}H_{35}NaO_7$.

Usual strengths. 10 mg; 20 mg; 40 mg.

Identification

A. Shake a quantity of the powdered tablets containing about 10 mg of Pravastatin Sodium with 80 ml of *water* for 10 minutes, dilute to 100 ml with *water*, filter. Dilute 1 ml to 10 ml with *water*. When examined in the range 220 to 350 nm (2.4.7), exhibits a maximum only at 238 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solution A. Dissolve 4.1 g of *anhydrous sodium acetate* in 400 ml of *water*, adjust the pH to 5.6 with *glacial acetic acid* and add sufficient *water* to produce 500 ml.

Solution B. Mix 20 volumes of *methanol* with 80 volumes of solution A.

Test solution. Add 20 ml of solution A to a quantity of the powdered tablets containing about 10 mg of Pravastatin Sodium, mix using a vortex mixer and then with the aid of ultrasound for 15 minutes, centrifuge. Dilute 1 ml of the clear supernatant liquid to 5 ml with solution B.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with solution B.

Reference solution (b). Dilute 1 ml of reference solution (a) to 5 ml with solution B.

Reference solution (c). Dilute 1 ml of reference solution (b) to 4 ml with solution B.

Reference solution (d). Dissolve 2 mg of *(3R,5R)-3,5-dihydroxy-7-[(1S,2S,6R,8S,8aR)-6-hydroxy-2-methyl-8-[[(2S)-2-methylbutanoyl]oxy]-1,2,6,7,8,8a-hexahydronaphthalen-1-yl]heptanoic acid RS (pravastatin impurity A RS)* in the minimum volume of *methanol* and dilute to 20 ml with the test solution.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (such as Ultrasphere ODS),
- mobile phase: a mixture of 1 volume of *glacial acetic acid* , 1 volume of *triethylamine*, 450 volumes of *methanol* and 550 volumes of *water*,
- flow rate.1.3 ml per minute,
- spectrophotometer set at 238 nm,
- injection volume. 20 µl.

Inject reference solution (d). The test is not valid unless the resolution between the peaks due to pravastatin impurity A and pravastatin is not less than 7.0.

Inject the test solution, reference solution (a), (b) and (c). In the chromatogram obtained with the test solution the area of any secondary peak is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (2 per cent), the area of one such peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent), not more than a further one such peak has an area more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than three times the area of the principal peak in the chromatogram obtained with reference solution (a) (3 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Add 20 ml of solution A to a quantity of the powdered tablets containing about 10 mg of Pravastatin Sodium, mix using a vortex mixer and then with the aid of ultrasound for 15 minutes, centrifuge. Dilute 1 ml of the clear supernatant liquid to 5 ml with solution B.

Reference solution (a). Dissolve 12.4 mg of *pravastatin 1,1,3,3,-tetramethylbutylamine RS* in 20 ml of solution A. Dilute 1 ml of this solution to 5 ml with solution B.

Reference solution (b). Dissolve 2 mg of *pravastatin impurity A RS* in the minimum volume of *methanol* and dilute to 20 ml with the test solution.

Use the chromatographic system, solution A and B as described under Related substances.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to pravastatin impurity A and pravastatin is not less than 7.0.

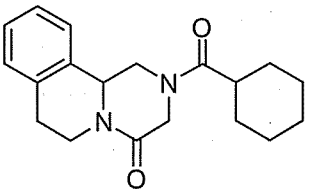
Inject the test solution and reference solution (a).

Calculate the content of $C_{23}H_{35}NaO_7$ in the tablets using the declared content of pravastatin in *pravastatin 1,1,3,3-tetramethylbutylamine RS*.

1 mg of $C_{23}H_{36}O_7$ is equivalent to 1.052 mg of $C_{23}H_{35}NaO_7$.

Storage. Store protected from light and moisture.

Praziquantel



$C_{19}H_{24}N_2O_2$ Mol.Wt. 312.4

Praziquantel is (11b*RS*)-2-(cyclohexylcarbonyl)-1,2,3,6,7,11b-hexahydro-4*H*-pyrazino[2,1-*a*]isoquinolin-4-one.

Praziquantel contains not less than 97.5 per cent and not more than 102.0 per cent of $C_{19}H_{24}N_2O_2$, calculated on the dried basis.

Category. Antihelminthic.

Description. A white or almost white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *praziquantel RS* or with the reference spectrum of praziquantel.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution (a). Dissolve 40 mg of the substance under examination in 10 ml of the mobile phase.

Test solution (b). Dilute 1.0 ml of test solution (a) to 20 ml with the mobile phase.

Reference solution (a). Dissolve 40 mg of *praziquantel RS* in 10 ml of the mobile phase. Dilute 1.0 ml to 20 ml with the mobile phase.

Reference solution (b). Dissolve 5.0 mg of *(11bRS)-2-benzoyl-1,2,3,6,7,11b-hexahydro-4H-pyrazino[2,1-a]isoquinolin-4-one RS (praziquantel impurity A RS)* in 25 ml of reference solution (a). Dilute 2.0 ml of this solution to 20 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of test solution (a) to 20 ml with the mobile phase. Dilute 5.0 ml of this solution to 50 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 45 volumes of *acetonitrile* and 55 volumes of *water*,
- flow rate.1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume. 20 µl.

Inject reference solutions (b). The test is not valid unless the resolution between the peaks corresponding to praziquantel impurity A and praziquantel is not less than 3.0.

Inject test solution (a), reference solution (b) and (c). Run the chromatogram 5 times the retention time of the principal peak. In the chromatogram obtained with test solution (a), the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent). The area of one such peak is not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent). The sum of the areas of all other secondary peaks is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 50° over *diphosphorus pentoxide* at a pressure not exceeding 0.7 kPa for 2 hours.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances.

Inject reference solution (b). The test is not valid unless the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the test solution (b) and reference solution (a).

Calculate the content of $C_{19}H_{24}N_2O_2$.

Storage. Store protected from light.

Praziquantel Tablets

Praziquantel Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of Praziquantel, $C_{19}H_{24}N_2O_2$.

Usual strength. 600 mg.

Identificaton

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *praziquantel RS* or with the reference spectrum of praziquantel.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gelG*.

Mobile phase. Ethyl acetate.

Test solution. Shake a quantity of the powdered tablets containing 30 mg of praziquantel in 5 ml of *methanol* for 5 minutes, centrifuge and use the clear supernatant liquid.

Reference solution. A 0.6 per cent w/v solution of *praziquantel RS* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine under ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No.1,
Medium. 900 ml of *0.1 M hydrochloric acid* containing 2.0 mg per ml of *sodium lauryl sulphate*,
Speed and time. 50 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate at the maximum at about 263 nm (2.4.7). Calculate the content of $C_{19}H_{24}N_2O_2$ in the medium from the absorbance obtained from a solution of known concentration of *praziquantel RS* in the same medium.

D. Not less than 75 per cent of the stated amount of $C_{19}H_{24}N_2O_2$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing 150 mg of Praziquantel, add 70 ml of mobile phase, sonicate for 5 minutes, dilute with mobile phase to 100 ml, mix and filter. Dilute 3.0 ml of the solution to 25 ml with the mobile phase and mix.

Reference solution. A 0.018 per cent w/v solution of *praziquentel RS* in the mobile phase.

Chromatographic System
- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase : a mixture of 60 volumes of *acetonitrile* and 40 volumes of *water,*
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume. 10 µl.

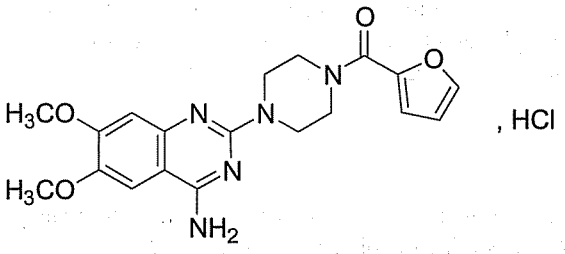
Inject the reference solution. The test is not valid unless the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 1.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{19}H_{24}N_2O_2$. in the tablets.

Storage. Store protected from light.

Prazosin Hydrochloride



$C_{19}H_{21}N_5O_4$, HCl Mol. Wt. 419.9

Prazosin Hydrochloride is 2-[4-(2-furoyl)piperazin-1-yl]-6,7-dimethoxyquinazolin-4-ylamine hydrochloride.

Prazosin Hydrochloride contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{19}H_{21}N_5O_4$, HCl, calculated on the anhydrous basis.

Category. Antihypertensive.

Dose. 500 µg to 1 mg two to three times daily.

Description. A white or almost white powder; odourless or almost odourless.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *prazosin hydrochloride RS.*

B. Prepare a 0.05 per cent w/v solution of the substance under examination in a 0.1 per cent v/v solution of *hydrochloric acid* in *methanol.* Dilute separately 1 ml and 5 ml of this solution to 100 ml with the same acid solution (solutions A and B respectively). When examined in the range 220 nm to 280 nm (2.4.7), solution A shows an absorption maximum at about 247 nm; absorbance at the maximum, 0.66 to 0.70. When examined in the range 280 nm to 400 nm, solution B exhibits two maxima at about 330 nm and 343 nm; absorbances at the two maxima, 0.65 to 0.70 and 0.60 to 0.66 respectively.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Solvent mixture. A mixture of 1 volume of *diethylamine,* 10 volumes of *methanol* and 10 volumes of *methylene chloride.*

Mobile phase. A mixture of 5 volumes of *diethylamine* and 95 volumes of *ethyl acetate.*

Test solution. Dissolve 10 mg of the substance under examination in 10 ml of solvent mixture.

Reference solution. A 0.1 per cent w/v solution of *prazosin hydrochloride RS* in solvent mixture.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 8 cm. Dry the plate in warm air and examine under ultra-violet light at 254 nm. The principal spot in the chroma togram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

D. A 0.1 per cent w/v solution gives the reactions of chlorides (2.3.1).

Tests

Iron. To 1.0 g add dropwise about 1.5 ml of *nitric acid,* heat cautiously on a water-bath until fumes are no longer evolved. Ignite by slowly raising the temperature from 150° to 1000°, maintaining the final temperature for 1 hour. Cool, dissolve the residue in 20 ml of *2 M hydrochloric acid,* evaporate to about 5 ml, dilute to 25 ml with *2 M hydrochloric acid* and examine the resulting solution by atomic absorption spectrophotometry (2.4.2), measuring at 248 nm using an iron hollow-cathode light as a source of radiation, an air-acetylene flame and *iron standard solution (8 ppm Fe),* diluted as

necessary with *water* to prepare the standard solutions (100 ppm).

Reserve about 10 ml of the solution for the Nickel test.

Nickel. Examine the final solution prepared in the test for Iron by atomic absorption spectrophotometry (2.4.2), measuring at 232 nm using a nickel hollow-cathode light as a source of radiation, an air-acetylene flame and using *nickel standard solution (10 ppm Ni)*, diluted as necessary with *water* to prepare the standard solutions (50 ppm).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50.0 mg of the substance under examination in the mobile phase and dilute to 50 ml with the mobile phase.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with the mobile phase. Further dilute 1 ml of the solution to 10 ml with the mobile phase.

Reference solution (b). Dissolve 8 mg of *metoclopramide hydrochloride RS* in 1 ml of the test solution and dilute to 25 ml with the mobile phase. Further dilute 1 ml of the solution to 10 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of *methanol* and 50 volumes of a solution containing 3.484 g per litre of *sodium pentanesulphonate* and 3.64 g per litre of *tetramethylammonium hydroxide* adjusted to pH 5.0 with *glacial acetic acid,*
- flow rate.1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Inject reference solution (b). The retention times are: prazocine about 9 minutes and metoclopramide about 5 minutes.The test is not valid unless the resolution between the peaks corresponding to prazocine and metoclopramide is at least 8.

Inject the test solution and reference solution (a). Continue the chromatography of the test solution for 6 times the retention time of the principal peak. Any secondary peak obtained with the test solution is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent).The sum of all the impurities is not more than five times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). Determine on the residue obtained in the test for Sulphated ash. Dissolve in sufficient *2 M nitric acid* to produce 50 ml. The resulting solution complies with the limit test for heavy metals, Method B (50 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Water (2.3.43). Not more than 0.5 per cent w/w, using 2.0 g dissolved in a mixture of equal volumes of *dichloromethane* and *methanol*.

Assay. Weigh accurately about 0.35 g, dissolve in 20 ml of *anhydrous formic acid* and 30 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, determining the end point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04199 g of $C_{19}H_{21}N_5O_4$, HCl.

Storage. Store protected from light.

Prazosin Tablets

Prazosin Hydrochloride Tablets

Prazosin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of prazosin, $C_{19}H_{21}N_5O_4$.

Usual strengths. The equivalent of 500 µg; 1 mg; 2 mg; 5 mg of prazosin.

Identification

Shake a quantity of the powdered tablets containing about 10 mg of prazosin with a mixture of 10 ml of *dichloromethane* and 10 ml of *0.05 M potassium hydroxide*, filter the organic layer through cotton, evaporate to dryness and dry the residue at 60° at a pressure not exceeding 2 kPa at 60° for 2 hours.

On the residue determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *prazosin hydrochloride RS* or with the reference spectrum of prazosin.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254.*

Mobile phase. A mixture of 95 volumes of *ethyl acetate* and 5 volumes of *diethylamine.*

Test solution. Shake a quantity of the powdered tablets containing 5 mg of prazosin with 2 ml of a mixture of 10 volumes of *dichloromethane*, 10 volumes of *methanol* and 1 volume of *diethylamine*, centrifuge and pass the supernatant liquid through a 0.5 µm PTFE (Polytetrafluoroethylene) filter.

Reference solution (a). Dilute 1 volume of test solution to 200 volumes with the same solvent mixture

Reference solution (b). Dilute 2 volumes of reference solution (a) to 5 volumes with the same solvent mixture.

Apply to the plate 20 µl of each solution. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than two such spots are more intense than the spot in the chromatogram obtained with reference solution (b).

Uniformity of content. Comply with the tests stated under Tablets.

Determine by liquid chromatography (2.4.14).

Test solution. Shake one tablet for 1 hour in a suitable volume of a mixture of 96 volumes of *methanol*, 2 volumes of *glacial acetic acid* and 2 volumes of *water* to produce a solution containing 0.002 per cent w/v solution of prazosin, centrifuge and use the supernatant liquid.

Reference solution. A 0.0022 per cent w/v solution of *prazosin hydrochloride RS* in the same solvent mixture.

Chromatographic system
- a stainless steel column 20 cm x 4 mm, packed with porous silica particles, (5 µm),
- mobile phase: 0.01 per cent w/v solution of *diethylamine* in a mixture of 96 volumes of *methanol*, 2 volumes of *glacial acetic acid* and 2 volumes of *water,*
- flow rate. 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Calculate the content of $C_{19}H_{21}N_5O_4$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Shake a quantity of the powdered tablets containing about 2 mg of prazosin with 100 ml in a mixture of 96 volumes of *methanol*, 2 volumes of *glacial acetic acid* and 2 volumes of *water* for 30 minutes, centrifuge and use the supernatant liquid.

Reference solution. A 0.0022 per cent w/v solution of *prazosin hydrochloride RS* in a mixture of 96 volumes of *methanol*, 2 volumes of *glacial acetic acid* and 2 volumes of *water.*

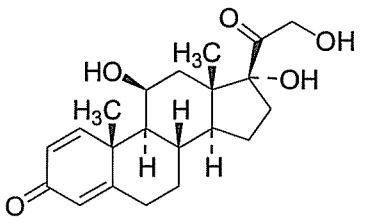
The chromatographic conditions as described under Uniformity of content may be used.

Calculate the content of $C_{19}H_{21}N_5O_4$ in the tablets.

Storage. Store protected from light.

Labelling. The label states the strength in terms of the equivalent amount of prazosin.

Prednisolone



$C_{21}H_{28}O_5$ Mol. Wt. 360.4

Prednisolone is 11*β*,17*α*,21-trihydroxypregna-1,4-diene-3,20-dione.

Prednisolone contains not less than 96.0 per cent and not more than 104.0 per cent of $C_{21}H_{28}O_5$, calculated on the dried basis.

Category. Adrenocortical steroid.

Dose. Upto 30 mg daily, in divided doses.

Description. A white or almost white, crystalline powder; hygroscopic.

Identification

Test A may be omitted if tests B and C are carried out. Test C may be omitted if tests A and B are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *prednisolone RS* or with the reference spectrum of prednisolone.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G.*

Solvent mixture. A mixture of 90 volumes of *acetone* and 10 volumes of *formamide.*

Mobile phase. Chloroform.

Test solution. Dissolve 25 mg of the substance under examination in 10 ml of the solvent mixture.

Reference solution (a). Dissolve 25 mg of *prednisolone RS* in 10 ml of the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow

the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot. A.

C. Dissolve 2 mg in 2 ml of *sulphuric acid* by shaking and allow to stand for 5 minutes; an intense red colour is produced with a reddish brown fluorescence when examined in ultraviolet light at 365 nm. Pour the solution into 10 ml of *water* and mix; the colour fades and there is a yellow fluorescence under ultra-violet light (365 nm).

Tests

Specific optical rotation (2.4.22). +96.0° to +102°, determined in a 1.0 per cent w/v solution in *dioxan*.

Light absorption (2.4.7). Absorbance of a 0.001 per cent w/v solution in *ethanol (95 per cent)* at the maximum at about 240 nm, 0.40 to 0.43.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 2 ml of *tetrahydrofuran* and dilute to 10ml with *water*.

Reference solution (a). Dissolve 2 mg of *prednisolone RS* and 2 mg of *hydrocortisone RS* in the mobile phase and dilute to 100 ml with the mobile phase.

Reference solution (b). Dilute 1 ml of the test solution to 100 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with base deactivated end-capped octadecylsilane bonded to porous silica (5 µm),
- column temperature. 45°,
- mobile phase: a mixture of 220 ml of *tetrahydrofuran* and 700 ml of *water*, allowed to equilibrate, diluted to 1000 ml with *water* and mixed again,
- flow rate. 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Equilibrate the column with the mobile phase for about 30 minutes.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with reference solution (b) is not less than 50 per cent of the full scale of the recorder.

Inject reference solution (a). The retention times are: prednisolone, about 14 minutes and hydrocortisone about 15.5 minutes. The test is not valid unless the resolution between the peaks corresponding to prednisolone and hydrocortisone is at least 2.2. If necessary, adjust the concentration of *tetrahydrofuran* in the mobile phase.

Inject separately the solvent mixture of the test solution as a blank, the test solution and reference solution (b). Continue the chromatography of the test solution for 4.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak other than the principal peak, is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and not more than one such peak has an area more than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all the peaks other than the principal peak is not more than 2.0 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2 per cent). Ignore any peak obtained with the blank run and any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with reference solution (b).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Weigh accurately about 0.1 g and dissolve in sufficient *ethanol* to produce 100.0 ml. Dilute 2.0 ml of this solution to 100.0 ml with *ethanol*. Measure the absorbance of the resulting solution at the maximum at about 243.5 nm. Calculate the content of $C_{21}H_{28}O_5$ taking 415 as the specific absorbance at 243.5 nm.

Storage. Store protected from light and moisture.

Prednisolone Tablets

Prednisolone Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of prednisolone, $C_{21}H_{28}O_5$.

Usual strengths. 5 mg; 10 mg; 20 mg.

Identification

Extract a quantity of the powdered tablets containing 30 mg of Prednisolone with 10 ml of *chloroform*, filter and evaporate the filtrate to dryness. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *prednisolone RS* or with the reference spectrum of prednisolone.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. A mixture of 90 volumes of *acetone* and 10 volumes of *formamide*.

Mobile phase. Chloroform.

Test solution. Dissolve 25 mg of the residue in 10 ml of the solvent mixture.

Reference solution (a). Dissolve 25 mg of *prednisolone RS* in 10 ml of the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the powdered tablets containing 10 mg of Prednisolone with 25 ml of *methanol* for 10 minutes and mix with the aid of ultrasound for 2 minutes; filter the extract (Whatman GF/F is suitable), wash the filter with two 10-ml quantities of *methanol*, combine the filtrate and washings and evaporate to dryness using a rotary evaporator and a warm water-bath, dissolve the residue in 10 ml of *tetrahydrofuran* and dilute to 20 ml with *water*.

Reference solution (a). Dissolve 2 mg of *prednisolone RS* and 2 mg of *hydrocortisone RS* in the mobile phase and dilute to 100 ml with the mobile phase.

Reference solution (b). Dilute 1 ml of the test solution to 100 ml with a 50 per cent v/v solution of *tetrahydrofuran*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature. 45°,
- mobile phase: a mixture of 220 ml of *tetrahydrofuran* and 700 ml of *water*, allowed to equilibrate, diluted to 1000 ml with *water* and mixed again,
- flow rate. 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Equilibrate the column with the mobile phase for about 30 minutes.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with reference solution (b) is not less than 50 per cent of the full scale of the recorder.

Inject reference solution (a). The retention times are: prednisolone, about 14 minutes and hydrocortisone about 15.5 minutes. The test is not valid unless the resolution between the peaks corresponding to prednisolone and hydrocortisone is not less than 2.2. If necessary, adjust the concentration of *tetrahydrofuran* in the mobile phase.

Inject separately the solvent mixture of the test solution as a blank, the test solution and reference solution (b). Continue the chromatography of the test solution for 4.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of the areas of all the peaks other than the principal peak is not greater than three times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent). Ignore any peak obtained with the blank run and any peak with an area less than 0.05 times that of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent) and any peak with a retention time of 3 minutes or less.

Uniformity of content. (*For tablets containing 10 mg or less*) — Comply with the test stated under Tablets.

Powder one tablet, add 50 ml of *ethanol (95 per cent)*, shake for 30 minutes, add sufficient *ethanol (95 per cent)* to produce 100.0 ml. Centrifuge and pipette a suitable volume of the supernatant liquid containing 0.5 mg of Prednisolone and dilute to 50.0 ml with *ethanol (95 per cent)*. Measure the absorbance of the resulting solution at the maximum at about 240 nm (2.4.7). Calculate the content of $C_{21}H_{28}O_5$ taking 415 specific absorbance at 240 nm.

Dissolution (2.5.2).

Apparatus. No. 1,

Medium. 900 ml of *water*,

Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium, filter and dilute a suitable volume of the filtrate with the same solvent. Measure the absorbance of the filtrate at the maximum at about 240 nm

(2.4.7). Calculate the content of $C_{21}H_{28}O_5$ in the medium from the absorbance obtained from a solution of known concentration of *prednisolone RS*.

D. Not less than 70 per cent of the stated amount of $C_{21}H_{28}O_5$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 5 mg of Prednisolone, add 58 ml of *methanol*, shake for 10 minutes and add sufficient *water* to produce 100.0 ml. Mix well and filter.

Reference solution (a). A solution containing 0.005 per cent w/v of *prednisolone RS* and 0.0075 per cent w/v of *dexamethasone* (internal standard) in a mixture of 58 volumes of *methanol* and 42 volumes of *water*.

Reference solution (b). Prepare in the same manner as the test solution but adding 10 ml of a 0.075 per cent w/v solution of *dexamethasone* in *methanol* and 48 ml of *methanol* in place of 58 ml of methanol.

Chromatographic system

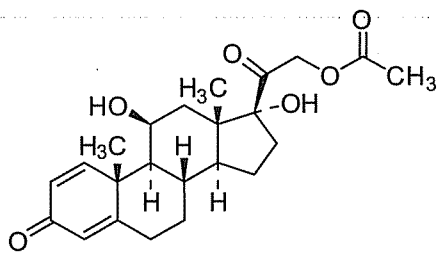
- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilyl silica gel (5 µm),
- mobile phase: a mixture of 42 volumes of *water* and 58 volumes of *methanol*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

The assay is not valid unless the resolution factor between the peaks due to prednisolone and dexamethasone is greater than 2.5 and the column efficiency, determined using the peak due to prednisolone in the chromatogram obtained with the test solution is greater than 15,000 theoretical plates per metre.

Calculate the content of $C_{21}H_{28}O_5$ in the tablets.

Storage. Store protected from light.

Prednisolone Acetate



$C_{23}H_{30}O_6$ Mol.Wt. 402.5

Prednisolone Acetate is 11β,17α-dihydroxy-3,20-dioxopregna-1,4-dien-21-yl acetate.

Prednisolone Acetate contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{23}H_{30}O_6$, calculated on the dried basis.

Category. Antiinflammtory; immunosuppressant.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *prednisolone acetate RS* or with the reference spectrum of prednisolone acetate.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel F254*.

Solvent mixture. 10 volumes of *methanol* and 90 volumes of *dichloromethane*.

Mobile phase. Add a mixture of 1.2 volumes of *water* and 8 volumes of *methanol* to a mixture of 15 volumes of *ether* and 77 volumes of *dichloromethane*.

Test solution. Dissolve 10 mg of the substance under examination in 10.0 ml of the solvent mixture.

Reference solution (a). A 0.1 per cent w/v solution of *prednisolone acetate RS* in the solvent mixture.

Reference solution (b). Dissolve 10 mg of *prednisolone pivalate RS* in 10.0 ml of reference solution (a).

Apply to the plate 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine in ultraviolet light at 254 nm. Spray with *alcoholic solution of sulphuric acid*. Heat at 105° for 10 minutes or until the spots appear. Allow to cool and examine under ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

C. Add about 2 mg of the substance under examination in 2 ml of *sulphuric acid* and shake to dissolve. Within 5 minutes, an intense red colour develops. When examined under ultraviolet light at 365 nm, a reddish-brown fluorescence is seen. Add the solution to 10 ml of *water* and mix. The colour fades and there is greenish-yellow fluorescence in ultraviolet light at 365 nm.

D. It gives the reaction of acetyl (2.3.1).

Tests

Specific optical rotation (2.4.22). +128° to +137°, determined in a 0.35 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use.

Solvent mixture. Equal volumes of *acetonitrile* and buffer solution pH 4 prepared by mixing 1 volume of *dilute hydrochloric acid*, 5 volumes of a 6.81 per cent w/v solution of *sodium acetate*, 15 volumes of a 3.73 per cent w/v solution of *potassium chloride* and 79 volumes of *water*.

Test solution. Dissolve 25 mg of the substance under examination in 10 ml of *methanol*.

Reference solution (a). Dissolve 2 mg each of *prednisolone acetate RS* and *hydrocortisone acetate RS (prednisolone impurity A RS)* in 100 ml of the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the test solution to 100 ml with the solvent mixture. Dilute 2.0 ml of this solution to 10 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- column temperature. 40°,
- mobile phase: a mixture of 35 volumes of *acetonitrile* and 65 volumes of *water*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

The relative retention time with reference to prednisolone acetate for prednisolone acetate impurity B is about 0.4, for prednisolone acetate impurity A is about 1.1, for prednisolone acetate impurity C is about 2.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to prednisolone acetate and prednisolone acetate impurity A is not less than 2.0.

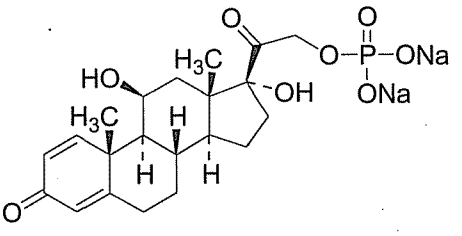
Inject the test solution and reference solution (b). Run the chromatogram 2.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of secondary peak corresponding to prednisolone acetate impurity A and B is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent), the area of secondary peak corresponding to prednisolone acetate impurity C is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). The area of any other secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent) and the sum of the areas of all secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent). Ignore any peak with an area less than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Dissolve 0.1 g in 100.0 ml of *ethanol (95 per cent)*. Dilute 2 ml of this solution to 100 ml with the same solvent. Measure the absorbance at the maximum at about 243 nm (2.4.7). Calculate the content of $C_{23}H_{30}O_6$ taking 370 as the specific absorbance at 243 nm.

Storage. Store protected from light.

Prednisolone Sodium Phosphate



$C_{21}H_{27}Na_2O_8P$ Mol. Wt. 484.4

Predisolone Sodium Phosphate is 11β,17α, 21-trihydroxypregna-1,4-diene-3,20-dione-21-(dihydrogenphosphate) disodium salt.

Prednisolone Sodium Phosphate contains not less than 96.0 per cent and not more than 102.0 per cent of $C_{21}H_{27}Na_2O_8P$, calculated on the dried basis.

Category. Antiinflammtory; immunosuppressant.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *prednisolone sodium phosphate RS*. If the spectra obtained in the solid state show differences, dissolve the substance under examination and the reference substance separately in the minimum volume of *ethanol (95 per cent)* evaporate to dryness on a water-bath and record the spectra again using the residues.

B. To about 40 mg add 2 ml of *sulphuric acid* and heat gently until white fumes are evolved. Add *nitric acid* dropwise, continue the heating until the solution is almost colourless and cool. Add 2 ml of *water*, heat until white fumes are again evolved, cool, add 10 ml of *water* and neutralise to *red litmus paper* with *dilute ammonia solution*. The solution complies with reaction A of sodium salts and reaction B of phosphates (2.3.1).

Tests

pH (2.4.24). 7.5 to 10.5 determined in 1.0 per cent w/v solution.

Specific optical rotation (2.4.22). +95.0° to +102.0°, determined in a 1.0 per cent w/v solution in a mixture of 9 volumes of *phosphate buffer pH 7.0* and 1 volume of *carbon dioxide-free water*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 62.5 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dissolve 25 mg of *prednisolone sodium phosphate RS* and 25 mg of *prednisolone RS* in the mobile phase and dilute to 25.0 ml with the same solvent. Dilute 1.0 ml of the solution to 25.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica or ceramic microparticles (5 µm),
- mobile phase: mix 1.36 g of *potassium dihydrogen phosphate* and 0.6 g of *hexylamine* and allow to stand for 10 minutes and dissolve in 185 ml of *water*, add 65 ml of *acetonitrile*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Inject reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with reference solution (b) is 70 per cent to 90 per cent of the full scale of the recorder.

Equilibrate the column with the mobile phase for about 30 minutes.

Inject reference solution (a). The retention times are: prednisolone sodium phosphate, about 6.5 minutes and prednisolone, about 8.5 minutes. The test is not valid unless the resolution between the peaks due to prednisolone sodium phosphate and prednisolone is at least 4.5; if this resolution is not achieved, increase the concentration of *acetonitrile* or increase the concentration of *water* in the mobile phase.

Inject separately the test solution and reference solution (b). Continue the chromatography for three times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak other than that from the principal peak is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (2 per cent) and not more than one such peak has an area greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent); the sum of the areas of all the peaks other than the principal peak is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3 per cent). Ignore any peak due to the solvent and any peak with an area less than 0.025 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Inorganic phosphate. Not more than 1.0 per cent of phosphate, PO_4.

Dissolve 50 mg in sufficient *water* to produce 100 ml. To 10 ml of the resulting solution add 5 ml of *molybdovanadic reagent*, mix and allow to stand for 5 minutes. Any yellow colour in the solution is not more intense than that produced in a standard prepared at the same time in the same manner using 10 ml of *phosphate standard solution (5 ppm PO_4)*.

Water (2.3.43). Not more than 6.5 per cent, determined on 1.0 g.

Assay. Weigh accurately about 0.1 g, dissolve in sufficient *water* to produce 100.0 ml and mix. Dilute 5.0 ml of the resulting solution to 250.0 ml with *water*. Measure the absorbance at the maximum at about 247 nm (2.4.7). Calculate the content of $C_{21}H_{27}Na_2O_8P$ taking 312 as the specific absorbance at 247 nm.

Storage. Store protected from light.

Prednisolone Sodium Phosphate Injection

Prednisolone Sodium Phosphate Injection is a sterile solution of Prednisolone Sodium Phosphate in Water for Injections.

Prednisolone Sodium Phosphate Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of prednisolone phosphate, $C_{21}H_{29}O_8P$.

Usual strength. 20 mg per ml.

Description. A clear, colourless liquid.

Identification

A. In the Assay, the chromatogram obtained with the test solution corresponds to the peak due to prednisolone sodium phosphate in the chromatogram obtained with reference solution (a).

B. To a volume containing 0.2 mg of Prednisolone Sodium Phosphate slowly add 1 ml of *sulphuric acid* and allow to stand for 2 minutes. A deep red colour is produced.

Tests

pH (2.4.24). 7.0 to 8.0.

Bacterial endotoxins (2.2.3). Not more than 5.0 Endotoxin Units per mg of prednisolone phosphate.

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute an accurately measured volume of the injection to obtain a solution containing 0.001 per cent w/v of prednisolone phosphate.

Reference solution (a). Weigh accurately about 10 mg of *prednisolone sodium phosphate RS*, dissolve in sufficient *water* to produce 100.0 ml (solution A) and dilute 10.0 ml of the solution to 100.0 ml with *water*.

Reference solution (b). Add 10 ml of a 0.01 per cent w/v solution of *betamethasone sodium phosphate RS* in *water* to 10 ml of solution A and dilute to 100 ml with *water*.

Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica or ceramic microparticles (10 µm) (such as Spherisorb ODS 1),
- mobile phase: a mixture of 45 volumes of *methanol* and 55 volumes of *citro-phosphate buffer pH 5.0*,
- flow rate. 2.0 ml per minute,
- spectrophotometer set at 247 nm,
- injection volume. 10 µl.

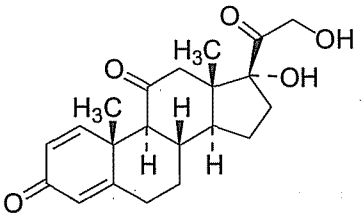
Inject reference solution (b). The test is not valid unless the resolution between the peaks due to betamethasone sodium phosphate and prednisolone sodium phosphate is at least 2.5.

Inject alternatively the test solution and reference solution (a).

Calculate the content of $C_{21}H_{29}O_8P$ in the injection.

Storage. Store protected from light, in a single-dose or in multi-dose containers.

Prednisone



$C_{21}H_{26}O_5$ Mol. Wt. 358.4

Prednisone is 17α,21-dihydroxypregna-1,4-diene-3,11,20-trione.

Prednisone contains not less than 96.0 per cent and not more than 104.0 per cent of $C_{21}H_{26}O_5$, calculated on the dried basis.

Category. Adrenocortical steroid.

Dose. 5 to 60 mg daily, in divided doses.

Description. A white or almost white, crystalline powder; odourless.

Identification

Tests A and B may be omitted if tests C and D are carried out. Tests C and D may be omitted if tests A and B are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *prednisone RS* or with the reference spectrum of prednisone.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. A mixture of 90 volumes of *acetone* and 10 volumes of *formamide*.

Mobile phase. Chloroform.

Test solution. Dissolve 25 mg of the substance under examination in 10 ml of the solvent mixture.

Reference solution (a). Dissolve 25 mg of *prednisone RS* in 10 ml of the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

C. Dissolve 2 mg in 2 ml of *sulphuric acid* and allow to stand for 5 minutes; an orange colour is produced within 5 minutes, which exhibits a blue fluorescence in ultraviolet light at 365 nm. Pour the solution into 10 ml of *water*; the colour changes first to yellow and then fades gradually but the blue fluorescence in ultraviolet light remains.

D. Dissolve 1 mg in 1 ml of *ethanol (95 per cent)*, evaporate to dryness at a pressure not exceeding 0.7 kPa, add 5 ml of *1 M*

sodium hydroxide and heat at 70° for 30 minutes; not more than a slight yellow colour is produced (distinction from cortisone acetate).

Tests

Specific optical rotation (2.4.22). +167° to +175°, determined in a 1.0 per cent w/v solution in *dioxan*.

Light absorption (2.4.7). Absorbance of a 0.001 per cent w/v solution in *methanol* at the maximum at about 240 nm, 0.40 to 0.43; the ratio of the absorbance at the maximum at about 240 nm to that at about 263 nm, 1.85 to 2.05.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in *methanol* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 2.0 mg of *prednisolone RS* and 2.0 mg of *prednisone RS* in methanol and dilute to 100 ml with the same solvent.

Reference solution (b). Dilute 1 ml of the test solution to 100 ml with *methanol*.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilyl silica gel (5 µm),
- column temperature. 45°,
- mobile phase: A. a mixture of 100 ml of *acetonitrile*, 200 ml of *methanol* and 650 ml of *water*, allowed to equilibrate, diluted to 1000 ml with *water* and mixed again,
  B. *acetonitrile*,
  –flow rate. 2.5 ml per minute,
- a linear gradient programme using the conditions given below,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Time (min)	Mobile Phase A (per cent v/v)	Mobile Phase B (per cent v/v)	Comment
0	100	0	Isocratic
25	100	0	begin linear gradient
40	40	60	end chromatogram, change to 100B
41	0	100	being treatment with B
46	0	100	end treatment, return to 100A
47	100	0	begin equilibration with A
52	100	0	end equilibration, begin next chromatogram

Equilibrate the column with the mobile phase B for at least 30 minutes and then with mobile phase A for 5 minutes. For subsequent chromatograms, use the conditions described from 40.0 to 52.0 minutes.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with reference solution (b) is not less than 50 per cent of the full scale of the recorder.

Inject reference solution (a). The retention times are: prednisone, about 19 minutes and prednisolone about 23 minutes. The test is not valid unless the resolution between the peaks corresponding to prednisone and prednisolone is at least 2.7. If necessary, adjust the concentration of acetonitrile in mobile phase A.

Inject separately *methanol* as a blank, the test solution and reference solution (b). In the chromatogram obtained with the test solution: the area of any peak other than the principal peak is not greater than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 0.75 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.75 per cent). Ignore any peak due to the blank run and any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Weigh accurately about 0.1 g and dissolve in sufficient *ethanol* to produce 100.0 ml. Dilute 2.0 ml of this solution to 100.0 ml with *ethanol*. Measure the absorbance of the resulting solution at the maximum at about 238 nm. Calculate the content of $C_{21}H_{26}O_5$ taking 425 as the specific absorbance at 238 nm.

Storage. Store protected from light.

Prednisone Tablets

Prednisone Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of prednisone, $C_{21}H_{26}O_5$.

Usual strengths. 5 mg; 10 mg.

Identification

Shake a quantity of the powdered tablets containing 30 mg of Prednisone with 10 ml of *chloroform*, filter and evaporate the

filtrate to dryness. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *prednisone RS* or with the reference spectrum of prednisone.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. A mixture of 90 volumes of *acetone* and 10 volumes of *formamide*.

Mobile phase. Chloroform.

Test solution. Dissolve 25 mg of the residue in 10 ml of the solvent mixture.

Reference solution (a). Dissolve 25 mg of *prednisone RS* in 10 ml of the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v).* Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the powdered tablets containing 25 mg of Prednisone with 10 ml of *methanol* for 10 minutes, mix with the aid of ultrasound for 2 minutes and filter the extract (Whatman GF/F is suitable).

Reference solution (a). Dissolve 2.0 mg of *prednisolone RS* and 2.0 mg of *prednisone RS* in *methanol* and dilute to 100 ml with the same solvent.

Reference solution (b). Dilute 1 ml of the test solution to 100 ml with *methanol.*

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica(5 µm),
- column temperature. 45°,
- mobile phase: A. a mixture of 100 ml of *acetonitrile*, 200 ml of *methanol* and 650 ml of *water*, allowed to equilibrate, diluted to 1000 ml with *water* and mixed again,
  B. *acetonitrile*,
- flow rate. 2.5 ml per minute,
- a linear gradient programme using the conditions given below,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Time (min)	Mobile Phase A (per cent v/v)	Mobile Phase B (per cent v/v)	Comment
0	100	0	Isocratic,
25	100	0	begin linear gradient
40	40	60	end chromatogram, change to 100B
41	0	100	begin treatment with B
46	0	100	end treatment, return to 100A
47	100	0	begin equilibration with A
52	100	0	end equilibration, begin next chromatogram

Equilibrate the column with the mobile phase B for at least 30 minutes and then with mobile phase A for 5 minutes. For subsequent chromatograms use the conditions described from 40.0 to 52.0 minutes.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with reference solution (b) is not less than 50 per cent of the full scale of the recorder.

Inject reference solution (a). The retention times are: prednisone, about 19 minutes and prednisolone about 23 minutes. The test is not valid unless the resolution between the peaks corresponding to prednisone and prednisolone is at least 2.7. If necessary, adjust the concentration of acetonitrile in mobile phase A.

Inject separately *methanol* as a blank, the test solution and reference solution (b). In the chromatogram obtained with the test solution: the area of any peak other than the principal

peak is not greater than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than 0.75 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.75 per cent). Ignore any peak due to the blank run and any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Uniformity of content. Comply with the test stated under Tablets.

Powder one tablet, add 50 ml of *ethanol (95 per cent)*, shake for 30 minutes, add sufficient *ethanol (95 per cent)* to produce 100.0 ml. Centrifuge and pipette a suitable volume of the supernatant liquid equivalent to 0.5 mg of Prednisone and dilute to 50.0 ml with *ethanol (95 per cent)*. Measure the absorbance of the resulting solution at the maximum at about 240 nm (2.4.7). Calculate the content of $C_{21}H_{26}O_5$ taking 415 as specific absorbance at 240 nm.

Dissolution (2.5.2).

Apparatus No. 1,
Medium. 900 ml of *water,*
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate at the maximum at about 240 nm (2.4.7). Calculate the content of $C_{21}H_{26}O_5$ in the medium from the absorbance obtained from a solution of known concentration of *prednisone RS*.

D. Not less than 70 per cent of the stated amount of $C_{21}H_{26}O_5$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Internal standard solution. Dissolve an accurately weighed quantity of *acetanilide* in a 50 per cent v/v solution of *methanol* to obtain a solution having a known concentration of 0.11 mg per ml.

Test solution. Weigh and powder 20 tablets. To an accurately weighed quantity of the powder containing about 20 mg of Prednisone, add 5 ml of *water*, mix with the aid of ultrasound for one minute, add 50 ml of *methanol* and mix with the aid of ultrasound for I minute. Dilute with *water* to 100.0 ml and mix. To 5.0 ml of this solution add 5.0 ml of internal standard solution and dilute to 50.0 ml with a 50 per cent v/v solution of *methanol* and mix. Filter through a 5 µm filter and discard the first 20 ml of the filtrate.

Reference solution. Weigh accurately a suitable quantity of *prednisone RS* and dissolve in a 50 per cent v/v solution of *methanol* to obtain a solution having a concentration of about 0.2 mg per ml. To 5.0 ml of this solution add 5.0 ml of internal standard solution and dilute to 50.0 ml with a 50 per cent v/v solution of *methanol*.

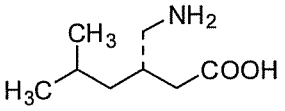
Chromatographic system
- a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica (3 to 10 µm),
- mobile phase: a suitable filtered mixture of 688 volumes of *water*, 250 volumes of *peroxide-free tetrahydrofuran* and 62 volumes of *methanol* such that at a flow rate of 1 ml per minute the retention times of prednisone and *acetanilide* are about 8 and 6 minutes respectively,
- spectrophotometer set at 254 nm,
- injection volume. 10 µl.

Inject the reference solution. Adjust the operating parameters such that the peak obtained is about 50 per cent of the full scale. The relative standard deviation for replicate injections is not more than 2.0 per cent and the resolution between prednisone and the internal standard is not less than 3.0.

Inject the test solution and the reference solution. Calculate the content of $C_{21}H_{26}O_5$ in the tablets.

Storage. Store protected from light.

Pregabalin



$C_8H_{17}NO_2$ Mol. Wt. 159.2

Pregabalin is (*S*)-4-amino-3-(2-methylpropyl)butyric acid.

Pregabalin contains not less than 98.0 per cent and not more than 102.0 per cent of $C_8H_{17}NO_2$, calculated on the dried basis.

Category. Anticonvulsant.

Description. A white to off-white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pregabalin RS* or with the reference spectrum of pregabalin.

Tests

Specific optical rotation (2.4.22). +10° to +12.0°, determined on 1.0 per cent w/v solution.

Enantiomeric purity. Determine by liquid chromatography (2.4.14).

Merfey's reagent. Dissolve about 0.1502 g of merfey's reagent in 50 ml of *acetone*.

NOTE—Store the reagent at 2° to 8°.

Test solution (a). Dissolve about 100 mg of the substance under examination in 100.0 ml of *water*.

Test solution (b). To 2.0 ml of test solution (a), add 0.5 ml of merfey's reagent and 0.5 ml of *1 M sodium bicarbonate* in the test tube. Heat at 40° for 60 minutes. Allow to equilibrate to room temperature.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil BDS C18),
- mobile phase: a mixture of 62 volumes of a buffer solution prepared by diluting about 7.18 ml of *triethylamine* to 1000 ml *water*, adjusted to pH 3.0 with *orthophosphoric acid* and 38 volumes of *acetonitrile*,
- flow rate. 2 ml per minute,
- spectrophotometer set at 340 nm,
- injection volume. 20 µl.

The retention time for S- Pregabalin is about 9 minutes and R-Pregabalin is about 12 minutes.

Inject test solution (b). The area of peak due to R-pregabalin is not more than 0.5 per cent the area of the S-pregabalin.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use.

Solvent mixture. 95 volumes of *water* and 5 volumes of *acetonitrile*.

Test solution. Dissolve about 50 mg of the substance under examination in 50.0 ml of the solvent mixture.

Reference solution. Dilute 5.0 ml of the test solution to 100 ml with the solvent mixture. Further dilute 5.0 ml of this solution to 50 ml with the solvent mixture.

Use chromatographic system as described under Assay.

Inject the reference solution. The test is not valid unless the relative standard deviation of replicate injections is not more than 5.0 per cent.

Inject the test solution and the reference solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of principal peak in the chromatogram obtained with reference solution (0.5 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (1.0 per cent).

Heavy Metals (2.3.13). 1 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 200 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution. A 0.2 per cent w/v solution of *pregabalin RS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS-3),
- mobile phase: a mixture of 95 volumes of *water* and 5 volumes of *acetonitrile,*
- flow rate. 1 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation of replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_8H_{17}NO_2$.

Storage. Store protected from light and moisture.

Pregabalin Capsules

Pregabalin Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of pregabalin, $C_8H_{17}NO_2$.

Usual strengths. 25 mg; 50 mg; 75 mg; 100 mg; 150 mg; 225 mg; 300 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1,
Medium. 900 ml of *0.05 M hydrochloric acid,*
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate and dilute, if necessary, with the dissolution medium.

Reference solution. A 0.0083 per cent w/v solution of *pregabalin RS* in the dissolution medium.

Use chromatographic system as described under Assay using injection volume 100 µl.

Inject the reference solution. The test is not valid unless the theoretical plates of the principal peak is not less than 2000, tailing factor is not more than 2.0 and the relative standard deviation of replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_8H_{17}NO_2$.

D. Not less than 70 per cent of the stated amount of $C_8H_{17}NO_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 1.2 g of *potassium dihydrogen phosphate* in 1000 ml of *water*, adjust the pH to 6.9 with *dilute potassium hydroxide*.

Test solution. Mix the content of 10 capsules. Weigh and disperse a quantity containing about 15 mg of Pregabalin, in about 25 ml of the solvent mixture, sonicate for 30 minutes and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). A 0.015 per cent w/v solution of *pregabalin RS* in the solvent mixture.

Reference solution (b). Dissolve 4.5 mg of *lactam RS* in 10.0 ml of the solvent mixture.

Reference solution (c). Dissolve 750 mg of *pregabalin RS* in 30 ml of solvent mixture. Add about 5 ml of reference solution (b) and dilute to 50.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS-3V),
- mobile phase: A. a mixture of 90 volumes of the solvent mixture and 10 volumes of *acetonitrile*,
  B. *acetonitrile*,
- a linear gradient programme using the conditions given below,
- flow rate. 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume. 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
5	100	0
25	35	65
30	100	0
40	100	0

Inject reference solution (a). The test is not valid unless the theoretical plates is not less than 3000, the tailing factor is not more than 2.0 and the relative standard deviation of replicate injections is not more than 2.0 per cent.

Inject reference solution (a) and the test solution. The relative retention time with reference to lactam peak for lactose conjugate impurity is about 0.78. In the chromatogram obtained with the test solution, the area of the peak due to lactam multiplied with relative response factor, 0.07 is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent), the area of lactose conjugate impurity peak multiplied with relative response factor, 0.05 is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (2.5 per cent). Ignore any peak with an area less than 0.05 times of the area of principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Mix the contents of 20 capsules. Disperse a quantity of powder containing about 200 mg of Pregabalin with 35 ml of the mobile phase, sonicate for 10 minutes and dilute to 50 ml with the mobile phase.

Reference solution. A 0.4 per cent w/v solution of *pregabalin RS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS-3),
- mobile phase: a mixture of 92 volumes of solution containing 2.72 g of *potassium dihydrogen orthophosphate* in 900 ml of *water*, add 2 ml of *triethylamine* and adjusted to pH 6.0 with *orthophosphoric acid*, 5 volumes of *methanol* and 3 volumes of *acetonitrile*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the theoretical plates are not less than 2000, tailing factor is not more than 2.0 and the relative standard deviation of replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_8H_{17}NO_2$ in the capsules.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of Pregabalin.

Pregelatinised Starch

Pregelatinised Starch is prepared from maize starch, potato starch or rice starch by mechanical processing in the presence of *water*, with or without heat, to rupture all or part of the starch granules and subsequent drying. It contains no added substances but it may be modified to render it compressible and to improve its flow characteristics.

Description. A white or yellowish-white powder.

Identification

A. *Microscopic*— In a mixture of equal volumes of *glycerol* and *water*, it presents irregular, translucent, white or yellowish-white flakes or pieces with an uneven surface. Under polarised light (between crossed nicol prisms), starch granules with a distinct black cross intersecting at the hilum may be seen.

B. Disperse 0.5 g in 2 ml of *water* without heating, add 0.05 ml of *iodine solution*; a reddish-violet to blue colour is produced.

Tests

pH (2.4.24). 4.5 to 7.0, determined in 3.0 per cent w/v solution in *carbon dioxide-free water*.

Oxidising substances. Transfer 4.0 g to a glass-stoppered, 125 ml conical flask and add 50.0 ml of a mixture of equal volumes of *water* and *methanol*. Insert the stopper and swirl for 5 minutes. Transfer to a glass-stoppered 50 ml centrifuge tube and centrifuge. Transfer 30.0 ml of the clear supernatant liquid to a glass-stoppered 125-ml conical flask. Add 1 ml of *glacial acetic acid* and 0.5 g to 1.0 g of *potassium iodide*. Insert the stopper, swirl, and allow to stand for 30 minutes in the dark. Add 1 ml of *starch solution* and titrate with *0.002 M sodium thiosulphate* until the starch-iodine colour disappears. Carry out a blank titration. Not more than 1.4 ml of *0.002 M sodium thiosulphate* is required (0.002 per cent, calculated as H_2O_2).

1 ml of 0.002 M *sodium thiosulphate* is equivalent to 0.034 mg of oxidising substances, calculated as H_2O_2.

Sulphur dioxide (2.3.40). Not more than 50 ppm.

Iron (2.3.14). Dissolve the residue obtained in the test for Sulphated ash in 20 ml of *dilute hydrochloric acid*, filter. 10 ml of the filtrate complies with the limit test for iron (20 ppm).

Foreign matter. Examined under a microscope using a mixture of equal volumes of *glycerol* and *water*, not more than traces of matter other than starch granules are present.

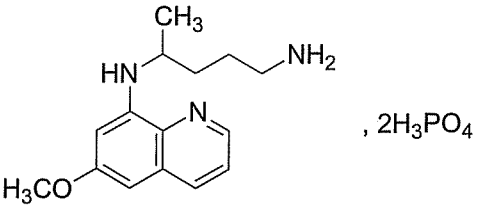
Sulphated ash (2.3.18). Not more than 0.6 per cent.

Loss on drying (2.4.19). Not more than 15.0 per cent, determined on 1.0 g by drying in an oven at 130° for 90 minutes.

Microbial contamination (2.2.9). Total viable aerobic count is not more than 10^3 bacteria and 10^2 fungi per gram, determined by plate count. It complies with the test for *Escherichia coli*.

Labelling. The label states the type of starch used as starting material.

Primaquine Phosphate



$C_{15}H_{21}N_3O,2H_3PO_4$ Mol. Wt. 455.3

Primaquine Phosphate is (*RS*)-8-(4-amino-1-methylbutylamino)-6-methoxyquinoline diphosphate.

Primaquine Phosphate contains not less than 98.5 per cent and not more than 101.5 per cent of $C_{15}H_{21}N_3O,2H_3PO_4$, calculated on the dried basis.

Category. Antimalarial.

Dose. The equivalent of 15 mg of primaquine, once a day for 14 days.

Description. An orange, crystalline powder; odourless or almost odourless.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *primaquine phosphate RS* or with the reference spectrum of primaquine phosphate.

B. When examined in the range 300 nm to 450 nm (2.4.7), a 0.015 per cent w/v solution in *0.01 M hydrochloric acid* shows absorption maxima at about 332 nm and 415 nm; absorbance at about 332 nm, about 0.68 to 0.78 and at about 415 nm, 0.41 to 0.53. Dilute 5 ml of the solution to 50 ml with *0.01 M hydrochloric acid*. When examined in the range 215 nm to

310 nm, the resulting solution shows absorption maxima at about 225 nm, 265 nm and 282 nm; absorbances at the maxima are 0.74 to 0.77, 0.50 to 0.53 and 0.50 to 0.52, respectively.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel F254*.

Mobile phase. A mixture of 60 volumes of *chloroform*, 40 volumes of *methanol* and 1 volume of *strong ammonia solution*.

Test solution. Dissolve 0.2 g in 5 ml of *water*, dilute to 10 ml with *methanol* and dilute 1 volume of the resulting solution to 10 volumes with *methanol (50 per cent)*.

Reference solution. Dissolve 20 mg of *primaquine phosphate RS* in 5 ml of *water*, dilute to 10 ml with *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

D. Dissolve 50 mg in 5 ml of *water*, add 2 ml of *2 M sodium hydroxide* and shake with two quantities, each of 5 ml, of *chloroform*. The aqueous layer, acidified by the addition of *nitric acid*, gives reaction B of phosphates (2.3.1).

Tests

pH (2.4.24). 2.5 to 3.5, determined in a 1.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Add 0.2 ml of *strong ammonia solution* to 1 ml of a 1.0 per cent w/v solution of the substance under examination, shake with 10 ml of the mobile phase and use the clear, lower layer.

Reference solution (a). Dilute 3 ml of the test solution to 100 ml with the mobile phase.

Reference solution (b). Dilute 1 ml of the test solution to 10 ml with the mobile phase and further dilute 1 ml of the resulting solution to 50 ml with the same solvent.

Reference solution (c). Add 0.2 ml of *strong ammonia solution* to 1 ml of a 1.0 per cent w/v solution of the *primaquine phosphate RS*, shake with 10 ml of the mobile phase and use the clear, lower layer.

Chromatographic system

- a stainless steel column 20 cm x 4.6 mm, packed with porous silica particles (10 µm),
- mobile phase: a mixture of 45 volumes of *chloroform*, 45 volumes of *hexane*, 10 volumes of *methanol* and 0.1 volume of *strong ammonia solution*,
- flow rate. 3 ml per minute,
- spectrophotometer set at 261 nm,
- injection volume. 20 µl.

The test is not valid unless in the chromatogram obtained with reference solution (c) there is a peak just before the principal peak with an area of about 6 per cent of that of the principal peak and the resolution between these peaks is not less than 2.0.

Inject each solution and record the chromatograms for at least twice the retention time of primaquine. The sum of the areas of any secondary peaks in the chromatogram obtained with the test solution is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a). Ignore any peak the area of which is less than that of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.2 g, dissolve in 40 ml of *anhydrous glacial acetic acid* with gentle heating. Titrate with *0.1 M perchloric acid*, determining the end point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02277 g of $C_{15}H_{21}N_3O,2H_3PO_4$.

Storage. Store protected from light and moisture.

Primaquine Tablets

Primaquine Phosphate Tablets

Primaquine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of primaquine, $C_{15}H_{21}N_3O$. The tablets are coated.

Usual strength. The equivalent of 2.5 mg of primaquine (13 mg of Primaquine Phosphate is approximately equivalent to 7.5 mg of primaquine).

Identification

A. Dissolve a quantity of the powdered tablets containing 60 mg of primaquine in a mixture of 10 ml of *water* and 2 ml of *2 M sodium hydroxide* and extract with two quantities, each of 20 ml, of *chloroform*. Wash the chloroform extracts with *water*, dry over *anhydrous sodium sulphate*, evaporate to dryness and dissolve the residue in 2 ml of *chloroform*. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *primaquine phosphate RS* or with the reference spectrum of primaquine.

B. Extract a quantity of the powdered tablets containing 25 mg of primaquine with 10 ml of *water* and filter. To 2 ml of the filtrate add 3 ml of *water* and 1 ml of a 5 per cent w/v solution

of *ceric ammonium sulphate* in *2 M nitric acid*; a deep violet colour is produced immediately.

Tests

Uniformity of content. Comply with the tests stated under Tablets.

Transfer one tablet into a suitable container, add 5 ml of *hydrochloric acid*, disperse the tablet in about 25 g of crushed ice and add sufficient *water* to produce 50.0 ml. Carry out the nitrite titration (2.3.31), using *0.01 M sodium nitrite* as titrant. Carry out a blank titration.

1 ml of *0.01 M sodium nitrite* is equivalent to 0.002594 g of $C_{15}H_{21}N_3O$.

Other tests. Comply with the tests stated under Tablets.

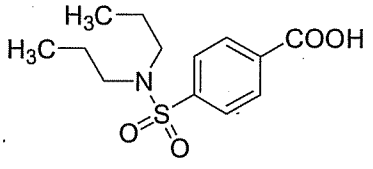
Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 0.15 g of primaquine, dissolve in 20 ml of *water*, add 5 ml of *2 M sodium hydroxide* and extract with four quantities, each of 25 ml of *chloroform*. Combine the chloroform extracts and evaporate to a volume of about 10 ml. Add 40 ml of *anhydrous glacial acetic acid*, Titrate with *0.1 M perchloric acid*, determining the end point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01297 g of $C_{15}H_{21}N_3O$.

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the equivalent amount of primaquine.

Probenecid



$C_{13}H_{19}NO_4S$ Mol. Wt. 285.4

Probenecid is 4-(dipropylsulphamoyl)benzoic acid.

Probenecid contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{13}H_{19}NO_4S$, calculated on the dried basis.

Category. Uricosuric agent and for delaying renal excretion of penicillins and cephalosporins.

Dose. 250 mg to 500 mg twice daily.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *probenecid RS* or with the reference spectrum of probenecid.

B. When examined in the range 210 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in a mixture of 9 volumes of *ethanol (95 per cent)* and 1 volume of *0.1 M hydrochloric acid* shows absorption maxima at about 223 nm and 248 nm; absorbance at about 248 nm is about 0.33.

C. Dissolve 0.2 g in about 0.6 ml of *2 M ammonia* and add 3 ml of 1.7 per cent w/v solution of *silver nitrate*; a white precipitate is produced which is soluble in an excess of *dilute ammonia solution*.

Tests

Appearance of solution. A 10.0 per cent w/v solution in *2 M sodium hydroxide* is clear (2.4.1), and not more intensely coloured than reference solution YS6 (2.4.1).

Acidity. Add 2.0 g to 100 ml of *water*, heat on a water-bath for 30 minutes, cool, filter and dilute with *water* to 100.0 ml. Titrate 50.0 ml of the solution with *0.1 M sodium hydroxide* using *phenolphthalein solution* as indicator. Not more than 0.5 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 55 volumes of *toluene*, 20 volumes of *di-isopropyl ether*, 15 volumes of *chloroform* and 10 volumes of *glacial acetic acid*.

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of *acetone*.

Reference solution. A 0.005 per cent w/v solution of the substance under examination in *acetone*.

Apply to the plate 20 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Heavy metals (2.3.13).1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.5 g and dissolve in 100 ml of *ethanol (95 per cent)*, shaking well and heating gently if

necessary. Cool and titrate with *0.1 M sodium hydroxide*, using *bromothymol blue solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.02854 g of $C_{13}H_{19}NO_4S$.

Storage. Store protected from moisture.

Probenecid Tablets

Probenecid Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of probenecid, $C_{13}H_{19}NO_4S$.

Usual strength. 500 mg.

Identification

A. Triturate a quantity of the powdered tablets containing 0.5 g of Probenecid with *ethanol (95 per cent)*, filter and concentrate the filtrate by evaporation on a water-bath. Cool, filter and recrystallise the residue from *ethanol (50 per cent)*. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *probenecid RS* or with the reference spectrum of probenecid.

B. When examined in the range 210 nm to 360 nm (2.4.7), the final solution obtained in the Assay shows absorption maxima at about 225 nm and 248 nm.

C. The residue obtained in test A melts at about 199° (2.4.21).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 55 volumes of *toluene*, 20 volumes of *di-isopropyl ether*, 15 volumes of *chloroform* and 10 volumes of *glacial acetic acid*.

Test solution. Extract a quantity of the powdered tablets containing 0.2 g of Probenecid with 20 ml of *acetone*, filter and use the filtrate.

Reference solution. Dilute 1 ml of the test solution to 200 ml with *acetone*.

Apply to the plate 20 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Dissolution (2.5.2).

Apparatus. No. 1,

Medium. 900 ml of *phosphate buffer pH 7.6*,

Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter, Dilute 4.0 ml of the filtrate to 100.0 ml with *0.1 M sodium hydroxide*. Measure the absorbance of the resulting solution at the maximum at about 244 nm (2.4.7). Similarly measure the absorbance of a solution of a known concentration of *probenecid RS*. Calculate the content of $C_{13}H_{19}O_4S$.

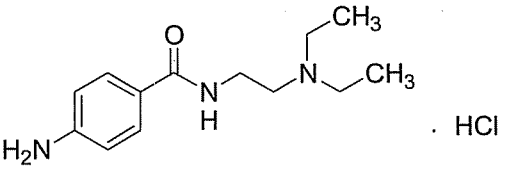
D. Not less than 80 per cent of the stated amount of $C_{13}H_{19}NO_3S$.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 0.2 g of Probencid, add 200 ml of *ethanol (95 per cent)* and 5 ml of *1 M hydrochloric acid*, heat on a water-bath at 70° for 30 minutes, shaking occasionally. Cool, add sufficient *ethanol (95 per cent)* to produce 250.0 ml and filter. To 5.0 ml of the filtrate add 5 ml of *0.1 M hydrochloric acid*, dilute to 250.0 ml with *ethanol (95 per cent)* and measure the absorbance of the resulting solution at the maximum at about 248 nm (2.4.7). Calculate the content of $C_{13}H_{19}NO_4S$ taking 332 as specific absorbance at 248 nm.

Storage. Store protected from moisture.

Procainamide Hydrochloride



$C_{13}H_{21}N_3O,HCl$ Mol. Wt. 271.8

Procainamide Hydrochloride is 4-amino-*N*-[2-(diethylamino) ethyl)benzamide hydrochloride.

Procainamide Hydrochloride contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{13}H_{21}N_3O,HCl$, calculated on the dried basis.

Category. Antiarrhythmic.

Dose. Orally, 500 mg to 1.5 g daily, in divided doses; by slow intravenous injection

Description. A white or very slightly yellow, crystalline powder; hygroscopic.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *procainamide hydrochloride RS* or with the reference spectrum of procainamide hydrochloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *0.1 M sodium hydroxide* shows an absorption maximum at about 273 nm; absorbance at about 273 nm, 0.58 to 0.61.

C. Dilute 1 ml of a solution, prepared by dissolving 2.5 g in sufficient *carbon dioxide-free water* to produce 25 ml, to 2 ml with *water*. 1 ml of this solution gives the reaction of primary aromatic amines (2.3.1).

D. A 2 per cent w/v solution gives reaction A of chlorides (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and not more intensely coloured than reference solution BS6 (2.4.1).

pH (2.4.24). 5.6 to 6.3, determined in a 10.0 per cent w/v solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 60 volumes of *1-butanol*, 30 volumes of *water* and 15 volumes of *glacial acetic acid*.

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of *ethanol (95 per cent)*.

Reference solution. A 0.005 per cent w/v solution of the substance under examination in *ethanol (95 per cent)*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.25 g, dissolve in 75 ml of *water* and 10 ml of *hydrochloric acid* and carry out the nitrite titration (2.3.31).

1 ml of *0.1 M sodium nitrite* is equivalent to 0.02718 g of $C_{13}H_{21}N_3O$, HCl.

Storage. Store protected from light.

Procainamide Injection

Procainamide Hydrochloride Injection

Procainamide Injection is a sterile solution of Procainamide Hydrochloride in Water for Injections. It may contain Sodium Metabisulphite as a stabilising agent.

Procainamide Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of procainamide hydrochloride, $C_{13}H_{21}N_3O$, HCl.

Usual strength. 100 mg per ml.

Identification

A. Dilute a volume containing 0.25 g of Procainamide Hydrochloride to 25 ml with *water*, make alkaline with *5 M sodium hydroxide* and extract with two quantities, each of 5 ml, of *chloroform*. Filter the combined extracts through *anhydrous sodium sulphate*, evaporate the filtrate to dryness using a rotatory evaporator and dissolve the residue in 5 ml of *chloroform*.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *procainamide hydrochloride RS* or with the reference spectrum of procainamide.

B. Dilute a suitable volume of the injection with *water* to produce a solution containing 0.0005 per cent w/v of Procainamide Hydrochloride. Absorbance of the resulting solution at about 280 nm, about 0.30 (2.4.7).

C. Gives the reactions of chlorides (2.3.1).

Tests

pH (2.4.24). 4.0 to 5.5.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 60 volumes of *1-butanol*, 30 volumes of *water* and 15 volumes of *glacial acetic acid*.

Test solution. Dilute a volume of the injection containing 0.1 g of Procainamide Hydrochloride to 5 ml with *methanol*.

Reference solution. Dilute 1 volume of the test solution to 100 volumes with *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. To a volume containing about 0.25 g of Procainamide Hydrochloride add 45 ml of *6 M hydrochloric acid* and boil for 1 minute. Carry out the nitrite titration (2.3.31).

1 ml of *0.1 M sodium nitrite* is equivalent to 0.02718 g of $C_{13}H_{21}N_3O,HCl$.

Storage. Store protected from light.

Procainamide Tablets

Procainamide Hydrochloride Tablets

Procainamide Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of procainamide hydrochloride, $C_{13}H_{21}N_3O,HCl$.

Usual strength. 250 mg.

Identification

A. Shake a quantity of the powdered tablets containing 0.25 g of Procainamide Hydrochloride with 25 ml of *water*, make alkaline with *5 M sodium hydroxide* and extract with two quantities, each of 5 ml, of *chloroform*. Filter the combined extracts through *anhydrous sodium sulphate*, evaporate the filtrate to dryness using a rotatory evaporator and dissolve the residue in 5 ml of *chloroform*.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *procainamide hydrochloride RS* or with the reference spectrum of procainamide.

B. Triturate a quantity of the powdered tablets containing 1 g of Procainamide Hydrochloride with 10 ml of *water* and filter. The filtrate gives the reactions of chlorides (2.3.1).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 60 volumes of *1-butanol*, 30 volumes of *water* and 15 volumes of *glacial acetic acid*.

Test solution. Shake a quantity of the powdered tablets containing 0.4 g of Procainamide Hydrochloride with 20 ml of *methanol (90 per cent)* for 15 minutes and filter.

Reference solution. Dilute 1 volume of the test solution to 100 volumes with *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

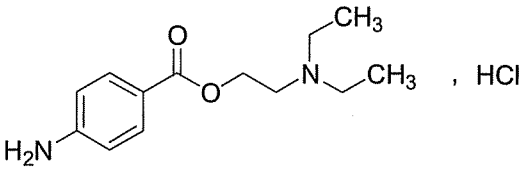
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 0.25 g of Procainamide Hydrochloride, add 100 ml of *6 M hydrochloric acid*, shake for 15 minutes and boil for 1 minute. Carry out the nitrite titration (2.3.31).

1 ml of *0.1 M sodium nitrite* is equivalent to 0.02718 g of $C_{13}H_{21}N_3O,HCl$.

Storage. Store protected from light and moisture.

Procaine Hydrochloride



$C_{13}H_{20}N_2O_2,HCl$ Mol. Wt. 272.8

Procaine Hydrochloride is 2-(diethylamino)ethyl 4-aminobenzoate hydrochloride.

Procaine Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{13}H_{20}N_2O_2,HCl$, calculated on the dried basis.

Category. Local anaesthetic.

Dose. To be adjusted according to the site of operation and response of the patient.

Description. Colourless crystals or a white, crystalline powder; odourless.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B, C and D may be omitted if tests A and E are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *procaine hydrochloride RS* or with the reference spectrum of procaine hydrochloride.

B. To 0.2 ml of a 5 per cent w/v solution add 2 ml of *water* and 0.5 ml of *1 M sulphuric acid*, shake and add 1 ml of a 0.1 per cent w/v solution of *potassium permanganate*; the colour is immediately discharged.

C. To about 5 mg add 0.5 ml of *fuming nitric acid*, evaporate to dryness on a water-bath, cool, dissolve the residue in 5 ml of *acetone* and add 1 ml of *0.1 M ethanolic potassium hydroxide*; only a brownish red colour develops.

D. Dilute 1 ml of a 5 per cent w/v solution to 100 ml with *water*; 2 ml of the solution gives the reaction of primary aromatic amines (2.3.1).

E. Gives reaction A of chlorides (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and colourless (2.4.1).

pH (2.4.24). 5.0 to 6.5, determined in a 2.0 per cent w/v solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 80 volumes of *dibutyl ether*, 16 volumes of *n-hexane* and 4 volumes of *glacial acetic acid*.

Test solution. A 10 per cent w/v solution of the substance under examination in *water*.

Reference solution. A 0.005 per cent w/v solution of *4-aminobenzoic acid* in *water*.

Apply to the plate 5 µl of each solution. After development, dry the plate at 105° for 10 minutes and examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution. The principal spot remains on the line of application.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method A (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.3 g, dissolve in 50 ml of *2 M hydrochloric acid*, add 3 g of *potassium bromide*, cool in ice and titrate slowly with *0.1 M sodium nitrite*, stirring constantly. Determine the end point potentiometrically (2.4.25).

1 ml of *0.1 M sodium nitrite* is equivalent to 0.02728 g of $C_{13}H_{20}N_2O_2$, HCl.

Storage. Store protected from light.

Procaine and Adrenaline Injection

Procaine Hydrochloride and Adrenaline Bitartrate Injection; Procaine Hydrochloride and Epinephrine Bitartrate Injection

Procaine and Adrenaline Injection is a sterile solution of Procaine Hydrochloride and Adrenaline Bitartrate in Water for Injections.

Procaine and Adrenaline Injection contains not less than 1.9 per cent and not more than 2.1 per cent w/v of procaine hydrochloride, $C_{13}H_{20}N_2O_2$, HCl and the equivalent of not less than 0.00175 per cent and not more than 0.00225 per cent w/v of adrenaline, $C_9H_{13}NO_3$.

Description. A clear, colourless solution.

Identification

A. To 5 ml add 5 ml of *water* and 10 ml of *picric acid solution*, shake gently and set aside for 1 hour; the crystalline precipitate, after washing with *water* and drying at 100°, melts at about 134° (2.4.21).

B. To 5 ml add 1 ml of *hydrochloric acid*, cool to 0°, add 5 ml of *sodium nitrite solution* and pour the mixture into 2 ml of *2-naphthol solution* containing 1 g of *sodium acetate*; an orange-red colour is produced.

C. To 10 ml add 4 ml of *disodium hydrogen phosphate solution* and sufficient *0.1 M iodine* to produce a distinct brown colour. Add *0.1 M sodium thiosulphate* to remove the excess of iodine; a pink colour is produced.

Tests

pH (2.4.24). 3.0 to 5.5.

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. *For procaine hydrochloride* — To 10.0 ml of the injection add 0.5 g of *sodium carbonate* and extract with three quantities, each of 20 ml, of a mixture of 1 volume of *2-propanol* and 3 volumes of *chloroform* until complete extraction of procaine is effected. Shake the combined extracts with 5 ml of *water*, wash the water with the solvent mixture and add the washing to the combined extracts. Shake the combined extracts and washings with 10.0 ml of *0.1 M hydrochloric acid*, separate the acid layer, wash the combined extracts and washings with 5 ml of *water*, add the aqueous extract to the separated acid layer and titrate with *0.1 M sodium hydroxide*, using *methyl red-methylene blue solution* as indicator.

1 ml of *0.1 M hydrochloric acid* is equivalent to 0.02728 g of $C_{13}H_{20}N_2O_2$,HCl.

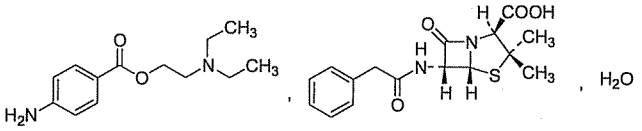
For adrenaline — To 10.0 ml of the injection add 20 mg of *sodium metabisulphite*, 0.1 ml of *ferrous sulphate-citrate solution*, 1 ml of *glycine buffer solution* and mix. Allow to stand for 10 minutes, extract with 10 ml of *ether*, allow to separate, reject the *ether* and measure the absorbance of a 4-cm layer of the solution at about 540 nm (2.4.7). Calculate the content of adrenaline, $C_9H_{13}NO_3$, from a reference curve prepared by treating suitable aliquots of a solution of *adrenaline bitartrate RS* in the same manner.

1 mg of adrenaline bitartrate is equivalent to 0.0005497 g of $C_9H_{13}NO_3$.

Storage. Store protected from light.

Labelling. The label states the strength as "Procaine Hydrochloride, 2 per cent w/v; Adrenaline, 0.002 per cent w/v".

Procaine Penicillin



$C_{13}H_{20}N_2O_2,C_{16}H_{18}N_2O_4S,H_2O$ Mol. Wt. 588.7

Procaine Penicillin is 2-diethylaminoethyl 4-aminobenzoate (6*R*)-6-(2-phenylacetamido)penicillanate monohydrate.

Procaine Penicillin contains not less than 51 per cent and not more than 59.6 per cent of penicillin G, calculated as $C_{16}H_{18}N_2O_4S$, and not less than 37.5 per cent and not more than 43.0 per cent of procaine, $C_{13}H_{20}N_2O_2$, both calculated on the anhydrous basis.

Category. Antibacterial.

Dose. By intramuscular injection, 300 to 900 mg daily (300 mg of Procaine Penicillin is approximately equivalent to 200 mg of benzylpenicillin).

Description. A white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *procaine penicillin RS* or with the reference spectrum of procaine penicillin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution (a).

C. A turbid solution of 0.1 g in 2 ml of *2 M hydrochloric acid* gives the reaction of primary aromatic amines (2.3.1).

Tests

pH (2.4.24). 5.0 to 7.5, determined in a solution prepared by shaking 50 mg in sufficient *carbon dioxide-free water* to produce 15 ml until dissolution is complete.

Specific optical rotation (2.4.22). +165° to +180°, determined in a solution prepared by dissolving 0.25 g in sufficient of a mixture of 3 volumes of *acetone* and 2 volumes of *water* to produce 25 ml.

Water (2.3.43). 2.8 to 4.2 per cent, determined on 0.5 g.

Assay. Determine the contents of benzyl penicillin and procaine by liquid chromatography (2.4.14).

Test solution. Weigh accurately 70 mg of the substance under examination and dissolve in 30 ml of the mobile phase with the aid of ultrasound for about 2 minutes. Dilute to 50.0 ml with the mobile phase.

Reference solution (a). Weigh accurately about 56 mg of *benzyl penicillin potassium RS* and 40 mg of *procaine hydrochloride RS* and dissolve in 25 ml of the mobile phase with the aid of ultrasound for about 2 minutes. Dilute to 50.0 ml with the mobile phase.

Reference solution (b). Mix 1 volume of a 0.24 per cent w/v solution of *phenoxymethylpenicillin potassium RS* in the mobile phase with 3 volumes of reference solution (a).

Chromatographic system
- a stainless steel column 30 cm x 4 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 50 volumes of a solution prepared by mixing 14 g of *potassium dihydrogen phosphate* in 6.5 g of *tetrabutylammonium hydroxide (40 per cent)* and adjusting the pH to 7.0 with *1 M potassium hydroxide* or *dilute phosphoric acid*, 25 volumes of *acetonitrile* and 25 volumes of *water*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume. 20 µl.

Inject reference solution (b). The resolution between benzyl penicillin potassium and phenoxymethylpenicillin potassium is not less than 2. The relative retention time of procaine with reference to benzyl penicillin is about 2.2.

Inject the test solution and reference solution (a). Record the peak responses of the main peaks of benzyl penicillin and procaine. Calculate the content of benzyl penicillin, $C_{16}H_{18}N_2O_4S$ and the content of procaine, $C_{13}H_{20}N_2O_2$ using the factor of 0.866 for converting the content of procaine hydrochloride to that of procaine.

Procaine Penicillin intended for use in the manufacture of Parenteral Preparations without a further procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.10 Endotoxin Unit per mg.

Procaine Penicillin intended for use in the manufacture of Parenteral Preparations without a further sterilisation procedure complies with the following additional requirement.

Sterility. Complies with the test for sterility (2.2.11).

Storage. Store protected from moisture. If the material is intended for use in the manufacture of parenteral preparations, the container should be sterile and sealed so as to exclude micro-organisms.

Labelling. The label states (1) where applicable, that the contents are free from bacterial endotoxins; (2) where applicable, that the contents are sterile.

Fortified Procaine Penicillin Injection

Procaine Penicillin with Benzylpenicillin Injection

Fortified Procaine Penicillin Injection is a sterile mixture of five parts of Procaine Penicillin and one part of Benzylpenicillin Potassium or Benzylpenicillin Sodium, together with suitable dispersing and buffering agents. It is filled in a sealed container.

The injection is constituted by suspending the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

Storage. The constituted injection should be used within 24 hours (4 days if a buffering agent is present) of preparation when stored at a temperature not exceeding 20° or within 7 days (14 days if a buffering agent is present) when stored at a temperature between 2° and 8°.

Fortified Procaine Penicillin Injection contains a quantity of total penicillins calculated as $C_{16}H_{17}N_2NaO_4S$ and equivalent to not less than 60.0 per cent and not more than 74.0 per cent of the stated amounts of procaine penicillin and benzylpenicillin potassium or benzylpenicillin sodium and a quantity of procaine, $C_{13}H_{20}N_2O_2$, equivalent to not less than 36.0 per cent and not more than 44.0 per cent of the stated amount of procaine penicillin.

Usual strengths. Procaine Penicillin, 300 mg (300,000 Units) and Benzylpenicillin Potassium or Benzylpenicillin Sodium 60 mg (100,000 Units), Procaine Penicillin 3 g (3,000,000 Units) and Benzylpenicillin Potassium or Benzylpenicillin Sodium, 600 mg (1,000,000 Units).

Description. A white or almost white powder.

The contents of the sealed container comply with the tests stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Identification

A. Dissolve 10 mg in 10 ml of *water* and add 0.5 ml of *neutral red solution*. Add sufficient *0.01 M sodium hydroxide* to give a permanent orange colour and then add 1 ml of *penicillinase solution*; a red colour is produced rapidly.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

C. Give the reaction of primary aromatic amines (2.3.1), producing a bright, orange-red precipitate.

Tests

Water (2.3.43). Not more than 3.5 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh accurately a quantity of the mixed contents of 10 containers equivalent to about 70 mg of procaine penicillin and dissolve in 30 ml of the mobile phase with the aid of ultrasound for about 2 minutes. Dilute to 50.0 ml with the mobile phase.

Reference solution (a). Weigh accurately about 56 mg of *benzylpenicillin potassium RS* and 40 mg of *procaine hydrochloride RS* and dissolve in 25 ml of the mobile phase with the aid of ultrasound for about 2 minutes. Dilute to 50.0 ml with the mobile phase.

Reference solution (b). Mix 1 volume of a 0.24 per cent w/v solution of *phenoxymethylpenicillin potassium RS* in the mobile phase with 3 volumes of reference solution (a).

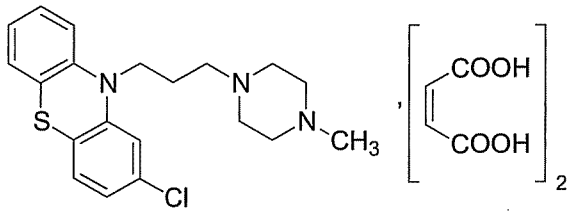
Chromatographic system
- a stainless steel column 30 cm x 4 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: a mixture of 50 volumes of a solution containing 1.4 per cent w/v of *potassium dihydrogen orthophosphate* and 0.65 per cent w/v *tetrabutyl ammonium hydroxide* adjusted to pH 7.0 with *1 M potassium hydroxide* or *orthophosphoric acid*, 25 volumes of *acetonitrile* and 25 volumes of *water*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume. 20 µl.

Inject reference solution (b). The resolution between benzylpenicillin potassium and phenoxymethylpenicillin potassium is not less than 2. The relative retention time of procaine with reference to benzylpenicillin is about 2.2.

Inject the test solution and reference solution (a). Record the peak responses of the main peaks of benzyl penicillin and procaine. Calculate the total penicillin content as benzylpenicillin, $C_{16}H_{18}N_2O_4S$ and the content of procaine, $C_{13}H_{20}N_2O_2$ using the factor of 0.866 for converting the content of procaine hydrochloride to that of procaine.

Labelling. The label states (1) the quantities of Procaine Penicillin and Benzylpenicillin Potassium or Benzylpenicillin Sodium contained in it; (2) the names of any added dispersing and buffering agents; (3) "for intramuscular injection only".

Prochlorperazine Maleate



$C_{20}H_{24}ClN_3S,2C_4H_4O_4$ Mol. Wt. 606.1

Prochlorperazine Maleate is 2-chloro-10-[3-(4-methylpiperazin-1-yl)propyl]phenothiazine di(hydrogen maleate).

Prochlorperazine Maleate contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{20}H_{24}ClN_3S$, $2C_4H_4O_4$, calculated on the dried basis.

Category. Antipsychotic; antiemetic.

Dose. As antipsychotic, 15 to 100 mg daily, in divided doses; as antiemetic, 10 to 30 mg daily, in divided doses.

Description. A white or pale yellow, crystalline powder; practically odourless.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. To 20 mg add 5 ml of *water* and 1 ml of *1 M sodium hydroxide*, shake and extract with 10 ml of *ether*. Wash the ether extract with 5 ml of *water*, dry with *anhydrous sodium sulphate*, evaporate to dryness and dissolve the residue in 0.2 ml of *chloroform*.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *prochlorperazine maleate RS* or with the reference spectrum of prochlorperazine.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *ethanol (95 per cent)* containing 0.01 per cent v/v of *strong ammonia solution* shows an absorption maximum at about 258 nm and a less well-defined maximum at about 313 nm; absorbance at about 258 nm, about 0.6.

C. Complies with the test for identification of phenothiazines (2.3.3).

Test solution. A solution containing 0.1 per cent w/v of the substance under examination in a mixture of equal volumes of *methanol* and *chloroform*.

Reference solution. A 0.1 per cent w/v solution of *prochlorperazine maleate RS* in the same solvent mixture.

Apply 4 µl of each solution.

D. Triturate 0.2 g with a mixture of 3 ml of *water* and 1 ml of *10 M sodium hydroxide* and shake with three quantities, each of 5 ml, of *ether*. To 0.1 ml of the aqueous layer add a solution of 10 mg of *resorcinol* in 3 ml of *sulphuric acid* and heat on a water-bath for 15 minutes; no colour develops. To the remainder of the aqueous layer add 2 ml of *bromine solution*, heat on a water-bath for 15 minutes, then heat to boiling and cool. To 0.1 ml of the solution add a solution of 10 mg of *resorcinol* in 3 ml of *sulphuric acid* and heat on a water-bath for 15 minutes; a blue colour develops.

Tests

pH (2.4.24). 3.0 to 4.0, determined in a freshly prepared saturated solution.

Related substances. Complies with the test for Related substances in Phenothiazines (2.3.5), using mobile phase A.

NOTE— Prepare the test solution immediately before use.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.2 g, in powder, dissolve in 50 ml of *anhydrous glacial acetic acid*, heating gently on a water-bath, allow to cool. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03031 g of $C_{20}H_{24}ClN_3S,2C_4H_4O_4$.

Storage. Store protected from light and moisture.

Prochlorperazine Tablets

Prochlorperazine Maleate Tablets

Prochlorperazine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of prochlorperazine maleate, $C_{20}H_{24}ClN_3S,2C_4H_4O_4$.

Usual strengths. 5 mg; 25 mg.

Identification

A. To a quantity of the powdered tablets containing 40 mg of Prochlorperazine Maleate add 10 ml of *water* and 2 ml of *1 M sodium hydroxide*, shake and extract with 15 ml of *ether*. Wash the ether with 5 ml of *water*, dry with *anhydrous sodium sulphate*, evaporate to dryness and dissolve the residue in 0.4 ml of *chloroform*.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with

prochlorperazine maleate RS or with the reference spectrum of prochlorperazine.

B. To a quantity of the powdered tablets containing 5 mg of Prochlorperazine Maleate add 5 ml of *sulphuric acid* and allow to stand for 5 minutes; a red colour is produced.

C. Shake a quantity of the powdered tablets containing 0.2 g of Prochlorperazine Maleate with 2 ml of *water* and 1 ml of *5 M sodium hydroxide*, mix and extract with three quantities, each of 10 ml, of *ether*. Dry the combined extracts with *anhydrous sodium sulphate*, filter, evaporate the filtrate to dryness and dissolve the residue in 10 ml of *methanol* and add a solution of 0.15 g of *picric acid* in 10 ml of *methanol*. The precipitate, after washing with a small quantity of *methanol*, melts at about 255°, with decomposition (2.4.21).

Tests

Related substances. Comply with the test for Related substances in Phenothiazines (2.3.5), using mobile phase A.

NOTE— Prepare the following solutions freshly.

Test solution. Extract a quantity of the powdered tablets containing 0.1 g of Prochlorperazine Maleate with 10 ml of *methanol* containing 0.5 per cent v/v of *strong ammonia solution* and filter.

Reference solution. Dilute 1.0 ml of the test solution to 200.0 ml with the same solvent.

Apply to the plate 20 µl of each solution.

Uniformity of content. *(For tablets containing 10 mg or less)* — Comply with the test stated under Tablets.

NOTE— Protect the solutions from light throughout the Assay.

Crush one tablet and extract with three quantities, each of 10 ml, of *ethanol* containing 1 per cent v/v of *strong ammonia solution*. Filter the extracts and to the combined filtrates add sufficient *ethanol* to produce 50.0 ml. Dilute 10.0 ml of this solution to 100.0 ml with *ethanol*. Dilute further with *ethanol*, if necessary, to give a final solution containing 10 µg of Prochlorperazine Maleate per ml and measure the absorbance of the resulting solution at the maximum at about 258 nm (2.4.7). Calculate the content of $C_{20}H_{24}ClN_3S$, $2C_4H_4O_4$ taking 620 as the specific absorbance at 258 nm.

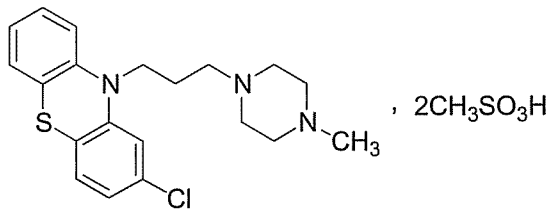
Other tests. Comply with the tests stated under Tablets.

Assay. *Protect the solutions from light throughout the Assay.*

Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 25 mg of Prochlorperazine Maleate and extract with three quantities, each of 10 ml, of *ethanol* containing 1 per cent v/v of *strong ammonia solution*. Filter the extracts and to the combined filtrates add sufficient *ethanol* to produce 100.0 ml. Dilute 10.0 ml to 50.0 ml with *ethanol*, dilute 10.0 ml of this solution to 50.0 ml with *ethanol* and measure the absorbance of the resulting solution at the maximum at about 258 nm (2.4.7). Calculate the content of $C_{20}H_{24}ClN_3S$, $2C_4H_4O_4$ taking 620 as the specific absorbance at 258 nm.

Storage. Store protected from light and moisture.

Prochlorperazine Mesylate



$C_{20}H_{24}ClN_3S,2CH_4SO_3$ Mol. Wt. 566.2

Prochlorperazine Mesylate is 2-chloro-10-[3-(4-methylpiperazin-1-yl)propyl]phenothiazine di(methanesulphonate).

Prochlorperazine Mesylate contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{20}H_{24}ClN_3S,2CH_4SO_3$, calculated on the dried basis.

Category. Antipsychotic; antiemetic.

Dose. As antipsychotic, by intramuscular injection, 12.5 to 25 mg, twice or thrice daily; as antiemetic, by intramuscular injection, 12.5 mg.

Description. A white or almost white powder; odourless.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *prochlorperazine mesylate RS* or with the reference spectrum of prochlorperazine mesylate.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *ethanol* containing 0.01 per cent v/v of *strong ammonia solution* shows an absorption maximum at about 258 nm and a less well-defined maximum at about 313 nm; absorbance at about 258 nm, about 0.6.

C. Dissolve 5 mg in 2 ml of *sulphuric acid* and allow to stand for 5 minutes; a red colour is produced.

D. Mix 50 mg with 0.2 g of powdered *sodium hydroxide*, heat to fusion and continue the heating for a few seconds longer. Cool, add 0.5 ml of *water* and a slight excess of *2 M hydrochloric acid* and warm; sulphur dioxide is evolved which turns moistened *starch iodate paper* blue.

Tests

pH (2.4.24). 2.0 to 3.0, determined in a 2.0 per cent w/v solution.

Related substances. Complies with the test for Related substances in Phenothiazines (2.3.5), using mobile phase A.

Test solution. Dissolve the substance under examination in *methanol* containing 0.5 per cent v/v of *strong ammonia solution*.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 100° at a pressure not exceeding 0.7 kPa.

Assay. Weigh accurately about 0.5 g, dissolve in 10 ml of *water*, add 5 ml of *1 M sodium hydroxide* and extract with successive quantities of 50, 25, 25 and 25 ml of *ether*. Wash the combined *ether* extracts with 5 ml of *water*, shake the washings with 5 ml of *ether*, add the *ether* to the combined ether extracts and evaporate to dryness. Add 2 ml of *ethanol*, evaporate to dryness. Titrate with *0.1 M perchloric acid*, using *1-naphtholbenzein solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02831 g of $C_{20}H_{24}ClN_3S, 2CH_4SO_3$.

Storage. Store protected from light and moisture.

Prochlorperazine Injection

Prochlorperazine Mesylate Injection

Prochlorperazine Injection is a sterile solution of Prochlorperazine Mesylate in Water for Injections free from dissolved air.

Prochlorperazine Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of prochlorperazine mesylate, $C_{20}H_{24}ClN_3S,2CH_4SO_3$.

Usual strength. 12.5 mg per ml.

Identification

A. To a volume containing 0.1 g of Prochlorperazine Mesylate add 20 ml of *water* and 2 ml of *10 M sodium hydroxide*. Shake and extract with 25 ml of *ether*. Wash the ether layer with two quantities, each of 5 ml, of *water*, dry with *anhydrous sodium sulphate* and evaporate to dryness. Dissolve the residue in 1 ml of *chloroform*.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *prochlorperazine mesylate RS* treated in the same manner or with the reference spectrum of prochlorperazine.

B. To a volume containing 5 mg of Prochlorperazine Mesylate add carefully 2 ml of *sulphuric acid* and allow to stand for 5 minutes; a red colour is produced.

Tests

pH (2.4.24). 5.5 to 6.5.

Related substances. Carry out the test for Related substances in Phenothiazines (2.3.5), using mobile phase A.

Test solution. Use the injection under examination.

Reference solution (a). Dilute 1.0 ml of the test solution to 40 ml with *methanol* containing 0.5 per cent v/v of *strong ammonia solution* immediately before use.

Reference solution (b). Dilute 1.0 ml of the test solution to 200.0 ml with the *methanol-ammonia mixture* immediately before use.

Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

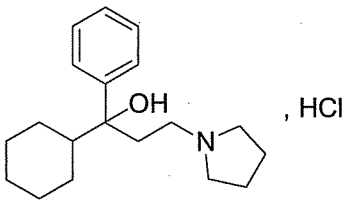
Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. *Protect the solutions from light throughout the Assay.*

To an accurately measured volume containing about 25 mg of Prochlorperazine Mesylate add sufficient *ethanol* containing 0.01 per cent v/v of *strong ammonia solution* to produce 200.0 ml. Dilute 5.0 ml of this solution to 100.0 ml with the *ammoniacal ethanol* and measure the absorbance of the resulting solution at the maximum at about 258 nm (2.4.7). Calculate the content of $C_{20}H_{24}ClN_3S, 2CH_4SO_3$ taking 635 as the specific absorbance at 258 nm.

Storage. Store protected from light.

Procyclidine Hydrochloride



$C_{19}H_{29}NO,HCl$ Mol. wt. 323.9

Procyclidine Hydrochloride is (*RS*)-1-cyclohexyl-1-phenyl-3-pyrrolidin-1-ylpropan-1-ol hydrochloride.

Procyclidine Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{19}H_{29}NO,HCl$, calculated on the dried basis.

Category. Antiparkinsonian.

Dose. Initially, 2.5 mg thrice daily, after meals increasing at intervals of two to three days by 2.5 to 5 mg daily; maximum, 30 mg daily.

Description. A white, crystalline powder, odourless or almost odourless.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *procyclidine hydrochloride RS*.

B. Dissolve 0.25 g in 10 ml of *water*, make alkaline with *5 M ammonia* and extract with three quantities, each of 10 ml, of *ether*. Dry the combined ethereal extracts over *anhydrous sodium sulphate*, filter, remove the ether and scratch the residue with a glass rod to induce solidification. The residue melts at about 85° (2.4.21).

C. Gives the reactions of chlorides (2.3.1).

Tests

pH (2.4.24). 4.5 to 6.5, determined in a 1.0 per cent w/v solution.

Related substances. A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 100 volumes of *ether* and 1 volume of *strong ammonia solution*.

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of *chloroform*.

Reference solution (a). A 0.004 per cent w/v solution of *1-phenyl-3-pyrrolidinopropan-1-one hydrochloride RS* in *chloroform*.

Reference solution (b). A 0.01 per cent w/v solution of the substance under examination in *chloroform*.

Apply to the plate 5 µl of each solution. After development, dry the plate at 105° for 15 minutes and examine in ultraviolet light at 254 nm. Any spot corresponding to 1-phenyl-3-pyrrolidinopropan-1-hydrochloride-1-one in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a). Spray the plate with *dilute potassium iodobismuthate solution*. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b).

B. Determine by gas chromatography (2.4.13).

Test solution. Add 5 ml of *1.25 M sodium hydroxide* to 20 ml of a 0.015 per cent w/v solution of the substance under examination and mix. Extract with two quantities, each of 20 ml, of *ether*, add to the combined extracts 5 ml of a 0.06 per cent w/v solution of *triphenylethylene* (internal standard) in *ether*, shake with *anhydrous sodium sulphate* and filter. Evaporate the filtrate and dissolve the residue in 1 ml of *ether*.

Reference solution (a). Prepare in the same manner as the test solution but using 20 ml of a 0.5 per cent w/v solution of the substance under examination and omitting the addition of the internal standard solution.

Reference solution (b). Prepare in the same manner as the test solution but using 20 ml of a 0.5 per cent w/v solution of the substance under examination.

Chromatographic system

- a glass column 1.5 m x 4 mm, packed with acid-washed, silanised diatomaceous support (such as HP chromosorb W) coated with 10 per cent w/w of modified polyethylene glycol 20M (such as SP-1000) and 2 per cent w/w of *potassium hydroxide*,
- temperature :
  column. 240°,
  inlet port and detector at 240°,
- flow rate. 30 ml per minute of the carrier gas.

The ratio of the sum of the areas of any secondary peaks to the area of the peak due to the internal standard in the chromatogram obtained with reference solution (b) is not more than the ratio of the area of the principal peak to the area of the internal standard peak in the chromatogram obtained with the test solution.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.7 g, dissolve in 75 ml of *anhydrous glacial acetic acid*, warm if necessary to effect solution and cool. Add 10 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.03239 g of $C_{19}H_{29}NO,HCl$.

Storage. Store protected from moisture.

Procyclidine Tablets

Procyclidine Hydrochloride Tablets

Procyclidine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of procyclidine hydrochloride, $C_{19}H_{29}NO,HCl$.

Usual strengths. 2.5 mg; 5 mg.

Identification

A. Dissolve a quantity of the powdered tablets containing about 25 mg of Procyclidine Hydrochloride in 10 ml of *water*, shake with 20 ml of *ether* and discard the ether layer. Make the aqueous layer alkaline with *2 M sodium hydroxide* and extract with two quantities, each of 20 ml, of *ether*. Wash the combined ether extracts with two quantities, each of 10 ml, of *water*, dry by shaking with *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness. If necessary, induce crystallization by scratching with a glass rod.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *procyclidine hydrochloride RS*.

B. The powdered tablets give the reactions of chlorides (2.3.1).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 100 volumes of *ether* and 1 volume of *strong ammonia solution*.

Test solution. Shake a quantity of the powdered tablets containing 25 mg of Procyclidine Hydrochloride with 5 ml of *chloroform* and filter.

Reference solution (a). A 0.001 per cent w/v solution of *1-phenyl-3-pyrrolidinopropan-1-one hydrochloride RS* in *chloroform*.

Reference solution (b). Dilute 1 volume of test solution to 200 volumes with *chloroform*.

Apply to the plate 20 µl of each solution. After development, dry the plate at 105° for 15 minutes and examine in ultraviolet light at 254 nm. Any spot corresponding to 1-phenyl-3-pyrrolidinopropan-1-one in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.2 per cent). Spray the plate with *dilute potassium iodobismuthate solution*. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any spot due to excipients on the line of application.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 2.5 mg of Procyclidine Hydrochloride, transfer to a 100-ml volumetric flask, add 10.0 ml of *water* and mix, and dilute to volume with a 0.025 per cent w/v solution of *bromocresol purple* in 2 per cent v/v solution of *glacial acetic acid*. Allow the undissolved particles to settle. Transfer 5.0 ml of the supernatant solution to a separating funnel, extract with 20.0 ml of *chloroform* and filter the extract, discarding the first 5 ml of the filtrate. Measure the absorbance of the filtrate at the maximum at about 405 nm (2.4.7), using as the blank a solution prepared by treating 0.5 ml of *water* and 4.5 ml of a 0.025 per cent w/v solution of *bromocresol purple* in the same manner beginning at the words "extract with 20 ml of *chloroform* .....".

Calculate the content of $C_{19}H_{29}NO,HCl$ from the absorbance obtained by repeating the operation using *procyclidine hydrochloride RS* in place of the powdered tablets.

Storage. Store protected from moisture.

Progesterone Injectable Suspension

Progesterone Injectable Suspension is a sterile suspension of Progesterone in Water for Injections.

Progesterone Injectable Suspension contains not less than 93.0 per cent and not more than 107.0 per cent of the stated amount of progesterone, $C_{21}H_{30}O_2$.

Usual Strengths. 25 mg per ml; 50 mg per ml; 100 mg per ml; 200 mg per ml.

Identification

A. Filter a volume of suspension containing about 100 mg of progesterone, through a medium-porosity, sintered-glass crucible, filter again if the fluid is not clear. Wash with several 5.0 ml portions of *water*, evaporate on a steam bath, dry the residue at 105°. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *progesterone RS* or with the reference spectrum of progesterone.

B. Melting point (2.4.21). 126° to 131°.

Tests

pH (2.4.24). 4.0 to 7.5.

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 85 volumes of *ethanol (95 per cent)* and 15 volumes of *water*.

Internal standard solution. A 0.66 per cent w/v solution of *methyltestosterone RS* in the solvent mixture.

Test solution. Shake a volume of suspension containing about 25 mg of progesterone with 16 ml of the solvent mixture into a polytef-lined, screw-capped, 25 ml test tube until the solution

is clear. Add 2.0 ml of the internal standard solution and dilute to 25 ml with the solvent mixture.

Reference solution. A 0.25 per cent w/v solution of *progesterone RS* in the solvent mixture. To 4.0 ml of this solution, add 2.0 ml of the internal standard solution and dilute to 10 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 100 cm x 2.1 mm, packed with octadecylsilane chemically bonded to porous silica (30-50 µm),
- mobile phase: a mixture of 72 volumes of *water* and 28 volumes of *isopropyl alcohol*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 5 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to progesterone and methyltestosterone is not less than 3.5 and the relative standard deviation for replicate injections is not more than 1.5 per cent.

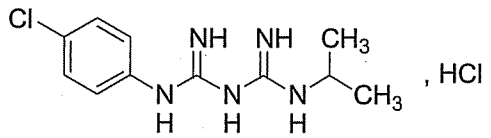
Inject the test solution and the reference solution.

Calculate the content of $C_{21}H_{30}O_2$ in the suspension.

Storage. Store in single dose or multiple dose containers, preferably of Type 1 glass.

Proguanil Hydrochloride

Chloroguanide Hydrochloride



$C_{11}H_{16}ClN_5, HCl$ Mol. Wt. 290.2

Proguanil Hydrochloride is 1-(4-chlorophenyl)-5-isopropylbiguanide hydrochloride.

Proguanil Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{11}H_{16}ClN_5, HCl$, calculated on the dried basis.

Category. Antimalarial.

Dose. Suppressive, 100 to 300 mg daily.

Description. A white, crystalline powder; odourless.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *proguanil hydrochloride RS* or with the reference spectrum of proguanil hydrochloride.

B. To 10 ml of a saturated solution add 0.25 ml of *potassium ferrocyanide solution*; a white precipitate is produced which dissolves on addition of a few drops of *dilute nitric acid.*

C. Dissolve 5 mg in 5 ml of a warm 1.0 per cent w/v solution of *cetrimide* and add 1 ml of *5 M sodium hydroxide* and 1 ml of *bromine solution*; a deep red colour is produced.

D. Gives the reactions of chlorides (2.3.1).

Tests

Acidity or alkalinity. To 35 ml of *water* maintained at 60° to 65° add 0.2 ml of *methyl red solution*, neutralise with *0.01 M sodium hydroxide* or *0.01 M hydrochloric acid*, add 0.4 g of the substance under examination and stir until dissolved. The resulting solution is not acidic and requires for neutralisation not more than 0.2 ml of *0.01 M hydrochloric acid.*

4-Chloroaniline. Dissolve 0.1 g in 1 ml of *2 M hydrochloric acid*, add sufficient *water* to produce 20 ml, cool to 5°, add 1 ml of *0.05 M sodium nitrite*, allow to stand at 5° for 5 minutes, add 2 ml of a 5 per cent w/v solution of *ammonium sulphamate* and allow to stand for 10 minutes. Add 2 ml of a 0.1 per cent w/v solution of *N-(1-naphthyl)ethylenediamine dihydrochloride*, dilute to 50 ml with *water* and allow to stand for 30 minutes. Any magenta colour produced is not more intense than that obtained by treating in the same manner and at the same time 20 ml of a solution containing 1.25 µg of *4-chloroaniline.*

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.15 g, dissolve in 25 ml of *anhydrous glacial acetic acid* and 10 ml of *mercuric acetate solution.* Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01451 g of $C_{11}H_{16}ClN_5, HCl$.

Storage. Store protected from light and moisture.

Proguanil Tablets

Proguanil Hydrochloride Tablets; Chloroguanide Hydrochloride Tablets

Proguanil Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of proguanil hydrochloride, $C_{11}H_{16}ClN_5, HCl$.

Usual strength. 100 mg.

Identification

A. Boil a quantity of the powdered tablets containing 0.5 g of Proguanil Hydrochloride with 5 ml of *dilute hydrochloric acid*, cool and filter. To the filtrate add a slight excess of *sodium hydroxide solution*, extract with 30 ml of *ether* and evaporate the ethereal extract; the residue, after drying at 105°, melts at about 131° (2.4.21).

Dissolve the residue obtained in test A in the minimum quantity of *dilute hydrochloric acid*; the solution diluted with *water* to about 40 ml and neutralised if necessary, with cautious addition of *dilute ammonia solution*, complies with the following tests.

B. To 10 ml add 0.25 ml of *potassium ferrocyanide solution*; a white precipitate is produced which dissolves on addition of a few drops of *dilute nitric acid*.

C. To 0.5 ml add 5 ml of a warm 1.0 per cent w/v solution of *cetrimide* and add 1 ml of *5 M sodium hydroxide* and 1 ml of *bromine solution*; a deep red colour is produced.

Tests

4-Chloroaniline. To a quantity of the powdered tablets containing about 0.1 g of Proguanil Hydrochloride add 5 ml of *ethanol (95 per cent)* and shake for 10 minutes. Add 2.5 ml of *2 M hydrochloric acid* and 15 ml of *water*, mix and filter through a wetted filter paper, washing the filter with 5 ml of *water*. Cool to 5°, add 1 ml of *0.05 M sodium nitrite*, allow to stand at 5° for 5 minutes, add 2 ml of a 5 per cent w/v solution of *ammonium sulphamate* and allow to stand for 10 minutes. Add 2 ml of a 0.1 per cent w/v solution of *N-(1-naphthyl)ethylenediamine dihydrochloride*, dilute to 50 ml with *water* and allow to stand for 30 minutes. Any magenta colour produced is not more intense than that obtained by treating in the same manner and at the same time 20 ml of a solution containing 1.25 µg of *4-chloroaniline*.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 0.1 g of Proguanil Hydrochloride, add 5 ml of *water* and warm on a water-bath with stirring until a smooth paste is obtained. Add 50 ml of *water*, continue warming for 10 minutes, cool, add sufficient *water* to produce 100.0 ml and filter. Dilute 10.0 ml of the filtrate to 100.0 ml with *water* and to 10.0 ml of the resulting solution add 70 ml of *water*, 5 ml of a 20 per cent w/v solution of *cetrimide* and 1 ml of *2-propanol*. Adjust the temperature of the solution to 20° and add 2 ml of *alkaline sodium hypobromite solution* and sufficient *water* to produce 100.0 ml. Allow to stand at 20° for 25 minutes and measure the absorbance of the resulting solution at the maximum at about 480 nm (2.4.7).

Calculate the content of $C_{11}H_{16}ClN_5$,HCl from the absorbance obtained by repeating the operation using 10 ml of a 0.01 per cent w/v solution of *proguanil hydrochloride RS* beginning at the words "add 70 ml of *water*,....".

Storage. Store protected from light and moisture.

Promazine Tablets

Promazine Hydrochloride Tablets

Promazine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of promazine hydrochloride, $C_{17}H_{20}N_2S$,HCl.

Usual strengths. 25 mg; 50 mg; 100 mg.

Identification

A. To a quantity of the powdered tablets containing 40 mg of Promazine Hydrochloride, add 10 ml of *water* and 2 ml of *1 M sodium hydroxide*, shake and extract with 15 ml of *ether*. Wash the extract with 5 ml of *water*, dry with *anhydrous sodium sulphate*, evaporate to dryness and dissolve the residue in 0.4 ml of *chloroform*. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *promazine hydrochloride RS* or with the reference spectrum of promazine hydrochloride.

B. To a quantity of the powdered tablets containing 5 mg of Promazine Hydrochloride, add 5 ml of *sulphuric acid* and allow to stand for 5 minutes. An orange colour is produced.

C. Triturate a quantity of the powdered tablets containing 0.2 g of Promazine Hydrochloride with 4 ml of *methanol*, centrifuge, filter the supernatant liquid, heat almost to boiling, immediately add 2 ml of a boiling 3.5 per cent w/v solution of *picric acid* in *methanol* and boil for 2 minutes. Cool in ice, filter, wash the crystals with three quantities of *methanol*, dissolve in 10 ml of hot *methanol* and repeat the crystallisation and washing. The rust red crystals so obtained, after drying at 105° for 1 hour, melts at about 144° (2.4.21).

Tests

Related substances. Comply with the test for Related substances in Phenothiazines (2.3.5), using mobile phase (a) and the following freshly prepared solutions.

Test solution. Extract a quantity of the powdered tablets containing 0.1 g of Promazine Hydrochloride with 10 ml of *methanol* and filter.

Reference solution. Dilute 1 ml of test solution to 200 ml with *methanol*.

Other tests. Comply with the tests stated under Tablets.

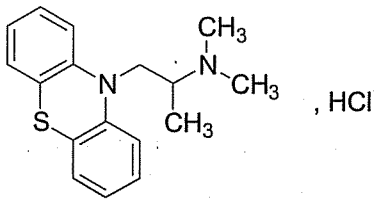
Assay.

NOTE—Carry out the test protected from light.

Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 50 mg of Promazine Hydrochloride and triturate with 10 ml of *2 M hydrochloric acid* and add 200 ml of *water*. Shake for 15 minutes, add sufficient *water* to produce 500 ml and centrifuge about 50 ml of the mixture. To 5 ml of the clear, supernatant liquid add 10 ml of *0.1 M hydrochloric acid* and sufficient *water* to produce 100 ml. Measure the absorbance (2.4.7) of the resulting solution at the maximum at about 251 nm.

Calculate the content of $C_{17}H_{20}N_2S,HCl$ taking 935 as the specific absorbance at 251 nm.

Promethazine Hydrochloride



$C_{17}H_{20}N_2S,HCl$ Mol. Wt. 320.9

Promethazine Hydrochloride is (*RS*)-dimethyl(2-phenothiazin-10-ylpropyl)amine hydrochloride.

Promethazine Hydrochloride contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{17}H_{20}N_2S$, HCl, calculated on the dried basis.

Category. Antiemetic.

Dose. 20 to 50 mg daily, in single or divided doses.

Description. A white or faintly yellowish, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *promethazine hydrochloride RS* or with the reference spectrum of promethazine hydrochloride.

B. Complies with the test for Identification of Phenothiazines (2.3.3).

C. Dissolve 0.1 g in 3 ml of *water* and add 1 ml of *nitric acid* dropwise; a precipitate is produced which dissolves rapidly to give a red solution which becomes orange and then yellow. Heat the solution to boiling; it becomes orange and an orange-red precipitate is produced.

D. Gives reaction B of chlorides (2.3.1).

Tests

pH (2.4.24). 4.0 to 5.0, determined in a 10.0 per cent w/v solution prepared immediately before use.

Related substances. Carry out the test for Related substances in Phenothiazines (2.3.5), protected from bright light using mobile phase B.

Prepare the following solutions immediately before use.

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of a mixture of 95 volumes of *methanol* and 5 volumes of *diethylamine.*

Reference solution (a). A 0.01 per cent w/v solution of the substance under examination in the same solvent mixture.

Reference solution (b). A 0.02 per cent w/v solution of *isopromethazine hydrochloride RS* in the same solvent mixture.

Apply to the plate 10 µl of each solution.

Any spot corresponding to isopromethazine in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b) and any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (a).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.25 g, dissolve in a mixture of 5 ml of *0.01 M hydrochloric acid* and 50 ml of *ethanol (95 per cent)* and titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Record the volume added between the two inflections.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.03209 g of $C_{17}H_{20}N_2S,HCl$.

Storage. Store protected from light and moisture.

Promethazine Injection

Promethazine Hydrochloride Injection

Promethazine Injection is a sterile solution of Promethazine Hydrochloride in Water for Injections free from dissolved air. It may contain suitable stabilising agents.

Promethazine Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of promethazine hydrochloride, $C_{17}H_{20}N_2S$, HCl.

Usual strengths. 25 mg in 1 ml; 50 mg in 2 ml.

Identification

A. To a volume containing 0.1 g of Promethazine Hydrochloride add 20 ml of *water* and 2 ml of *10 M sodium hydroxide*. Shake and extract the mixture with 25 ml of *ether*. Wash the ether layer with two quantities, each of 5 ml, of *water*, dry with *anhydrous sodium sulphate* and evaporate to dryness. Dissolve the residue in 1 ml of *chloroform*.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *promethazine hydrochloride RS* treated in the same manner or with the reference spectrum of promethazine.

B. To a volume containing 0.2 g of Promethazine Hydrochloride add sufficient *potassium carbonate* to saturate the solution, extract with two quantities, each of 10 ml, of *ether* and evaporate the combined extracts to dryness. Dissolve the residue in 2 ml of *methanol* and pour into a solution of 0.4 g of *picric acid* in 10 ml of *methanol*, previously warmed to about 50°. Cool, scratch the sides of the tube to induce crystallisation, allow to stand for 3 to 4 hours and filter. The residue, after washing with *methanol* and drying, melts at about 160° (2.4.21).

C. To a volume containing 5 mg of Promethazine Hydrochloride add carefully 2 ml of *sulphuric acid* and allow to stand for 5 minutes; a red colour is produced.

Tests

pH (2.4.24). 5.0 to 6.0.

Related substances. Carry out the test for Related substances in Phenothiazines (2.3.5), using mobile phase B.

Test solution. Dilute a volume of the injection with a mixture of 95 volumes of *methanol* and 5 volumes of *diethylamine* to contain 1 per cent w/v of Promethazine Hydrochloride.

Reference solution (a). Dilute 1 volume of the test solution to 40 volumes with the same solvent mixture.

Reference solution (b). Dilute 1 volume of the test solution to 200 volumes with the same solvent mixture.

Reference solution (c). A 0.01 per cent w/v solution of *isopromethazine hydrochloride RS* in the same solvent mixture.

Apply separately to the plate 10 µl of each solution.

Any spot corresponding to isopromethazine in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (c). Any other secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. *Carry out the following procedure protected from light.*

To an accurately measured volume containing about 25 mg of Promethazine Hydrochloride add sufficient *0.01 M hydrochloric acid* to produce 100.0 ml. Dilute 10.0 ml to 100.0 ml with *0.01 M hydrochloric acid*, dilute 10.0 ml of this solution to 50.0 ml with *0.01 M hydrochloric acid* and measure the absorbance of the resulting solution at the maximum at about 249 nm (2.4.7). Calculate the content of $C_{17}H_{20}N_2S$, HCl taking 910 as the specific absorbance at 249 nm.

Storage. Store protected from light.

Promethazine Syrup

Promethazine Hydrochloride Syrup; Promethazine Hydrochloride Oral Solution; Promethazine Oral Solution

Promethazine Syrup is a solution containing Promethazine Hydrochloride in a suitable flavoured vehicle.

Promethazine Syrup contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of promethazine hydrochloride, $C_{17}H_{20}N_2S$, HCl.

Usual strength. 5 mg per 5 ml.

Identification

Carry out the method for identification of phenothiazines (2.3.3).

Test solution. A solution prepared by diluting a suitable volume of the syrup with *water* to contain 0.08 per cent w/v of Promethazine Hydrochloride. Apply 5 µl to the plate.

Tests

Other tests. Complies with the tests stated under Oral Liquids.

Assay. *Carry out the following procedure protected from light.*

Weigh accurately a quantity containing about 10 mg of Promethazine Hydrochloride, add 25 ml of *water* and 5 ml of a 5 per cent w/v solution of *sodium hydroxide*. Extract the mixture with two quantities, each of 50 ml, of *chloroform*, shaking vigorously for 1 minute each time, evaporate the combined extracts to dryness at about 30° at a pressure of

2 kPa and dissolve the residue in sufficient *0.1 M hydrochloric acid* to produce 50.0 ml (solution A). Dilute 10 ml of solution A to 50.0 ml with *water* (solution B). To a further 10 ml of solution A add 5 ml of *peroxyacetic acid solution*, allow to stand for 10 minutes and add sufficient *water* to produce 50.0 ml (solution C). Measure the absorbance of solution C at the maximum at about 336 nm (2.4.7), using solution B as the blank and measure the absorbance of solution B at the same wavelength using *water* as the blank. Repeat the procedure using a 0.02 per cent w/v solution of *promethazine hydrochloride RS* in *0.1 M hydrochloric acid* in place of solution A and beginning at the words "Dilute 10 ml of.....".

Determine the weight per ml of the syrup (2.4.29), and calculate the content of $C_{17}H_{20}N_2S$, HCl, weight in volume. The result is not valid unless the absorbance of solution B is less than 0.10.

Storage. Store protected from light and moisture.

Promethazine Tablets

Promethazine Hydrochloride Tablets

Promethazine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of promethazine hydrochloride, $C_{17}H_{20}N_2S$, HCl. The tablets are coated.

Usual strengths. 10 mg; 25 mg; 50 mg.

Identification

A. To a quantity of the powdered tablets containing 40 mg of Promethazine Hydrochloride add 10 ml of *water* and 2 ml of *1 M sodium hydroxide*, shake and extract with 15 ml of *ether*. Wash the ether extract with 5 ml of *water*, dry with *anhydrous sodium sulphate*, evaporate to dryness and dissolve the residue in 0.4 ml of *chloroform*.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *promethazine hydrochloride RS* treated in the same manner or with the reference spectrum of promethazine.

B. Dissolve a quantity of the powdered tablets containing 0.2 g of Promethazine Hydrochloride in 2 ml of *water*, filter, add sufficient *potassium carbonate* to saturate the solution, extract with two quantities, each of 10 ml, of *ether* and evaporate the combined extracts to dryness. Dissolve the residue in 2 ml of *methanol* and pour into a solution of 0.4 g of *picric acid* in 10 ml of *methanol*, previously warmed to about 50°. Cool, scratch the sides of the tube to induce crystallisation, allow to stand for 3 to 4 hours and filter. The residue, after washing with *methanol* and drying, melts at about 160° (2.4.21).

C. To a quantity of the powdered tablets containing 5 mg of Promethazine Hydrochloride add 5 ml of *sulphuric acid* and allow to stand for 5 minutes; a red colour is produced.

Tests

Related substances. Carry out the test for Related substances in Phenothiazines (2.3.5), using mobile phase B.

Test solution. A solution freshly prepared by extracting a quantity of the powdered tablets containing 0.1 g of Promethazine Hydrochloride with 10 ml of a mixture of 95 volumes of *methanol* and 5 volumes of *diethylamine* and filtering.

Reference solution (a). Dilute 1.0 ml of the test solution to 40 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 200.0 ml with the same solvent.

Reference solution (c). A 0.01 per cent w/v solution of *isopromethazine hydrochloride RS* in the same solvent.

Apply to the plate 10 µl of each solution. Any spot corresponding to isopromethazine in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (c). Any other secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

Uniformity of content. *(For tablets containing 10 mg or less)* — Comply with the test stated under Tablets.

Crush one tablet, add 1 ml of *dilute hydrochloric acid* and 30 ml of *water* and shake for 15 minutes. Add sufficient *water* to produce 50.0 ml and centrifuge. Complete the procedure described in the Assay beginning at the words "To 5.0 ml of the clear supernatant liquid....".

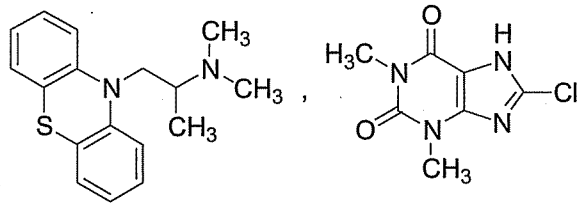
Other tests. Comply with the tests stated under Tablets.

Assay. *Carry out the following procedure protected from light.*

Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 50 mg of Promethazine Hydrochloride with 10 ml of *2 M hydrochloric acid* and add 200 ml of *water*. Shake for 15 minutes, add sufficient *water* to produce 500.0 ml and centrifuge about 50 ml of the mixture. To 5.0 ml of the clear supernatant liquid add 10 ml of *0.1 M hydrochloric acid* and sufficient *water* to produce 100.0 ml. Measure the absorbance of the resulting solution at the maximum at about 249 nm (2.4.7). Calculate the content of $C_{17}H_{20}N_2S$, HCl taking 910 as the specific absorbance at 249 nm.

Storage. Store protected from light and moisture.

Promethazine Theoclate



$C_{17}H_{20}N_2S,C_7H_7ClN_4O_2$ Mol. Wt. 499.0

Promethazine Theoclate is the (*RS*)-dimethyl(2-phenothiazin-10-ylpropyl)amine salt of 8-chlorotheophylline.

Promethazine Theoclate contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{17}H_{20}N_2S$, $C_7H_7ClN_4O_2$, calculated on the dried basis.

Category. Antiemetic.

Dose. 25 to 50 mg daily, in single or divided doses.

Description. A white or almost white powder; odourless or almost odourless.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B, C and D may be omitted if tests A and E are carried out.

A. Shake 0.15 g with 2.5 ml of *water*, add 1 ml of *5 M ammonia* and extract with 30 ml of *ether*. Wash the ether extract with 10 ml of *water*, dry with *anhydrous sodium sulphate* and evaporate to dryness. Dissolve the residue in 1 ml of *chloroform*.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *promethazine RS* or with the reference spectrum of promethazine.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.0007 per cent w/v solution in *ethanol* containing 0.01 per cent v/v of *strong ammonia solution* shows an absorption maximum at about 255 nm; absorbance is about 0.53.

C. Dissolve 5 mg in 2 ml of *sulphuric acid* and allow to stand for 5 minutes; a red colour is produced.

D. Shake 0.4 g with 10 ml of *water*, add 4 ml of *5 M ammonia*, shake with two quantities, each of 30 ml, of *ether* and add 4 ml of *hydrochloric acid* to the aqueous solution; a white precipitate is produced. Filter, wash with *water* and dry at 105°. Dissolve 10 mg of the residue in 1 ml of *hydrochloric acid*, add 0.1 g of *potassium chlorate* and evaporate to dryness; a reddish residue remains which becomes purple on exposure to the vapour of ammonia.

E. Fuse 50 mg of the residue obtained in test D with 0.5 g of *anhydrous sodium carbonate*, boil the residue with 5 ml of *water*, acidify to *litmus paper* with *nitric acid* and filter. The filtrate gives reaction A of chlorides (2.3.1).

Tests

Chlorides (2.3.12). Shake 1.5 g with 50 ml of *water* for 2 minutes and filter. 25 ml of the filtrate complies with the limit test for chlorides (330 ppm).

Related substances. Carry out the test for Related substances in Phenothiazines (2.3.5), protected from bright light, using mobile phase B.

NOTE-Prepare the following solutions immediately before use.

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of a mixture of 95 volumes of *methanol* and 5 volumes of *diethylamine*.

Reference solution (a). A 0.01 per cent w/v solution of the substance under examination in the same solvent mixture.

Reference solution (b). A 0.02 per cent w/v solution of *isopromethazine hydrochloride RS* in the same solvent mixture.

Apply to the plate 10 µl of each solution. Any spot corresponding to isopromethazine in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b) and any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (a).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 1.0 g and dissolve in 200 ml of *acetone*. Titrate with *0.1 M perchloric acid*, using 3 ml of a saturated solution of *methyl orange* in *acetone* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.04990 g of $C_{17}H_{20}N_2S,C_7H_7ClN_4O_2$.

Storage. Store protected from light and moisture.

Promethazine Theoclate Tablets

Promethazine Theoclate Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of promethazine theoclate, $C_{17}H_{20}N_2S$, $C_7H_7ClN_4O_2$.

Usual strengths. 25 mg; 50 mg.

Identification

A. To a quantity of the powdered tablets containing 40 mg of Promethazine Theoclate add 10 ml of *water* and 2 ml of *1 M sodium hydroxide*, shake and extract with 15 ml of *ether*. Wash the ether extract with 5 ml of *water*, dry with *anhydrous sodium sulphate*, evaporate to dryness and dissolve the residue in 0.4 ml of *chloroform*.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *promethazine theoclate RS* treated in the same manner or with the reference spectrum of promethazine.

B. Dissolve a quantity of the powdered tablets containing 0.2 g of Promethazine Theoclate in 2 ml of *water*, filter, add sufficient *potassium carbonate* to saturate the solution, extract with two quantities, each of 10 ml, of *ether* and evaporate the combined extracts to dryness. Dissolve the residue in 2 ml of *methanol* and pour into a solution of 0.4 g of *picric acid* in 10 ml of *methanol*, previously warmed to about 50°. Cool, scratch the sides of the tube to induce crystallisation, allow to stand for 3 to 4 hours and filter. The residue, after washing with *methanol* and drying, melts at about 160° (2.4.21).

C. To a quantity of the powdered tablets containing 5 mg of Promethazine Theoclate add 5 ml of *sulphuric acid* and allow to stand for 5 minutes; a red colour is produced.

D. Extract a quantity of the powdered tablets containing 0.2 g of Promethazine Theoclate with *chloroform*, filter and evaporate the filtrate to dryness. Shake the residue with 10 ml of *water*, add 4 ml of *5 M ammonia* and extract with two quantities, each of 30 ml, of *ether*. Wash the combined extracts with 10 ml of *water*. Combine the aqueous layer and washings, add 4 ml of *hydrochloric acid*; a white precipitate is produced. Filter, wash the residue with *water* and dry at 105°. Dissolve 10 mg of the residue in 1 ml of *hydrochloric acid*, add 0.1 g of *potassium chlorate* and evaporate to dryness; a reddish residue remains which becomes purple on exposure to the vapour of ammonia.

Tests

Related substances. Carry out the test for related substances in phenothiazines (2.3.5), using mobile phase B.

Test solution. A solution freshly prepared by extracting a quantity of the powdered tablets containing 0.1 g of Promethazine Theoclate with 10 ml of a mixture of 95 volumes of *methanol* and 5 volumes of *diethylamine* and filtering.

Reference solution (a). Dilute 1 volume of the test solution to 40 volumes with the same solvent mixture.

Reference solution (b). Dilute 1 volume of the test solution to 200 volumes with the same solvent mixture.

Reference solution (c). A 0.01 per cent w/v solution of *isopromethazine hydrochloride RS* in the same solvent mixture.

Apply to the plate 10 µl of each solution. Any spot corresponding to isopromethazine in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (c). Any other secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a) and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b).

Other tests. Comply with the tests stated under Tablets.

Assay. *Carry out the following procedure protected from light.*

Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 50 mg of Promethazine Theoclate, add 5 ml of *water* and 1 ml of *strong ammonia solution* and allow to stand for 5 minutes. Add 50 ml of *ethanol*, shake for 5 minutes and filter, washing the residue with five quantities, each of 5 ml, of *ethanol*. Add sufficient *ethanol* to the filtrate to produce 100.0 ml. Dilute 10.0 ml to 100.0 ml with *ethanol* and dilute 10.0 ml of this solution to 100.0 ml with *ethanol*. Measure the absorbance of the resulting solution at the maximum at about 255 nm (2.4.7). Calculate the content of $C_{17}H_{20}N_2S$, $C_7H_7ClN_4O_2$ taking 755 as the specific absorbance at 255 nm.

Storage. Store protected from light and moisture.

Propane

C_3H_8 Mol. Wt. 44.1

Propane is dimethylmethane.

Propane contains not less than 98.0 per cent of C_3H_8.

CAUTION—Propane is highly flammable and explosive.

Identification

Determine by infrared absorption spectrophotometry (2.4.6), the solution give maxima at the wavelength of 3.4 µm, 6.8 µm and 7.2 µm.

Tests

Water (2.3.43). Not more than 0.001 per cent with the following modifications (a) provide the closed-system titrating vessel with an opening through which passes a coarse-porosity gas

dispersion tube connected to a sample cylinder; (b) dilute the reagent with *anhydrous methanol* to give a water equivalence factor of between 0.2 and 1.0 mg per ml, age this diluted solution for not less than 16 hours before sanitation; (c) obtain a 100 g sample as directed under inhalation preparation, and introduce the sample into the titration vessel through the gas dispersion tube at a rate of about 100 ml of gas per minute.

High-boiling residues. Not more than 5 µg per ml, determined by the following method. Prepare a cooling coil from copper tubing (about 6 mm outside diameter × about 6.1 m long) to fit into a vacuum-jacketed flask. Immerse the cooling coil in a mixture of dry ice and *acetone* in a vacuum-jacketed flask, and connect one end of the tubing to the propellant sample cylinder. Carefully open the sample cylinder valve, flush the cooling coil with about 50 ml of the propellant, and discard this portion of liquefied propellant. Continue delivering liquefied propellant from the cooling coil, and collect it in a previously chilled 1000-ml sedimentation cone until the cone is filled to the 1000-ml mark. Allow the propellant to evaporate, using a warm water bath maintained at about 40° to reduce evaporating time. When all of the liquid has evaporated, rinse the sedimentation cone with two 50-ml portions of *pentane*, and combine the rinsings in a tared 150-ml evaporating dish. Transfer 100 ml of the *pentane* solvent to a second tared 150-ml evaporating dish, place both evaporating dishes on a water bath, evaporate to dryness, and heat the dishes in an oven at 100° for 60 minutes. Cool the dishes in a desiccator, and weigh. Repeat the heating for 15-minute periods until successive weighings are within 0.1 mg, and calculate the weight of the residue obtained from the propellant as the difference between the weights of the residues in the two evaporating dishes.

Acidity of residue. Add 10 ml of *water* to the residue obtained in the test for High boiling residues, mix by swirling for about 30 seconds, add 2 drops of *methyl orange solution*, insert the stopper in the tube, and shake vigorously; no pink or red color appears in the aqueous layer.

Sulphur. Carefully open the container valve to produce a moderate flow of gas. Do not direct the gas stream toward the face, but deflect a portion of the stream toward the nose, the odour free from the characteristic odour of sulphur compounds.

Assay. Determine by Gas chromatography (2.4.13).

Test solution. Connect 1 Propane cylinder to the chromatograph through a suitable sampling valve and a flow control valve downstream from the sampling valve. Flush the liquid sample through the sampling valve, taking care to avoid entrapment of gas or air in the sampling valve.

Chromatographic system

- an aluminum column 6 m x 3 mm, packed with 10 per cent of liquid phase G30 (Tetraethylene glycol dimethyle ether) on non-acid-washed support S1C (A support prepared from crushed firebrick and calcined or burned with a clay binder above 900° with subsequent acid-wash. It may be silanized),
- a thermal-conductivity detector,
- flow rate. 50 ml per minute using nitrogen as carrier gas.

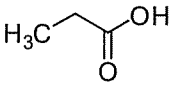
Inject the test solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 1.0.

Inject 2 µl of test solution.

Calculate the percentage purity by dividing 100 times the propane response by the sum of all of the responses in the chromatogram.

Storage. Store protected from moisture and prevent exposure to excessive heat.

Propionic Acid



$C_3H_6O_2$ Mol. Wt. 74.1

Propionic Acid contains not less than 99.5 per cent and not more than 100.5 per cent of $C_3H_6O_2$.

Tests

Weight per ml (2.4.29). 0.988 to 0.993.

Distilling range (2.4.8). 138.5° to 142.5°.

Heavy metals (2.3.13). To the residue obtained in the test for Nonvolatile residue, add 8 ml of *0.1 M hydrochloric acid*, warm gently until solution is complete, dilute with *water* to 100 ml. 10 ml of the solution complies with the limit test for heavy metals, Method D (10 ppm).

Limit of nonvolatile residue. Evaporate 20 g in a tared dish, and dry at 105° for 1 hour, the weight of the residue does not exceed 2 mg.

Readily oxidizable substances. Dissolve 15 g of *sodium hydroxide* in 50 ml of *water*, cool, add 6 ml of *bromine*, stirring to effect complete solution, and dilute with *water* to 2000 ml. Transfer 25.0 ml of this solution to a glass-stoppered, 250-ml conical flask containing 100 ml of *water*, and add 10 ml of 20.0 per cent w/v solution *sodium acetate* and 10.0 ml of *Propionic Acid*. Allow to stand for 15 minutes, add 5 ml of 25.0 per cent w/v solution of *potassium iodide* and 10 ml of *hydrochloric acid*, and titrate with *0.1 M sodium thiosulphate* just to the disappearance of the brown color. Carry out a blank titration. The difference between the volume of *0.1 M sodium thiosulphate* required for the blank and that required for the test solution is not more than 2.2 ml.

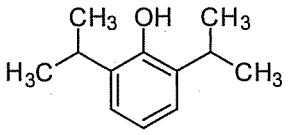
Aldehydes. Transfer 10.0 ml to a glass-stoppered, 250-ml conical flask containing 50 ml of *water* and 10.0 ml of 1.25 per cent w/v solution of *sodium bisulphite*, insert the stopper, and shake vigorously. Allow the mixture to stand for 30 minutes, then titrate with *0.1 M iodine* to the same brownish yellow endpoint obtained with a blank treated with the same quantities of the same reagents. The difference between the volume of *0.1 M iodine* required for the blank and that required for the test solution is not more than 1.75 ml.

Assay. Weigh accurately about 1.5 g and dissolve with 100 ml of recently boiled and cooled *water* in a 250-ml conical flask, and titrate with *0.5 M sodium hydroxide* using *dilute phenolphthalein solution* as indicator .

1 ml of *0.5 M sodium hydroxide* is equivalent to 0.03704 g of $C_3H_6O_2$.

Storage. Store protected from moisture.

Propofol



$C_{12}H_{18}O$ Mol. Wt. 178.3

Propofol is 2,6-diisopropylphenol.

Propofol contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{12}H_{18}O$.

Category. General anaesthetic.

Description. A colourless or very light yellow, clear liquid.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *propofol RS* or with the reference spectrum of propofol.

Tests

Refractive index (2.4.27). 1.5125 to 1.5145.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution (a). Dissolve 1.0 g of the substance under examination in 10 ml of *hexane*.

Test solution (b). Dissolve 0.24 g of the substance under examination in 100 ml of *hexane*.

Reference solution (a). A solution containing 5 mg of the substance under examination and 15 µl containing 15 mg of *2,6-bis(1-methylethyl)benzene-1,4-dione RS (propofol impurity J RS)* in 50 ml of *hexane*.

Reference solution (b). Dilute 0.1 ml of *propofol for peak identification RS* (containing 3,3',5,5'-tetrakis(1-methylethyl)biphenyl-4,4'-diol (propofol impurities E) and 2-(1-methylethoxy)-1,3-bis(1-methylethyl)benzene (propofol impurities G) to 1.0 ml with *hexane*.

Reference solution (c). Dilute 1.0 ml of test solution (a) to 100 ml with *hexane*. Dilute 1.0 ml of this solution to 10 ml with *hexane*.

Reference solution (d). A 0.24 per cent w/v solution of *propofol RS* in *hexane*.

Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with silica gel (5 µm),
- mobile phase: a mixture of 1 volume of *anhydrous ethanol*, 7.5 volumes of *acetonitrile* and 990 volumes of *hexane*,
- flow rate. 2 ml per minute,
- spectrophotometer set at 275 nm,
- injection volume. 10 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to propofol impurity J and propofol is not less than 4.0. The relative retention times with reference to propofol for propofol impurity G is about 0.5, for oxydibenzene (propofol impurity G) is about 0.6, for 2-(1-methylethenyl)-6-(1-methylethyl)phenol (propofol impurity B) is about 0.7, for 4-hydroxy-3,5-bis(1-methylethyl)benzoic acid (propofol impurity F) is about 2.3, for 2,5-bis(1-methylethyl)phenol (propofol impurity D) is about 2.5 , for 1-methylethyl 4-hydroxy-3,5-bis(1-methylethyl)benzoate (propofol impurity P) is about 2.9, for 2,4-bis(1-methylethyl)phenol (propofol impurity A) is about 3.0, for 2-(1-methylethyl)phenol (propofol impurity C) is about 3.4, for propofol impurity E is about 4.0, for 3-(1-methylethyl)phenol (propofol impurity F) is about 5.8 and for 4-(1-methylethyl)phenol (propofol impurity H) is about 6.4.

Inject test solution (a), reference solution (a), (b) and (c). Run the chromatogram 7 times the retention time of the principal peak. In the chromatogram obtained with test solution (a), the area of peak due to propofol impurity G is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent); the area of the peak due to propofol impurity E is not more than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.01 per cent). The area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent). The sum of the areas of all the secondary peaks is not more than 3 times the area of the

principal peak in the chromatogram obtained with reference solution (c) (0.3 per cent). Ignore any peak other than propofol impurity E with an area less than 0.3 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.03 per cent).

Impurities J, K, L and O. Determine by gas chromatography (2.4.13).

Test solution. Dissolve 40 mg of the substance under examination in 10 ml of *dichloromethane.*

Reference solution (a). Dilute 1.0 ml of the test solution to 100 ml with *dichloromethane.* Further dilute 1.0 ml of this solution to 10 ml with *dichloromethane.*

Reference solution (b). Dilute 5 µl containing 5 mg of *propofol impurity J RS* to 100 ml with *dichloromethane.* Dilute 1.0 ml of this solution to 25 ml with *dichloromethane.*

Reference solution (c). Dissolve 4 mg of *propofol RS* in 1.0 ml of reference solution (b).

Chromatographic system
- a fused-silica capillary column 30 m x 0.32 mm, coated with polymethylphenylsiloxane (0.5 µm),
- temperature:
  Column 80° from 0-3 minutes, 80°-120° from 3-25 minutes and 210° from 25-40 minutes,
  Injection port at 100° and detector at 270°,
- a flame ionisation detector,
- flow rate. 1.7 ml per minute using nitrogen as carrier gas.

Inject 1 µl of reference solution (c). The test is not valid unless the peak- to- valley ratio is not less than 3.0 where H_p is the height above the baseline of the peak due to propofol impurity J and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to propofol. The relative retention time with reference to propofol for 1-(1-methylethoxy)-2-(1-methylethyl)benzene (propofol impurity K) is about 0.76, for 2,2-dimethyl-4-(1-methylethyl)-1,3-benzodioxole (propofol impurity L) is about 0.81 , for propofol impurity J is about 1.01 and for 2-(1-methylethyl)-6-propylphenol (propofol impurity O) is about 1.03.

Inject 1 µl of the test solution, reference solution (a) and (c). In the chromatogram obtained with the test solution the area of the peak due to propofol impurities J, K, L and O, for each impurity, is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances.

Inject test solution (b) and reference solution (d).

Calculate the content of $C_{12}H_{18}O$.

Storage. Store protected from light under an inert gas.

Propofol Injection

Propofol Injection is a sterile emulsion of Propofol in a suitable base.

Propofol Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of propofol, $C_{12}H_{18}O$.

Usual strength. 10 mg per ml.

Identification

A. Extract a volume of the injection containing 0.1 g of Propofol with three 25 ml quantities of *hexane* and filter the combined extracts using a glass fibre filter (such as Whatman GF/C). Extract the filtrate with two 20 ml quantities of *methanol* (90 per cent) and evaporate the combined extracts under reduced pressure. Dissolve the residue obtained in 2 ml of *ethanol* and evaporate to dryness under reduced pressure. Dry the residue at 50° over *phosphorus pentoxide* for 1 hour. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *propofol RS* or with the reference spectrum of propofol.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 6.0 to 8.5.

Propofol quinone and propofol dimer. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of injection containing 80 mg of Propofol in 100 ml of *propan-2-ol.*

Reference solution. A solution containing 0.0008 per cent w/v of *propofol RS*, 0.00008 per cent w/v of *2,6-bis(1-methylethyl)-1,4-benzoquinone RS* (*propofol impurity J RS*) and 0.0002 per cent w/v of *3,3',5,5'-tetrakis (1-methylethyl)biphenyl-4,4'-diol RS* (*propofol dimer RS*) in *propan-2-ol* containing 6.8 per cent v/v of *water.*

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (such as Hypersil ODS),
- mobile phase: a mixture of 40 volumes of *tetrahydrofuran* and 60 volumes of *water,*
- flow rate. 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Inject the reference solution. The relative retention time with reference to propofol for propofol impurity J is about 0.8 and for propofol dimer is about 2.5.

Inject the test solution and the reference solution. Run the chromatogram three times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of the peak due to propofol quinone (propofol impurity J) is not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.1 per cent) and the area of the peak due to propofol dimer is not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.25 per cent).

Globule size. Not more than 5000 globules more than or equal to 2 µm per ml of a 0.01 per cent v/v dilution in a filtered 0.9 per cent w/v solution of *sodium chloride*. By means of suitable equipment, pass the solution through a 50 µm aperture and count the number of globules by monitoring the change in electrical current between two electrodes immersed on either side of the aperture (such as Coulter Counter). Repeat the procedure using the 0.9 per cent w/v solution of *sodium chloride* only to determine the background count.

Free fatty acid. Not more than 7 millimoles per litre, when determined by the following method.

To 5 ml of a well shaken injection add 25 ml of a mixture of 40 volumes of *propan-2-ol*, 10 volumes of *n-heptane* and 1 volume of *0.5 sulphuric acid* and shake for 1 minute. Allow to stand for 10 minutes, add 15 ml of *n-heptane* and 15 ml of *water*. Mix by inverting the container 10 times and allow to stand for 15 minutes. To 15 ml of the upper phase add 5 ml of *nile blue A solution* and pass a stream of *nitrogen*, previously passed through *0.1 M sodium hydroxide*, through the solution. Titrate with 0.02 M sodium hydroxide, using a microburette. Calculate the content of free fatty acid from a calibration curve prepared from quantities of 1, 2, 4, 6 and 8 ml of a 1.282 per cent w/v solution of *palmitic acid* in *n-heptane*, each diluted to 50 ml with *n- heptane*. Carry out the method described above, using 5 ml of each solution and beginning at the words 'add 25 ml of a mixture'.

Lysolecithin. Not more than 0.2 per cent w/v.

Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of injection containing 0.1 g of Propofol in 100 ml of the mobile phase.

Reference solution. A 0.01 per cent w/v solution of *lysolecithin* in the mobile phase.

Chromatographic system

- a stainless steel column 15 cm X 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Nucleosil C18),
- mobile phase: a mixture of 1.4 volumes of *orthophosphoric acid*, 40 volumes of *water* and 60 volumes of *acetonitrile*,
- flow rate. 1.2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume. 250 µl.

Inject the test solution and the reference solution.

Calculate the content of lysolecithin.

Bacterial endotoxins (2.2.3). Not more than 1.65 Endotoxin Units per ml.

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of injection containing 80 mg of Propofol to 100 ml with the *propan-2-ol*.

Reference solution (a). A 0.08 per cent w/v solution of *propofol RS* in in *propan-2-ol* containing 6.8 per cent v/v of *water*.

Reference solution (b). A solution containing 0.0008 per cent w/v of *propofol RS* and 0.00008 per cent w/v of *propofol impurity J RS* in *propan-2-ol* containing 6.8 per cent v/v of *water*.

The chromatographic system described under Propofol quinone and propofol dimer may be used but using a detection wavelength of 275 nm and injecting 20 µl of each solution.

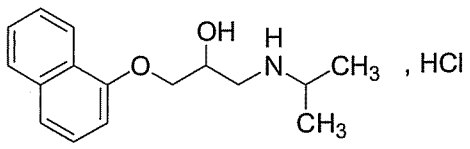
Inject reference solution (b). The test is not valid unless the resolution between the peaks due to propofol and propofol impurity J is not less than 2.5.

Inject the test solution and reference solution (b).

Calculate the content of $C_{12}H_{18}O$ in the injection.

Storage. Store at a temperature not exceeding 30°. It should not be allowed to freeze.

Propranolol Hydrochloride



$C_{16}H_{21}NO_2,HCl$ Mol. Wt. 295.8

Propranolol Hydrochloride is (*RS*)-1-[(1-methylethyl)amino]-3-(naphthalen-1-yloxy)propan-2-ol hydrochloride.

Propranolol Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{16}H_{21}NO_2$, HCl, calculated on the dried basis.

Category. Antihypertensive, antianginal and antiarrhythmic agent.

Dose. Orally, 20 mg to 2 g daily, in divided doses; the initial dose should not exceed 40 mg; by slow intravenous injection, 3 to 10 mg.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *propranolol hydrochloride RS* or with the reference spectrum of propranolol hydrochloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.002 per cent w/v solution in *methanol* shows absorption maxima at about 290 nm, 306 nm and 319 nm.

C. Gives reaction A of chlorides (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *methanol* is clear (2.4.1), and not more intensely coloured than degree 6 of the appropriate range of reference solutions (2.4.1).

pH (2.4.24). 5.0 to 6.0, determined in a 1.0 per cent w/v solution.

Specific optical rotation (2.4.22). –1.0° to +1.0°, determined in a 4.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in 10.0 ml of the mobile phase.

Reference solution. Dilute 2.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 1.6 g of *sodium laurylsulphate* and 0.31 g of *tetrabutylammonium dihydrogen phosphate* in a mixture of 1 ml of *sulphuric acid*, 450 ml of *water* and 550 ml of *acetonitrile*, adjust to pH 3.3 using *dilute sodium hydroxide solution*,
- flow rate. 1.8 ml per minute,
- spectrophotometer set at 292 nm,
- injection volume. 20 µl.

Inject the test solution and the reference solution. Run the chromatogram 7 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (0.1 per cent) and the sum of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (0.4 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.25 g, dissolve in 25 ml of *ethanol (95 per cent)* and titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25).

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.02958 g of $C_{16}H_{21}NO_2$, HCl.

Storage. Store protected from moisture.

Propranolol Injection

Propranolol Hydrochloride Injection

Propranolol Injection is a sterile solution of Propranolol Hydrochloride in Water for Injections containing Citric Acid.

Propranolol Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of propranolol hydrochloride, $C_{16}H_{21}NO_2$, HCl.

Usual strength. 1 mg per ml.

Identification

A. Make alkaline with *1 M sodium hydroxide* a volume containing 10 mg of Propranolol Hydrochloride and extract with three quantities, each of 5 ml, of *ether*. Wash the combined *extracts* with *water* until the washings are free from alkali, dry with *anhydrous sodium sulphate*, filter, evaporate the filtrate to dryness and dry the residue at 50° at a pressure of 2 kPa for 1 hour.

On the residue determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *propranolol hydrochloride RS* treated in the same manner or with the reference spectrum of propranolol.

B. When examined in the range 230 nm to 360 nm (2.4.7), the solution obtained in the Assay shows absorption maxima at about 290 nm, 306 nm and 319 nm.

Tests

pH (2.4.24). 3.0 to 3.5.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of injection containing about 100 mg of Propranolol Hydrochloride in 100 ml of *acetonitrile*.

Reference solution. Dilute 1 ml of the test solution to 500 ml with the mobile phase.

Chromatographic system
- a stainless steel column 20 cm x 5 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- mobile phase: a mixture of 1.15 g of *sodium dodecyl sulphate*, 10 ml of a mixture of 1 volume of *sulphuric acid* and 9 volumes of *water*, 20 ml of a 1.7 per cent w/v solution of *tetrabutylammonium dihydrogen orthophosphate*, 370 ml of *water* and 600 ml of *acetonitrile*, adjusted to pH 3.3 with *2 M sodium hydroxide*,
- flow rate. 1.8 ml per minute,
- spectrophotometer set at 292 nm,
- injection volume. 10 µl.

Inject the test solution and the reference solution. Run the chromatogram 5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than four times the area of the principal peak in the chromatogram obtained with the reference solution (0.8 per cent).

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. To an accurately measured volume containing about 2 mg of Propranolol Hydrochloride add sufficient *methanol* to produce 100.0 ml and measure the absorbance of the resulting solution at the maximum at about 290 nm (2.4.7). Calculate the content of $C_{16}H_{21}NO_2$, HCl taking 206 as the specific absorbance at 290 nm.

Storage. Store protected from light, in a single dose containers.

Propranolol Tablets

Propranolol Hydrochloride Tablets

Propranolol Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of propranolol hydrochloride, $C_{16}H_{21}NO_2$, HCl.

Usual strengths. 10 mg; 40 mg.

Identification

A.Suspend a quantity of the powdered tablets containing 0.1 g of Propranolol Hydrochloride in 20 ml of *water*, filter, make the filtrate alkaline with *1 M sodium hydroxide* and extract with three quantities, each of 10 ml, of *ether*. Wash the combined extracts with *water* until the washings are free from alkali, dry with *anhydrous sodium sulphate*, filter, evaporate the filtrate to dryness and dry the residue at 50° at a pressure of 2 kPa for 1 hour.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *propranolol hydrochloride RS* treated in t he same manner or with the reference spectrum of propranolol.

B. When examined in the range 230 nm to 360 nm (2.4.7), the final solution obtained in the Assay shows absorption maxima at about 290 nm, 306 nm and 319 nm.

Tests

Uniformity of content. *(For tablets containing 10 mg or less)* — Comply with the test stated under Tablets.

Transfer one tablet to a 100-ml volumetric flask, add 5 ml of *dilute hydrochloric acid* and allow to stand, swirling occasionally, until it is disintegrated. Add about 70 ml of *methanol* and shake well for about 1 minute. Dilute to volume with *methanol,* mix and centrifuge an aliquot of the solution. Dilute a suitable volume of the clear solution with *methanol* to produce a solution containing 20 µg of Propranolol Hydrochloride per ml. Measure the absorbance of the resulting solution at the maximum at about 290 nm (2.4.7), using *methanol* as the blank. Calculate the content of $C_{16}H_{21}NO_2$, HCl taking 206 as the specific absorbance at 290 nm.

Dissolution (2.5.2).

Apparatus No. 1,
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Dilute a suitable volume of the filtrate with the same solvent. Measure the absorbance of the resulting solution at the maximum at about 290 nm (2.4.7). Calculate the content of $C_{16}H_{21}NO_2$,HCl in the medium taking 206 as the specific absorbance at 290 nm.

D. Not less than 75 per cent of the stated amount of $C_{16}H_{21}NO_2$, HCl.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing about 100 mg of Propranolol Hydrochloride in 100.0 ml of *methanol* and filter.

Reference solution. Dilute 1 ml of the test solution to 500 ml with the mobile phase.

Chromatographic system
- a stainless steel column 20 cm x 5 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS),
- mobile phase: a mixture of 1.15 g of *sodium dodecyl sulphate*, 10 ml of a mixture of 1 volume of *sulphuric*

acid and 9 volumes of *water*, 20 ml of a 1.7 per cent w/v solution of *tetrabutylammonium dihydrogen orthophosphate*, 370 ml of *water* and 600 ml of *acetonitrile*, adjusted to pH 3.3 with *2 M sodium hydroxide*,
- flow rate. 1.8 ml per minute,
- spectrophotometer set at 292 nm,
- injection volume. 10 µl.

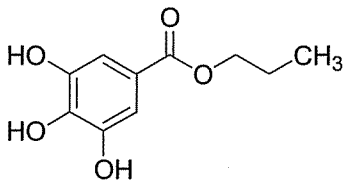
Inject the test solution and the reference solution. Run the chromatogram 5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent) and the sum of the areas of all the secondary peaks is not more than four times the area of the principal peak in the chromatogram obtained with the reference solution (0.8 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 20 mg of Propranolol Hydrochloride and shake with 20 ml of *water* for 10 minutes. Add 50 ml of *methanol*, shake for a further 10 minutes, add sufficient *methanol* to produce 100.0 ml and filter. Dilute 10.0 ml of the filtrate to 50.0 ml with *methanol* and measure the absorbance of the resulting solution at the maximum at about 290 nm (2.4.7). Calculate the content of $C_{16}H_{21}NO_2$, HCl taking 206 as the specific absorbance at 290 nm.

Storage. Store protected from light and moisture.

Propyl Gallate



$C_{10}H_{12}O_5$ Mol. Wt. 212.2

Propyl Gallate is propyl 3,4,5-trihydroxybenzoate.

Category. Pharmaceutical aid (antioxidant).

Description. A white or creamy white, crystalline powder; odourless or almost odourless.

Identification

A. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* shows an absorption maximum only at about 275 nm; absorbance at about 275 nm, about 0.49.

B. Dissolve 10 mg in 50 ml of *water*, cool and add 5 ml of *dilute ammonia solution*; a red colour is produced which becomes brown on standing and is restored on shaking.

C. Dissolve 5 mg in 50 ml of *water* and add 0.05 ml of *ferric chloride test solution*; a bluish black colour is produced.

Tests

Chlorides (2.3.12). Shake 1.0 g with 50 ml of *water* for 5 minutes and filter. 25 ml of the filtrate complies with the limit test for chlorides (500 ppm).

Sulphates (2.3.17). Shake 0.8 g with 100 ml of *water* for 5 minutes and filter. 15 ml of the filtrate complies with the limit test for sulphates (0.12 per cent).

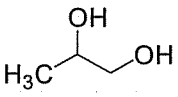
Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Storage. Store protected from light and moisture, in non-metallic containers.

Propylene Glycol

1, 2-Propanediol



$C_3H_8O_2$ Mol. Wt. 76.1

Propylene Glycol is (*RS*)-propane-1,2-diol.

Category. Pharmaceutical aid (humectant; solvent).

Description. A clear, colourless, viscous liquid; practically odourless; hygroscopic.

Identification

A. To 0.5 ml of a 0.01 per cent w/v solution, cooled in ice, add 5 ml of a cooled mixture of 10 ml of *water* and 90 ml of *sulphuric acid*. Heat for 10 minutes on a water-bath at 70°, cool and add 0.2 ml of a 3 per cent w/v solution of *ninhydrin* in a 2.5 per cent w/v solution of *sodium metabisulphite*; a violet colour slowly appears.

B. Heat 0.15 ml with 0.1 g of *boric acid*; a pleasant odour develops.

C. Add 1 ml to 0.5 g of *potassium bisulphate* and heat gently; a fruity odour develops and when the solution is heated to dryness, no sharp, acrid smell of acrolein is perceptible.

Tests

Appearance of solution. The substance under examination is clear (2.4.1), and colourless (2.4.1).

Acidity. Mix 10 ml with 40 ml of *water* and add 0.1 ml of *bromothymol blue solution*. The solution is greenish yellow and not more than 0.05 ml of *0.1 M sodium hydroxide* is required to change the colour to blue.

Boiling range (2.4.8). 184° to 189°.

Relative density (2.4.29). 1.035 to 1.040.

Refractive index (2.4.27). 1.431 to 1.433.

Heavy metals (2.3.13). Dilute 3 ml to 12 ml with *water*. The resulting solution complies with the limit test for heavy metals, Method D (5 ppm). Use *lead standard solution (1 ppm Pb)* to prepare the standard.

Oxidising substances. To 10 ml add 5 ml of *water*, 2 ml of *potassium iodide solution* and 2 ml of *1 M sulphuric acid* and allow to stand in a ground-glass-stoppered flask protected from light for 15 minutes. Titrate the liberated iodine with *0.05 M sodium thiosulphate* using 1 ml of *starch solution*, added towards the end of the titration, as indicator. Not more than 0.2 ml of *0.05 M sodium thiosulphate* is required.

Reducing substances. Mix 1 ml with 1 ml of *6 M ammonia* and heat on a water-bath at 60° for 5 minutes; the solution is not yellow. Immediately add 0.15 ml of *0.1 M silver nitrate*; the solution does not change its appearance within 5 minutes.

Ethylene glycol and diethylene glycol. Determine by gas chromatography (2.4.13).

Test solution. Dissolve 2 g of the substance under examination in sufficient *ethanol (95 per cent)* to produce 100 ml.

Reference solution. Dissolve 2 g of the substance under examination, 0.02 g of *ethylene glycol* and 0.02 g of *diethylene glycol* in *ethanol (95 per cent)* and dilute to 100 ml with the same solvent.

Chromatographic system
- a glass column 1.5 m x 3 mm, packed with 12 per cent Sorbitol on untreated siliceous earth (Such as Chromosorb W-NAW (SINS),
- temperature:
  column: 165°,
  inlet port and detector at 260°,
- flow rate. 30 ml per minute of the carrier gas.

Inject 3 µl or other suitable volume of the test solution. Record the chromatograms adjusting the sensitivity so that the height of the peak due to propylene glycol is more than 50 per cent of the full-scale deflection in the chromatograms. Inject the same volume of reference solution and record the chromatograms. The order of elution is propylene glycol, ethylene glycol and diethylene glycol. The test is not valid unless in the chromatogram obtained with the reference solution, the resolution between the peaks due to propylene glycol (first peak) and ethylene glycol (second peak) is not less than 1.0.

No peaks corresponding to ethylene glycol and diethylene glycol are obtained in the chromatogram obtained with the test solution.

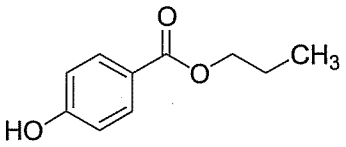
Sulphated ash (2.3.18). Not more than 0.01 per cent w/w, determined by the following method. Heat 50 g until it burns, and ignite. Allow to cool, moisten the residue with *sulphuric acid* and ignite; repeat the operations.

Water (2.3.43). Not more than 0.2 per cent, determined on 5.0 g.

Storage. Store protected from moisture.

Propylparaben

Propyl Hydroxybenzoate



$C_{10}H_{12}O_3$ Mol. Wt. 180.2

Propylparaben is propyl 4-hydroxybenzoate.

Propylparaben contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{10}H_{12}O_3$, calculated on the dried basis.

Category. Pharmaceutical aid (antimicrobial preservative).

Description. A white, crystalline powder; odourless.

Identification

A. When examined in the range 230 nm to 360 nm (2.4.7), a 0.0005 per cent w/v solution in *ethanol (95 per cent)* shows an absorbance maximum at about 258 nm; absorption at 258 nm, 0.44 to 0.47.

B. To about 10 mg in a test-tube add 1 ml of *sodium carbonate solution*, heat to boiling for 30 seconds and cool (solution A). To a further 10 mg in a test-tube add 1 ml of *sodium carbonate solution*; the substance partly dissolves (solution B). Add at the same time to each of the solutions A and B 5 ml of *aminophenazone solution* and 1 ml of *potassium ferricyanide solution* and mix. Solution B is yellow to orange-brown. Solution A is orange to red and the colour is clearly more intense than any similar colour that may be obtained with solution B.

Tests

Appearance of solution. A 10.0 per cent w/v solution in *ethanol (95 per cent)* is clear (2.4.1), and not more intensely coloured than reference solution BYS6 (2.4.1).

Acidity. Dissolve 1.0 g in sufficient *ethanol (95 per cent)* to produce 10 ml. To 2 ml of the solution add 3 ml of *ethanol (95 per cent)*, 5 ml of *carbon dioxide-free water* and 0.1 ml of *bromocresol green solution*. Not more than 0.1 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 1 volume of *glacial acetic acid*, 30 volumes of *water* and 70 volumes of *methanol*.

Test solution. Dissolve 0.1 g of the substance under examination in 10.0 ml of *acetone*.

Reference solution (a). Dilute 0.5 ml of the test solution to 100.0 ml with *acetone*.

Reference solution (b). Dissolve 10 mg of *ethyl parahydroxybenzoate RS* in 1.0 ml of the test solution and dilute to 10.0 ml with *acetone*.

Apply 2 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine in ultraviolet light at 254 nm. In the chromatogram obtained with the test solution, any secondary spot is not more intense than the corresponding spot in the chromatogram obtained with reference solution (a) (0.5 per cent) The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated principal spots.

Chlorides (2.3.12). Heat 2.0 g with 100 ml of *water*, cool, add sufficient *water* to restore the original volume, and filter. 25 ml of the filtrate complies with the limit test for chlorides (500 ppm).

Sulphates. To 10 ml of the filtrate obtained in the test for Chlorides add 0.15 ml of *dilute hydrochloric acid* and 0.1 ml of *barium chloride solution*; no turbidity is produced within 10 minutes.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

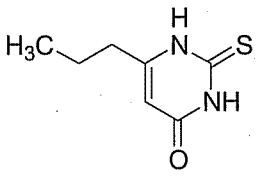
Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying over *silica gel* for 5 hours.

Assay. To 1.0 g add 20.0 ml of *1 M sodium hydroxide*. Heat at about 70° for 1 hour. Cool rapidly in an ice bath. Titrate the excess *sodium hydroxide* with *0.5 M sulphuric acid*, continuing the titration until the second point of inflexion and determining the end-point potentiometrically (2.4.25).

1 ml of *1 M sodium hydroxide* is equivalent to 0.1802 g of $C_{10}H_{12}O_3$.

Storage. Store protected from moisture.

Propylthiouracil



$C_7H_{10}N_2OS$ Mol. Wt. 170.2

Propylthiouracil is 2,3-dihydro-6-propyl-2-thioxopyrimidin-4(1*H*)-one.

Propylthiouracil contains not less than 98.0 per cent and not more than 100.5 per cent of $C_7H_{10}N_2OS$, calculated on the dried basis.

Category. Antithyroid.

Dose. 300 to 450 mg daily, in divided doses.

Description. A white or pale cream-coloured crystals or crystalline powder; odourless.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *propylthiouracil RS* or with the reference spectrum of propylthiouracil.

B. Examine the chromatograms obtained in the test for Related substances in ultraviolet light at 254 nm before exposure of the plate to iodine vapour. The principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (b).

C. To about 20 mg add 8 ml of *bromine water* and shake for a few minutes. Boil until the mixture is decolorised, allow to cool and filter. Add 2 ml of *barium chloride solution*; a white precipitate is produced. Add 5 ml of *2 M sodium hydroxide*; the precipitate does not become violet.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 100 volumes of *chloroform*, 12 volumes of *2-propanol* and 0.2 volume of *glacial acetic acid*.

Test solution (a). Dissolve 0.1 g of the substance under examination in 10 ml of *methanol*.

Test solution (b). Dissolve 0.1 g of the substance under examination in 100 ml of *methanol*.

Reference solution (a). A 0.01 per cent w/v solution of the substance under examination in *methanol*.

Reference solution (b). A 0.1 per cent w/v solution of *propylthiouracil RS* in *methanol*.

Reference solution (c). A 0.0005 per cent w/v solution of *thiourea* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. Expose the plate to iodine vapour for 10 minutes. By both methods of visualisation, any spot corresponding to thiourea in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (c) and any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (a).

Arsenic (2.3.10). Dissolve 2.0 g in 50 ml of *water* and add 10 ml of *stannated hydrochloric acid AsT*. The resulting solution complies with the limit test for arsenic (5 ppm).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method C (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in oven at 105°.

Assay. Weigh accurately about 0.3 g, add 30 ml of *water* and 30.0 ml (n_1 ml) of *0.1 M sodium hydroxide*, boil and shake until solution is complete. Add 50 ml of *0.1 M silver nitrate* with stirring, boil gently for 5 minutes, cool and titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25) (n_2 ml). Record the total volume ($n_1 + n_2$ ml) of *0.1 M sodium hydroxide* added.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.008511 g of $C_7H_{10}N_2OS$.

Storage. Store protected from light and moisture.

Propylthiouracil Tablets

Propylthiouracil Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of propylthiouracil, $C_7H_{10}N_2OS$.

Usual strength. 50 mg.

Identification

A. Shake a quantity of the powdered tablets containing 50 mg of Propylthiouracil with 20 ml of *methanol* for 10 minutes, filter and evaporate to dryness.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *propylthiouracil RS* or with the reference spectrum of propylthiouracil.

B. Shake a quantity of the powdered tablets containing 50 mg of Propylthiouracil with 60 ml of *methanol* for 20 minutes, dilute to 100 ml with *methanol* and filter. Dilute 5 ml of the filtrate to 250 ml with *methanol*. When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows an absorption maximum only at about 274 nm.

C. Extract a quantity of the powdered tablets in a continuous extraction apparatus (2.1.8) with *ether* and evaporate the solution to dryness. The residue, after drying at 105°, melts at about 219° (2.4.21).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 100 volumes of *chloroform*, 12 volumes of *2-propanol* and 0.2 volume of *glacial acetic acid*.

Test solution. Shake a quantity of the powdered tablets containing 50 mg of Propylthiouracil with 5 ml of *methanol* for 15 minutes, filter and use the filtrate.

Reference solution (a). Dilute 1 volume of the test solution to 100 volumes with *methanol*.

Reference solution (b). A 0.001 per cent w/v solution of thiourea in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. Expose the plate to iodine vapour for 10 minutes. By both methods of visualisation, any spot corresponding to thiourea in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (b) and any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (a).

Other tests. Comply with the tests stated under Tablets

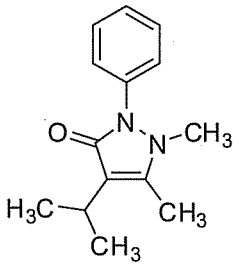
Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 0.15 g of Propylthiouracil, dissolve in a mixture of 20 ml of *0.1 M sodium hydroxide* and 75 ml of *water* with the aid of gentle heat. Cool, add 4 g of *sodium acetate*, just acidify the solution to *litmus paper* with *6 M acetic acid*, add 0.5 ml of a freshly prepared

0.5 per cent w/v solution of *1,5-diphenylcarbazone* in *ethanol (95 per cent)* and titrate with *0.02 M mercuric nitrate* until a pinkish violet colour persists for 2 to 3 minutes.

1 ml of *0.02 M mercuric nitrate* is equivalent to 0.006808 g of $C_7H_{10}N_2OS$.

Storage. Store protected from light and moisture.

Propyphenazone



$C_{14}H_{18}N_2O$ Mol. Wt. 230.3

Propyphenazone is 4-isopropyl-2,3-dimethyl-1-phenyl-3-pyrazolin-5-one.

Propyphenazone contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{14}H_{18}N_2O$, calculated on the dried basis.

Category. Analgesic; antipyretic.

Dose. 1.5 to 3 g daily, in divided doses.

Description. A white or slightly yellowish, crystalline powder; odourless.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *propyphenazone RS* or with the reference spectrum of propyphenazone.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (b).

C. Dissolve 2 g in sufficient of a mixture of equal volumes of *ethanol (95 per cent)* and *carbon dioxide-free water* to produce 50 ml (solution A). To 1 ml of solution A add 0.1 ml of *ferric chloride solution*; a brownish red colour is produced which becomes yellow on addition of 1 ml of *2 M hydrochloric acid*.

Tests

Appearance of solution. Solution A is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. To 10 ml of solution A add 0.1 ml of *phenolphthalein solution*; the solution is colourless. Add 0.2 ml of *0.01 M sodium hydroxide*; the solution is pink. Add 0.4 ml of *0.01 M hydrochloric acid*; the solution becomes colourless. Add 0.2 ml of *methyl red solution*; the solution is orange or red.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254*.

Mobile phase. A mixture of 45 volumes of *cyclohexane*, 45 volumes of *ethyl acetate* and 10 volumes of *1-butanol*.

Test solution (a). An 8 per cent w/v solution of the substance under examination in *methanol*.

Test solution (b). A 1.6 per cent w/v solution of the substance under examination in *methanol*.

Reference solution (a). A 0.016 per cent w/v solution of the substance under examination in *methanol*.

Reference solution (b). A 1.6 per cent w/v solution of *propyphenazone RS* in *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in a current of hot air for 15 minutes and examine in ultraviolet light at 254 nm. Spray the plate with a mixture of equal volumes of *potassium ferricyanide solution* and *ferric chloride solution*. By both methods of visualisation, any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a).

Arsenic (2.3.10). Mix 1.0 g with 10 ml of a 2 per cent w/v solution of *magnesium nitrate* in *ethanol* in a silica or platinum dish, evaporate on a water-bath and heat gradually in order to incinerate. If the material remains incompletely carbonised, moisten with a small quantity of *nitric acid* and ignite again. Cool, add 3 ml of *hydrochloric acid* and heat on a water-bath to dissolve the residue. The resulting solution complies with the limit test for arsenic (10 ppm).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 60° over *phosphorus pentoxide* at a pressure of 1.5 to 2.5 kPa for 4 hours.

Assay. Weigh accurately about 0.2 g of the dried material, dissolve in 30 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02303 g of $C_{14}H_{18}N_2O$.

Storage. Store protected from moisture.

Protamine Sulphate

Protamine Sulphate is a purified mixture of the sulphates of basic peptides prepared from the sperm or mature testes of suitable species of fish. It binds with heparin in solution, inhibiting its anticoagulant activity. It is prepared in conditions designed to minimise the degree of Microbial contamination.

Each mg of Protamine Sulphate precipitates not less than 100 Units of *heparin sodium RS*, calculated on the dried basis.

Category. Heparin antidote.

Dose. By slow intravenous injection over a 10-minute period, 1 mg for every 100 Units of heparin remaining in the patient if given within 15 minutes; maximum 50 mg.

Description. A white or almost white powder; hygroscopic.

Identification

A. Produces a precipitate under the conditions of the Assay.

B. Dissolve 0.2 g in 5 ml of *water* and dilute to 10 ml with the same solvent (solution A). To 0.5 ml of solution A add 4.5 ml of *water*, 1 ml of a 10 per cent w/v solution of *sodium hydroxide* and 1 ml of a 0.02 per cent w/v solution of *1-naphthol* and mix. Cool to 5° and add 0.5 ml of *alkaline sodium hypobromite solution*; an intense red colour is produced.

C. Heat 2 ml of solution A on a water-bath at 60°, add 0.1 ml of *mercuric sulphate solution* and mix; no precipitate is produced. Cool the mixture in ice; a white precipitate is produced.

D. Gives reaction A of sulphates (2.3.1).

Tests

Appearance of solution. To 2.5 ml of solution A add 7.5 ml of *water*. The resulting solution is not more opalescent than opalescence standard OS2 (2.4.1), and not more intensely coloured than reference solution BYS6 (2.4.1).

Specific optical rotation (2.4.22). –65.0° to –85.0°, determined at 20° in a 1.0 per cent w/v solution in *0.1 M hydrochloric acid*.

Light absorption (2.4.7). Dilute 2.5 ml of solution A to 5.0 ml with *water*. Absorbance of the resulting solution at 260 to 280 nm is not more than 0.1.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Iron (2.3.14). Dissolve 2.0 g in *water* with the aid of heat and dilute to 20 ml with *water*. The resulting solution complies with the limit test for iron (20 ppm).

Mercury. Add 20 ml of a mixture of equal volumes of *nitric acid* and *sulphuric acid* to 2.0 g in a 250-ml flask fitted with a ground-glass stopper, boil under a reflux condenser for 1 hour, cool and carefully dilute with *water*. Boil until nitrous fumes are no longer evolved. Cool, carefully dilute the solution to 200 ml with *water*, mix and filter. Transfer 50 ml of the filtrate to a separating funnel. Shake with successive small quantities of *chloroform* until the *chloroform* layer remains colourless. To the aqueous layer add 25 ml of *1 M sulphuric acid*, 115 ml of *water* and 10 ml of a 20 per cent w/v solution of *hydroxylamine hydrochloride*. Titrate with *dithizone solution*; after each addition, shake the mixture 20 times and towards the end-point of the titration allow to separate and discard the chloroform layer. Titrate until a greenish blue colour is produced. Calculate the content of mercury using the equivalent of mercury in µg per ml of titrant determined in the standardisation of the dithizone solution (10 ppm).

Nitrogen (2.3.30). 21.0 to 26.0 per cent, calculated on the dried basis, determined by Method C.

Sulphates. 16 to 24 per cent, determined by the following method. Dissolve 0.15 g in 15 ml of *water* in a beaker, add 5 ml of *2 M hydrochloric acid* and heat to boiling. Slowly add to the boiling solution 10 ml of *barium chloride solution*. Cover and heat on a *water*-bath for 1 hour. Filter and wash the precipitate several times with small quantities of hot *water*. Dry and ignite the residue to constant weight at 600°.

1 g of the residue is equivalent to 0.4117 g of SO_4.

Abnormal toxicity (2.2.1). Complies with the test for abnormal toxicity, using 0.5 mg dissolved in 0.5 ml of water for injections.

Loss on drying (2.4.19). Not more than 5.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Prepare solutions of the substance under examination in *water* containing (1) 0.015 per cent w/v (2) 0.01 per cent w/v and (3) 0.005 per cent w/v. Titrate each of the solutions in duplicate with a 174 IU per ml or a suitable dilution of *heparin sodium RS* using the following procedure. Introduce an accurately measured volume of the solution to be titrated, for example 1.5 ml, into the cell of a suitable spectrophotometer, set the instrument at a suitable wavelength (none is critical) in the visible range and add the titrant in small volumes until there is a sharp increase in the absorbance. Note the volume of titrant added.

Carry out three independent assays. For each individual titration, calculate the number of Units of heparin titrated per mg of the substance under examination. Calculate the result of the assay as the average of the 18 values. Test the linearity of the response by standard statistical methods. The assay is

not valid unless the standard deviations calculated for the results obtained with each test solution are less than 5 per cent of the average result.

Protamine Sulphate intended for use in the manufacture of Parenteral Preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 7.0 Endotoxin Units per mg of protamine sulphate.

Protamine Sulphate intended for use in the manufacture of Parenteral Preparations without a further appropriate sterilisation procedure complies with the following additional requirement.

Sterility. Complies with the test for sterility (2.2.11).

Storage. Store protected from moisture. If it is intended for use in the manufacture of Parenteral Preparations, the container should be sterile and sealed so as to exclude micro-organisms.

Labelling. The label states whether or not the contents are intended for use in the manufacture of Parenteral Preparations.

Protamine Sulphate Injection

Protamine Sulphate Injection is a sterile solution of Protamine Sulphate in Water for Injections.

Protamine Sulphate Injection contains not less than 80.0 per cent of the stated amount of protamine sulphate.

Usual strengths. 50 mg in 5 ml; 100 mg in 10 ml.

Identification

A. Produces a precipitate under the conditions of the Assay.

B. Dilute a suitable volume with *water* to give a solution containing 0.2 per cent w/v solution of Protamine Sulphate. To 5 ml of this solution add 1 ml of a 10 per cent w/v solution of *sodium hydroxide* and 1 ml of a 0.02 per cent w/v solution of *1-naphthol* and mix. Cool to 5° and add 0.5 ml of *alkaline sodium hypobromite solution*; an intense red colour is produced.

C. Heat 2 ml on a water-bath at 60°, add 0.1 ml of *mercuric sulphate solution* and mix; no precipitate is produced. Cool the mixture in ice; a white precipitate is produced.

D. Gives reaction A of sulphates (2.3.1).

Tests

pH (2.4.24). 2.5 to 3.5.

Optical rotation (2.4.22). –0.52° to –0.68°, determined in a solution prepared by diluting the injection with *0.5 M hydrochloric acid* so as to contain 0.8 per cent w/v of Protamine Sulphate.

Light absorption. Dilute the injection, if necessary, with *water* to produce a solution containing 1 per cent w/v solution of Protamine Sulphate. Absorbance of the resulting solution at 260 to 280 nm, not more than 0.1 (2.4.7).

Bacterial endotoxins (2.2.3). Not more than 7.0 Endotoxin Units per mg of protamine sulphate.

Abnormal toxicity. Complies with the test for abnormal toxicity (2.2.1), using a volume containing 0.5 mg of Protamine Sulphate.

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

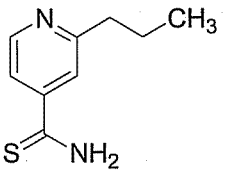
Assay. Prepare solutions of the substance under examination in *water* containing (1) 0.015 per cent w/v (2) 0.01 per cent w/v and (3) 0.005 per cent w/v. Titrate each of the solutions in duplicate with a 174 IU per ml or a suitable dilution of *heparin sodium RS* using the following procedure. Introduce an accurately measured volume of the solution to be titrated, for example 1.5 ml, into the cell of a suitable spectrophotometer, set the instrument at a suitable wavelength (none is critical) in the visible range and add the titrant in small volumes until there is a sharp increase in the absorbance. Note the volume of titrant added.

Carry out three independent assays. For each individual titration, calculate the number of Units of heparin titrated per mg of the substance under examination. Calculate the result of the assay as the average of the 18 values. Test the linearity of the response by standard statistical methods. The assay is not valid unless the standard deviations calculated for the results obtained with each test solution are less than 5 per cent of the average result.

Storage. Store protected from light, in single dose containers.

Labelling. The label states (1) that the dose is calculated from the results of determinations of the amount required to produce an acceptable blood-clotting time in the patient; (2) the approximate number of Units of heparin activity 1 ml is capable of neutralising.

Prothionamide



$C_9H_{12}N_2S$ Mol. wt. 180.3

Prothionamide is 2-propyl-4-pyridinecarbothioamide.

Prothionamide contains not less than 99.0 per cent and not more than 101.0 per cent of $C_8H_{10}N_2S$,calculated on the dried basis.

Category. Antitubercular.

Description. A yellow, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *prothionamide RS*.

B. When examined in the range 230 nm to 350 nm (2.4.7), a 0.002 per cent w/v solution in *ethanol (95 per cent)* shows an absorption maximum only at about 291 nm. The absorbance at 291 nm is about 0.78.

Tests

Acidity. Dissolve 2.0 g in 20 ml of *methanol*, heating to about 50°, and add 20 ml of *water*. Cool slightly, shake until crystallisation occurs, if any and allow to cool to room temperature. Add 60 ml of *water* and titrate with *0.1 M sodium hydroxide* using 0.2 ml of *cresol red solution* as indicator. Not more than 0.2 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator to red.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in the mobile phase and dilute to 100 ml with the mobile phase.

Reference solution. A 0.025 per cent w/v solution of *prothionamide RS* in the mobile phase. Dilute 1 ml of the solution to 100 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: 60 volumes of a buffer solution prepared by mixing 2.0 ml of *triethylamine* with 1000 ml of *water*, adjusting the pH to 6.0 with *dilute orthophosphoric acid* and 40 volumes of *acetonitrile,*
- flow rate.1 ml per minute,
- spectrophotometer set at 290 nm,
- injection volume. 20 µl.

Inject the reference solution.The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject alternatively the test solution and the reference solution. In the chromatogram obtained with the test solution the area of any individual impurity peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all such peaks is not more than twice the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent).

Heavy Metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances using the following solutions.

Test solution. Dissolve 50.0 mg of the substance under examination in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 5.0 ml of this solution to a 50.0 ml with the mobile phase.

Reference solution. A 0.05 per cent w/v solution of *prothionamide RS* in the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency is not less than 5000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_9H_{12}N_2S$.

Storage. Store protected from light and moisture.

Prothionamide Tablets

Prothionamide Tablets contain not less than 90.0 per cent not more than 110.0 per cent of the stated amount of prothionamide, $C_9H_{12}N_2S$.

Usual strength. 250 mg.

Identification

A. Extract a quantity of the powdered tablets containing 25 mg of Prothionamide with 5 ml of *methanol*, filter and evaporate the filtrate to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *prothionamide RS*.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 2,

Medium. 900 ml *0.1 M hydrochloric acid,*

Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the dissolution medium if necessary, at the maximum at about 290 nm (2.4.7). Calculate the content of $C_9H_{12}N_2S$ in the medium from the absorbance obtained from a solution of known concentration of *prothionamide RS* in the same medium.

D. Not less than 75 per cent of the stated amount of $C_9H_{12}N_2S$.

Related substances. Determine by liquid chromatography (2.4.14) as described under Assay using the following solutions.

Test solution. Weigh accurately a quantity of the powdered tablets containing 50 mg of Prothionamide disperse in the mobile phase, shake, dilute to 100 ml with the mobile phase and filter.

Reference solution. A solution containing 0.025 per cent w/v of *prothionamide RS* in the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject alternatively the test solution and the reference solution. In the chromatogram obtained with the test solution the area of any individual impurity peak is not more than the area of the peak in the chromatogram obtained with the reference solution (0.5 per cent) and the sum of the areas of all such impurities is not more than twice the area of the peak in the chromatogram obtained with the reference solution (1.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 50 mg of Prothionamide, disperse in the mobile phase, shake and dilute to 100.0 ml with the mobile phase. Dilute 5.0 ml of the resulting solution to 50.0 ml with the mobile phase.

Reference solution. A 0.05 per cent w/v solution of *prothionamide RS* in the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by mixing 2.0 ml of *triethylamine* with 1000 ml of *water* and adjusting the pH to 6.0 with *dilute orthophosphoric acid*, and 40 volumes of *acetonitrile,*
- flow rate. 1 ml per minute,
- spectrophotometer set at 290 nm,
- injection volume. 20 µl.

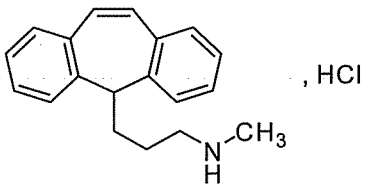
Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 the column efficiency is not less than 5000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_9H_{12}N_2S$ in the tablets.

Storage. Store protected from light and moisture.

Protriptyline Hydrochloride



$C_{19}H_{21}N,HCl$ Mol. Wt. 299.8

Protriptyline Hydrochloride is 3-(5*H*-dibenzo[*a*,*d*]cyclohept-5-yl)propyl(methyl)amine hydrochloride.

Protriptyline Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{19}H_{21}N,HCl$, calculated on the dried basis.

Category. Tricyclic antidepressant.

Description. A white to yellowish white powder.

Identification

A. Dissolve 0.1 g in 10 ml of *water*, make alkaline with *1M sodium hydroxide*, extract with 5 ml of *chloroform*, dry with *anhydrous sodium sulphate* and evaporate the solvent using a current of nitrogen. On the oily residue, determine by the infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *protriptyline hydrochloride RS* or with the reference spectrum of protriptyline hydrochloride.

B. Gives reaction A of chlorides (2.3.1).

Tests

pH (2.4.24). 5.0 to 6.5, determined in a 1.0 per cent w/v solution.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 60° at a pressure not exceeding 0.7 kPa.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Weigh accurately about 0.7 g, dissolve in 0.5 ml of *acetic anhydride* and 20 ml of *anhydrous glacial acetic acid*, add 10 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1M perchloric acid* is equivalent to 0.02998 g of $C_{19}H_{21}N$,HCl.

Protriptyline Tablets

Protriptyline Hydrochloride Tablets

Protriptyline Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of protriptyline hydrochloride, $C_{19}H_{21}N$, HCl.

Usual strength. 5 mg.

Identification

A. When examined in the range 230 to 350 nm (2.4.7), a solution obtained in the Assay exhibits a maximum only at 292 nm.

B. Shake a quantity of the powdered tablets containing about 5 mg of Protriptyline Hydrochloride with 20 ml of *methanol* and filter. To 1 ml of the filtrate add 1 ml of a 2.5 per cent w/v solution of *sodium hydrogen carbonate*, 1 ml of a 2 per cent w/v solution of *sodium periodate* and 1 ml of a 0.3 per cent w/v solution of *potassium permanganate*. Allow to stand for 15 minutes, acidify with *1 M sulphuric acid* and extract with 10 ml of *2,2,4-trimethylpentane*, washing the extract with 10 ml of *0.25 M sulphuric acid*. The absorbance of trimethylpentane solution does not exhibit a maxima at 265 nm (2.4.7) (distinction from amitriptyline and nortriptyline).

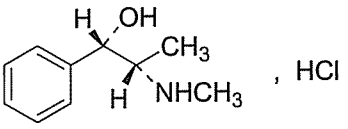
C. Triturate a quantity of the powdered tablets containing about 0.1 g of Protriptyline Hydrochloride with 10 ml of *chloroform*, filter and evaporate the filtrate to dryness. Dissolve part of the residue in 3 ml of *water* and add 0.05 ml of a 2.5 per cent w/v solution of *quinhydrone* in *methanol*. A red colour develops.

Tests

Other tests. Comply with the tests stated under Tablets.

Assay. Triturate 10 tablets for 15 minutes with 100 ml of a solution prepared by mixing 1 volume of *1 M hydrochloric acid* and 9 volumes of *methanol* , transfer to a graduated flask using sufficient of the solvent mixture to produce 250 ml, mix and filter. Dilute a volume of the filtrate containing about 1 mg of Protriptyline Hydrochloride to 100 ml with the solvent mixture and measure the absorbance at the maximum at 292 nm (2.4.7). Calculate the content of $C_{19}H_{21}N$, HCl taking 465 as the absorbance.

Pseudoephedrine Hydrochloride



$C_{10}H_{15}NO$,HCl Mol. Wt. 201.7

Pseudoephedrine Hydrochloride is (1*S*,2*S*)-2-methylamino-1-phenylpropan-1-ol hydrochloride.

Pseudoephedrine Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{10}H_{15}NO$, HCl, calculated on the dried basis.

Category. Sympathomimetic.

Dose. 60 mg three to four times daily.

Description. A white, crystalline powder; odourless or almost odourless.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pseudoephedrine hydrochloride RS* or with the reference spectrum of pseudoephedrine hydrochloride.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.1 per cent w/v solution shows absorption maxima at about 251 nm, 257 nm and 263 nm; absorbances at the maxima, about 0.75, about 0.98 and about 0.78, respectively.

C. A 5 per cent w/v solution gives the reactions of chlorides (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution is not more than very faintly opalescent and colourless (2.4.1).

pH (2.4.24). 4.6 to 6.0, determined in a 5.0 per cent w/v solution.

Specific optical rotation (2.4.22). +61.0° to +62.5°, determined in a 5.0 per cent w/v solution using a 2-dm tube.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 50 mg of the substance under examination in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dissolve 20 mg of *ephedrine hydrochloride RS* (*pseudoephedrine impurity A RS*) in 20.0 ml of the mobile phase. Dilute 1.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Reference solution (c). Dissolve 10 mg of *ephedrine hydrochloride RS* (*pseudoephedrine impurity A RS*) in 5 ml of the test solution and dilute to 100 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with phenylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 6 volumes of *methanol* and 94 volumes of 1.2 per cent w/v solution of *ammonium acetate*, adjusted to pH 4.0 with *glacial acetic acid*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 257 nm,
- injection volume. 20 µl.

Inject the test solution, reference solution (a), (b) and (c). Run the chromatogram 1.5 times the retention time of pseudoephedrine. The relative retention time with reference to pseudoephedrine for pseudoephedrine impurity A is about 0.89. The test is not valid unless the resolution between the peaks due to pseudoephedrine impurity A and pseudoephedrine is not less than 2.0. In the chromatogram obtained with the test solution the area of the peak due to pseudoephedrine impurity A is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent), the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). The sum of all the secondary peaks other than pseudoephedrine impurity A is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Weigh accurately about 0.5 g, dissolve in a mixture of 50 ml of *anhydrous glacial acetic acid* and 10 ml of *mercuric acetate solution.* Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02017 g of $C_{10}H_{15}NO$, HCl.

Storage. Store protected from light and moisture.

Pseudoephedrine Syrup

Pseudoephedrine Hydrochloride Syrup

Pseudoephedrine Syrup is a solution of Pseudoephedrine Hydrochloride in a suitable flavoured vehicle.

Pseudoephedrine Syrup contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of pseudoephedrine hydrochloride, $C_{10}H_{15}NO$, HCl.

Usual strength. 30 mg per 5 ml.

Identification

A. Shake a quantity of the syrup containing 120 mg of Pseudoephedrine Hydrochloride with two quantities, each of 30 ml, of *ether*, and discard the ether layer. Add 4 ml of *1 M sodium hydroxide* to the aqueous layer and extract with two quantities, each of 10 ml, of *ether*. Dry the combined ether extracts with *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pseudoephedrine hydrochloride RS* treated in the saame manner or with the reference spectrum of pseudoephedrine.

B. The residue obtained in test A melts at about 118° (2.4.21).

C. Dissolve 50 mg of the residue obtained in test A in 10 ml of *0.1 M hydrochloric acid*; it is dextro-rotatory.

Tests

Other tests. Complies with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. To an accurately measured volume of the syrup containing about 0.12 g of Pseudoephedrine Hydrochloride, add 50 ml of *0.1 M hydrochloric acid* mix, add sufficient *0.1 M hydrochloric acid* to produce 100.0 ml, filter and use the filtrate.

Reference solution. A 0.12 per cent w/v solution of *pseudoephedrine hydrochloride RS* in *0.1 M hydrochloric acid.*

Chromatographic system
- a stainless steel column 25 cm x 4.2 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 85 volumes of *ethanol* and 15 volumes of a 0.4 per cent w/v solution of *ammonium acetate*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Inject the reference solution and record the chromatogram. The test is not valid unless the relative standard deviation is not more than 2.0 per cent and the tailing factor is not more than 1.5.

Inject alternately the test solution and the reference solution.

Determine the weight per ml of the syrup (2.4.29), and calculate the content of $C_{10}H_{15}NO$, HCl weight in volume.

Storage. Store protected from light and moisture.

Pseudoephedrine Tablets

Pseudoephedrine Hydrochloride Tablets

Pseudoephedrine Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of pseudoephedrine hydrochloride, $C_{10}H_{15}NO$, HCl.

Usual strength. 60 mg.

Identification

A. Shake a quantity of the powdered tablets containing 60 mg of Pseudoephedrine Hydrochloride with 10 ml of *water* and filter. Shake the filtrate with 10 ml of *ether*, discard the ether layer. Add 1 ml of *1 M sodium hydroxide* to the aqueous layer and extract with two quantities, each of 10 ml, of *ether*. Dry the combined ether extracts with *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pseudoephedrine hydrochloride RS* treated in the same manner or with the reference spectrum of pseudoephedrine.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (b).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 40 volumes of *butyl acetate*, 20 volumes of *acetone*, 20 volumes of *1-butanol*, 10 volumes of *5 M ammonia* and 10 volumes of *methanol*.

Test solution (a). Add 25 ml of *methanol* to a quantity of the powdered tablets containing 0.5 g of Pseudoephedrine Hydrochloride, shake for 5 minutes, filter, wash the filter with *methanol* and evaporate the combined filtrate and washings to dryness. Dissolve the residue as completely as possible in 5 ml of *methanol*, centrifuge and use the supernatant liquid.

Test solution (b). Dilute 1 volume of the test solution to 10 volumes with *methanol*.

Reference solution (a). Dilute 1 volume of the test solution to 100 volumes with *methanol*.

Reference solution (b). A 1.0 per cent w/v solution of *pseudoephedrine hydrochloride RS* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in a current of warm air, spray with a solution containing 0.3 g of *ninhydrin* in a mixture of 100 ml *1-butanol* and 3 ml of *glacial acetic acid* and heat at 120° for 20 minutes. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a). Ignore any yellow spot near the line of application.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. To a quantity of the powdered tablets containing about 0.12 g of Pseudoephedrine Hydrochloride, add 50 ml of *0.1 M hydrochloric acid* mix with the aid of ultrasound for 15 minutes, add sufficient *methanol* to produce 100.0 ml, filter and use the filtrate.

Reference solution. A 0.12 per cent w/v solution of *pseudoephedrine hydrochloride RS* in *methanol (50 per cent)*.

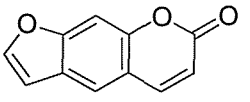
Chromatographic system
- a stainless steel column 20 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- mobile phase: *0.005 M dioctyl sodium sulphosuccinate* in a mixture of 65 volumes of *methanol*, 35 volumes of *water* and 1 volume of *glacial acetic acid*,
- flow rate: 1.5 ml per minute,
- spectrophotometer set at 258 nm,
- injection volume. 20 µl.

Inject alternately the test solution and the reference solution.

Calculate the content of $C_{10}H_{15}NO$,HCl in the tablets.

Storage. Store protected from light and moisture.

Psoralen



$C_{11}H_6O_3$ Mol. Wt. 186.2

Psoralen is 7*H*-furo[3,2-*g*][1]benzopyran-7-one, obtained from the fruits of *Psoralea carylifolia* Linn. (Fam. Leguminosae) and from the leaves of *Ficus carica* (Fam. Urticaceae) or prepared by synthesis.

Psoralen contains not less than 95.0 per cent and not more than 101.0 per cent of $C_{11}H_6O_3$, calculated on the dried basis.

Category. Topical pigmenting agent.

Description. Colourless needles; odourless.

Identification

A. Dissolve 1 mg in 5 ml of *ethanol (95 per cent)* and add 15 ml of a mixture containing 43 volumes of *water*, 5 volumes of *acetic acid* and 3 volumes of *propylene glycol*; a blue fluorescence is visible in ultraviolet light at 365 nm.

B. Dissolve 1 mg in 2 ml of *ethanol (95 per cent)* and add 0.1 ml of *0.1 M sodium hydroxide*; a yellow fluorescence is visible in ultraviolet light at 365 nm.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 90 volumes of *benzene* and 10 volumes of *ethyl acetate*.

Test solution. Dissolve 0.2 g of the substance under examination in 10 ml of *chloroform*.

Reference solution. Dilute 1 volume of the test solution to 100 volumes with *chloroform*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 365 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105°.

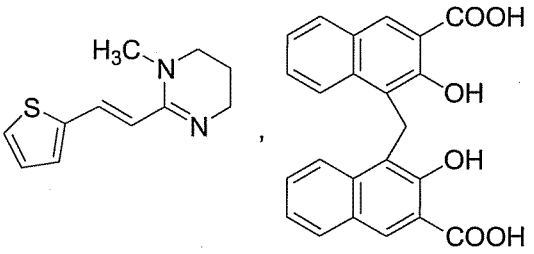
Assay. Weigh accurately about 0.1 g and dissolve in sufficient *methanol* to produce 100.0 ml. Dilute 2.0 ml of this solution to 100.0 ml with *methanol* and measure the absorbance of the resulting solution at the maximum at about 247 nm (2.4.7).

Calculate the content of $C_{11}H_6O_3$ from the absorbance obtained by repeating the operation using a final solution of 20 µg per ml of *psoralen RS* in *methanol* in place of the substance under examination.

Storage. Store protected from light and moisture.

Pyrantel Pamoate

Pyrantel Embonate



$C_{11}H_{14}N_2S, C_{23}H_{16}O_6$ Mol. Wt. 594.7

Pyrantel Pamoate is 1,4,5,6-tetrahydro-1-methyl-2-[(*E*)-2-(2-thienyl)vinyl]pyrimidine hydrogen; 4,4′-methylene bis(3-hydroxynaphthalene-2-carboxylate).

Pyrantel Pamoate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{34}H_{30}N_2O_6S$, calculated on the dried basis.

Category. Anthelmintic.

Dose. 10 mg per kg

Description. A pale yellow or yellow powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pyrantel pamoate RS* or with the reference spectrum of pyrantel pamoate.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE— Prepare the solutions immediately before use and protected from light.

Solvent mixture. Mix 25 volumes of *glacial acetic acid*, 25 volumes of *water* and 10 volumes of *diethylamine* with cooling.

Test solution. Dissolve 80 mg of the substance under examination in 7 ml of the solvent mixture and dilute to 100.0 ml with mobile phase.

Reference solution (a). Dissolve 10.0 mg of *1-methyl-2-[(Z)-2-(thiophen-2-yl)-1,4,5,6-tetrahydropyrimidine RS* (*pyrantel impurity A RS*) in the solvent mixture, add 2.5 ml of the test solution and dilute to 50.0 ml with the mobile phase. Dilute 2.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with silica gel (5 µm),

- mobile phase: 7.2 volumes of the solvent mixture and 92.8 volumes of *acetonitrile,*
- flow rate. 1 ml per minute,
- spectrophotometer set at 288 nm,
- injection volume. 20 µl.

Inject reference solution (a). Run the chromatogram for 4 times the retention time of pyrantel. The test is not valid unless the resolution between the peaks due to pyrantel and pyrantel impurity A is at least 4.0. The relative retention times with reference to pyrantel pamoate are about 0.5 for pamoic acid, about 1.3 for pyrantel impurity A and about 1.8 for ((*E*)-*N*-{methylamino)propyl]-3-(thiophen-2-yl)prop-2-enamide) pyrantel impurity B.

Inject the test solution, reference solutions (a) and (b). For the calculation of content, multiply the peak area of pyrantel impurity B by 0.4. In the chromatogram obtained with the test solution, the area of the peak due to pyrantel impurity A is not more than the corresponding peak in the chromatogram obtained with reference solution (a) (0.5 per cent); the area of the peak due to pyrantel impurity B is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent); the area any other secondary peak is not more than 0.2 times the area of the principal peak in the chromatogram obtained with the reference solution (b) (0.1 per cent) and the sum of the areas of all the secondary peaks other than those of pyrantel impurities A and B is not more than 0.6 times the area of the principal peak in the chromatogram obtained with the reference solution (b) (0.3 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Chlorides (2.3.12). To 0.7 g, add 10 ml of *dilute nitric acid* and 30 ml of *water*. Heat on water-bath for 5 minutes and cool. The resulting solution complies with the limit test for chlorides (360 ppm).

Sulphates (2.3.17). To 0.5 g, add 2.5 ml of *dilute nitric acid* and dilute to 50 ml with *water*. Heat on water bath for 5 minutes. 15 ml complies with the limit test for sulphates (0.1 per cent).

Iron (2.3.14). Ignite 0.54 g at 800° for 2 hours. Dissolve the residue in 2.5 ml of *dilute hydrochloric acid* with gentle heating for 10 minutes and cool. The resulting solution complies with the limit test for iron (75 ppm).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in vacuum at 60° for 3 hours.

Assay. Weigh accurately about 0.5 g, add 10 ml of *acetic anhydride* and 50 ml *glacial acetic acid*. Heat at 50° and stir for 10 minutes. Allow to cool (a clear solution is not obtained). Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.05947 g of $C_{34}H_{30}N_2O_6S$.

Storage. Store protected from light.

Pyrantel Pamoate Oral Suspension

Pyrantel Pamoate Oral Suspension is a suspension of Pyrantel Pamoate in a suitable flavoured aqueous vehicle.

Pyrantel Pamoate Oral Suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of pyrantel, $C_{11}H_{14}N_2S$.

Usual strength. 50 mg per ml

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel H*.

Mobile phase. The upper layer of a mixture obtained by shaking 20 volumes of *methyl isobutyl ketone*, 10 volumes of *formic acid* and 10 volumes of *water*.

Test solution. Dilute a known volume of the oral suspension with sufficient *0.05 M methanolic ammonia* to produce a solution containing about 8 mg of pyrantel per ml. Shake the mixture by mechanical means and centrifuge. Use the clear supernatant liquid.

Reference solution. A solution of *pyrantel pamoate RS* in *0.05 M methanolic ammonia* containing 0.008 per cent w/v of *pyrantel*.

Apply to the plate 100 µl of each solution. Allow the mobile phase to rise to about 17 cm. Dry the plate in air and examine in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. In the Assay, the major peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 4.5 to 6.0

Other tests. Complies with the tests stated under Oral Liquids.

Assay. Determine by liquid chromatography (2.4.14).

NOTE— Carry out the test protected from light.

Test solution. Weigh accurately a quantity of the oral suspension containing about 60 mg of pyrantel, disperse in

60 ml of *water* and add sufficient *water* to produce 100.0 ml. Dilute 1.0 ml of the well-stirred suspension to 25.0 ml with the mobile phase to obtain a clear solution. Mix and filter.

Reference solution. Weigh accurately about 20 mg of *pyrantel pamoate RS* and dissolve in sufficient mobile phase to produce 25.0 ml. Dilute 10.0 ml of the resulting solution to 100.0 ml with the mobile phase and mix.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with porous silica particles (5 to 10 µm),
- mobile phase: a mixture of 92.8 volumes of *acetonitrile*, 3 volumes of *acetic acid*, 3 volumes of *water* and 1.2 volumes of *diethylamine*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 288 nm,
- injection volume. 20 µl.

Inject the reference solution. The resolution between pyrantel and pamoic acid is not less than 10.0, the column efficiency for the pyrantel peak is not less than 8000 theoretical plates, the tailing factor for the pyrantel peak is not greater than 1.3 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

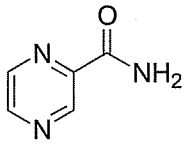
Inject the test solution and the reference solution. Continue the chromatography for a period not less than 2.5 times the retention times of pyrantel base. The relative retention times for pamoic acid and pyrantel base are about 0.6 and 1.0 respectively.

Determine the weight per ml (2.4.29) of the suspension and calculate the content of $C_{11}H_{14}N_2S$, weight in volume.

Storage. Store protected from light at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of pyrantel.

Pyrazinamide



$C_5H_5N_3O$ Mol. Wt. 123.1

Pyrazinamide is pyrazine-2-carboxamide.

Pyrazinamide contains not less than 99.0 per cent and not more than 100.5 per cent of $C_5H_5N_3O$, calculated on the anhydrous basis.

Category. Antitubercular.

Dose. Up to 35 mg per kg of body weight daily, in divided doses.

Description. A white or almost white, crystalline powder; odourless or almost odourless.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pyrazinamide RS* or with the reference spectrum of pyrazinamide.

B. Dissolve 50 mg in *water* and dilute to 100 ml with the same solvent (solution A). Dilute 1 ml of solution A to 10 ml. When examined in the range 290 nm to 360 nm (2.4.7), the resulting solution shows an absorption maximum at about 310 nm. Dilute 2 ml of solution A to 100 ml with *water*. When examined in the range 230 nm to 290 nm, the solution shows an absorption maximum at about 268 nm; absorbance at about 268 nm, between 0.64 and 0.68.

C. Boil 20 mg with 5 ml of *sodium hydroxide solution*; ammonia, recognisable by its odour, is evolved.

Tests

Appearance of solution. A 1.0 per cent w/v solution in *carbon dioxide-free water* (solution B) is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. To 25 ml of solution B add 0.05 ml of *phenolphthalein solution* and 0.2 ml of *0.01 M sodium hydroxide*; the solution is red. Add 1 ml of *0.01 M hydrochloric acid*; the solution is colourless. Add 0.15 ml of *methyl red solution*; the solution is red.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 60 volumes of *1-butanol*, 20 volumes of *glacial acetic acid* and 20 volumes of *water.*

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of a mixture of 90 volumes of *chloroform* and 10 volumes of *methanol.*

Reference solution. A 0.002 per cent w/v solution of the substance under examination in a mixture of 90 volumes of *chloroform* and 10 volumes of *methanol.*

Apply to the plate 20 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.4.19). Not more than 0.5 per cent, determined on 5.0 g.

Assay. Weigh accurately about 0.3 g and transfer to the flask of an ammonia distillation apparatus. Add 200 ml of *water* and 75 ml of *sodium hydroxide solution*. Boil gently for 20 minutes, collecting the distillate in 50.0 ml of *0.05 M sulphuric acid*. Boil vigorously to complete the distillation of the ammonia and titrate the excess of acid with *0.1 M sodium hydroxide*, using *methyl red solution* as indicator. Repeat the operation without the substance under examination. The difference between the titrations represents the amount of acid required to neutralise the ammonia formed.

1 ml of *0.05 M sulphuric acid* is equivalent to 0.01231 g of $C_5H_5N_3O$.

Storage. Store protected from moisture.

Pyrazinamide Tablets

Pyrazinamide Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of pyrazinamide, $C_5H_5N_3O$.

Usual strengths. 250 mg; 500 mg; 750 mg; 1000 mg.

Identification

A. Shake a quantity of the powdered tablets containing 0.25 g of Pyrazinamide with 20 ml of *ethanol*, filter, evaporate the filtrate to dryness and dry the residue at 105° for 30 minutes.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pyrazinamide RS* or with the reference spectrum of pyrazinamide.

B. Shake a quantity of the powdered tablets containing 50 mg of Pyrazinamide with 50 ml of *water*, dilute to 100 ml with *water* and filter (solution A). Dilute 1 ml of solution A to 10 ml with *water*. When examined in the range 290 nm to 360 nm (2.4.7), the resulting solution shows an absorption maximum at about 310 nm. Dilute 2 ml of solution A to 100 ml with *water*. When examined in the range 230 nm to 290 nm, the resulting solution shows an absorption maximum at about 268 nm; absorbance at 268 nm, between 0.64 and 0.68.

C. Boil a quantity of the powdered tablets containing 20 mg of Pyrazinamide with 5 ml of *sodium hydroxide solution*; ammonia, recognisable by its odour, is evolved.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 60 volumes of *1-butanol*, 20 volumes of *glacial acetic acid* and 20 volumes of *water*.

Test solution. Shake a quantity of the powdered tablets containing 0.1 g of Pyrazinamide with 50 ml of a mixture of 90 volumes of *chloroform* and 10 volumes of *methanol*, filter, evaporate to dryness and dissolve the residue in sufficient of the same solvent mixture to produce 10 ml.

Reference solution. Dilute 1 volume of the test solution to 500 volumes with a mixture of 90 volumes of *chloroform* and 10 volumes of *methanol*.

Apply to the plate 20 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

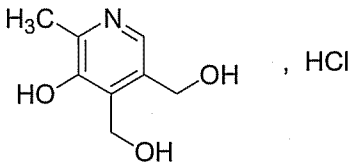
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 0.1 g of Pyrazinamide, add 200 ml of *water*, allow to stand for 10 minutes, swirling occasionally, mix with the aid of ultrasound for 10 minutes and dilute to 500.0 ml with *water*. Filter and discard the first 20 ml of the filtrate. Dilute 5.0 ml of the filtrate to 100.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 268 nm (2.4.7). Calculate the content of $C_5H_5N_3O$ taking 650 as the specific absorbance at 268 nm.

Storage. Store protected from moisture.

Pyridoxine Hydrochloride

Vitamin B_6



$C_8H_{11}NO_3,HCl$ Mol. Wt. 205.6

Pyridoxine Hydrochloride is 5-hydroxy-6-methylpyridine-3,4-dimethanol hydrochloride.

Pyridoxine Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_8H_{11}NO_3,HCl$, calculated on the dried basis.

Category. B group vitamin; sideroblastic anaemia therapy; anti-isoniazid neuropathy.

Dose. In deficiency states, prophylactic, upto 2 mg daily; therapeutic, 20 to 50 mg upto three times daily. In multi- vitamin

preparations for oral use, prophylactic, 500 µg to 1.5 mg daily; therapeutic, 1.5 to 3 mg daily. In sideroblastic anaemia, 100 to 400 mg daily, in divided doses. In isoniazid neuropathy, prophylactic, 10 mg daily; therapeutic, 50 mg three times daily.

Description. A white or almost white, crystalline powder; odourless.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B may be omitted if tests A, C and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pyridoxine hydrochloride RS* or with the reference spectrum of pyridoxine hydrochloride.

B. When examined in the range 250 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *0.1 M hydrochloric acid* shows an absorption maximum at 288 nm to 296 nm; absorbance at the maximum, 0.420 to 0.445. A solution prepared by diluting 1 ml of a 0.1 per cent w/v solution in *0.1 M hydrochloric acid* to 100 ml with *0.025 M standard phosphate buffer* shows absorption maxima at 248 nm to 256 nm and at 320 nm to 327 nm; absorbances at the maxima, 0.175 to 0.195 and 0.345 to 0.365, respectively.

C. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (b).

D. A 5 per cent w/v solution gives reaction A of chlorides (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution is clear (2.4.1), and not more intensely coloured than reference solution YS7 (2.4.1).

pH (2.4.24). 2.4 to 3.0, determined in a 5.0 per cent w/v solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 65 volumes of *acetone*, 13 volumes of *dichloromethane*, 13 volumes of *tetrahydrofuran* and 9 volumes of *strong ammonia solution*.

Test solution (a). A 10 per cent w/v solution of the substance under examination in *water*.

Test solution (b). A 1 per cent w/v solution of the substance under examination *water*.

Reference solution (a). A 0.025 per cent w/v solution of the substance under examination in *water*.

Reference solution (b). A 1 per cent w/v solution of *pyridoxine hydrochloride RS* in *water*.

Apply to the plate 2 µl of each solution. After development, dry the plate in air and spray with a 5 per cent w/v solution of *sodium carbonate* in a mixture of 70 volumes of *water* and 30 volumes of *ethanol (95 per cent)*. Dry in a current of air, spray with a 0.1 per cent w/v solution of *2,6-dichloroquinone-4-chloroimide* in *ethanol (95 per cent)* and examine immediately. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a). Ignore any spots remaining on the line of application.

Heavy metals (2.3.13). 12 ml of a 5.0 per cent w/v solution complies with the limit test for heavy metals, Method D (20 ppm). Use *lead standard solution (1 ppm Pb)* to prepare the standard.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.15 g, dissolve in a mixture of 5 ml of *anhydrous glacial acetic acid* and 6 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator, until a green colour is produced. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02056 g of $C_8H_{11}NO_3$, HCl.

Storage. Store protected from moisture.

Pyridoxine Tablets

Pyridoxine Hydrochloride Tablets

Pyridoxine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of pyridoxine hydrochloride, $C_8H_{11}NO_3$, HCl.

Usual strength. 5 mg.

Identification

A. Shake a quantity of the powdered tablets containing 20 mg of Pyridoxine Hydrochloride with 50 ml of *0.025 M standard phosphate buffer* for 15 minutes and dilute to 100 ml with the same solvent. Mix, filter and dilute 5 ml of the filtrate to 100 ml with the same solvent. When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution exhibits two maxima, at about 254 nm and 324 nm.

B. Triturate a quantity of the powdered tablets containing 20 mg of Pyridoxine Hydrochloride with 50 ml of *water* and allow to stand for 20 minutes. To 1 ml of the supernatant liquid add 10 ml of a 5 per cent w/v solution of *sodium acetate*, 1 ml of *water* and 1 ml of a 0.5 per cent w/v solution of *2,6-dichloroquinone-4-chloroimide* in *ethanol (95 per cent)* and

shake; a blue colour is produced which fades rapidly and becomes brown. Repeat the operation but adding 1 ml of a 0.3 per cent w/v solution of *boric acid* in place of 1 ml of *water*; no blue colour is produced.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 65 volumes of *acetone*, 13 volumes of *dichloromethane*, 13 volumes of *tetrahydrofuran* and 9 volumes of *strong ammonia solution*.

Test solution. Shake a quantity of the powdered tablets containing 40 mg of Pyridoxine Hydrochloride with 10 ml of *water* for 15 minutes, filter and use the filtrate.

Reference solution. Dilute 1 ml of test solution to 200 ml with *water*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and spray with a 5 per cent w/v solution of *sodium carbonate* in a mixture of 70 volumes of *water* and 30 volumes of *ethanol (95 per cent)*. Dry it in a current of air, spray with a 0.1 per cent w/v solution of *2,6-dichloroquinone-4-chloroimide* in *ethanol (95 per cent)* and examine immediately. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution.

Uniformity of content. Comply with the test stated under Tablets.

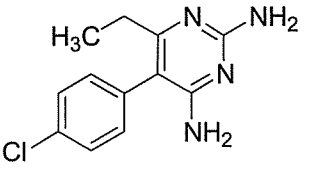
Powder one tablet, add 50 ml of *0.1 M hydrochloric acid* and heat on a water-bath for 15 minutes, swirling occasionally. Cool, dilute to 100.0 ml with *0.1 M hydrochloric acid*, filter, discarding the first 20 ml of the filtrate. If necessary, dilute quantitatively and stepwise with *0.1 M hydrochloric acid* to produce a solution containing 10 µg of the pyridoxine hydrochloride per ml and measure the absorbance of the resulting solution at the maximum at about 290 nm (2.4.7). Calculate the content of $C_8H_{11}NO_3$, HCl taking 430 as the specific absorbance at 290 nm.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 20 mg of Pyridoxine Hydrochloride, add 50 ml of *0.1 M hydrochloric acid* and heat on a water-bath for 15 minutes, swirling occasionally. Cool, dilute to 100.0 ml with *0.1 M hydrochloric acid* and filter, discarding the first 20 ml of the filtrate. Dilute 5.0 ml of the filtrate to 100.0 ml with *0.1 M hydrochloric acid* and measure the absorbance of the resulting solution at the maximum at about 290 nm (2.4.7). Calculate the content of $C_8H_{11}NO_3$, HCl taking 430 as the specific absorbance at 290 nm.

Storage. Store protected from light and moisture.

Pyrimethamine



$C_{12}H_{13}ClN_4$ Mol. Wt. 248.7

Pyrimethamine is 5-(4-chlorophenyl)-6-ethylpyrimidine-2,4-diamine.

Pyrimethamine contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{12}H_{13}ClN_4$, calculated on the dried basis.

Category. Antimalarial.

Dose. Used only in combination with sulphadoxine (25 mg pyrimethamine and 500 mg sulphadoxine) or dapsone (12.5 mg pyrimethamine and 100 mg dapsone).

Description. Colourless crystals or an almost white, crystalline powder; odourless.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pyrimethamine RS* or with the reference spectrum of pyrimethamine.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (b).

C. Dissolve 0.14 g in sufficient *ethanol* to produce 100 ml, dilute 10 ml of this solution to 100 ml with *0.1 M hydrochloric acid* and dilute 10 ml of the solution to 100 ml with the same solvent. When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows an absorption maximum at about 272 nm; absorbance at about 272 nm, 0.43 to 0.46.

Tests

Appearance of solution. Dissolve 0.25 g in sufficient of a mixture of 3 volumes of *dichloromethane* and 1 volume of *methanol* to produce 10 ml. The resulting solution is clear (2.4.1), and not more intensely coloured than reference solution BYS6 (2.4.1).

Acidity or alkalinity. Shake 1.0 g with 50 ml of *water* for 2 minutes and filter (solution A). To 10 ml of solution A add

0.05 ml of *phenolphthalein solution*; the solution is colourless and not more than 0.2 ml of *0.01 M sodium hydroxide* is required to change the colour to pink. Add 0.4 ml of *0.01 M hydrochloric acid* and 0.05 ml of *methyl red solution*; the solution is red or orange.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 76 volumes of *toluene*, 12 volumes of *glacial acetic acid*, 8 volumes of *1-propanol* and 4 volumes of *chloroform*.

Prepare the following solutions immediately before use.

Test solution (a). Dissolve 0.1 g of the substance under examination in 10 ml of a mixture of 90 volumes of *chloroform* and 10 volumes of *methanol*.

Test solution (b). Dissolve 0.1 g of the substance under examination in 100 ml of the same solvent mixture.

Reference solution (a). A 0.0025 per cent w/v solution of the substance under examination in the same solvent mixture.

Reference solution (b). A 0.1 per cent w/v solution of *pyrimethamine RS* in the same solvent mixture.

Apply to the plate 20 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a).

Sulphates (2.3.17). 25 ml of Solution A complies with the limit test for sulphates. Use a mixture of 5.0 ml of *sulphate standard solution (10 ppm SO_4)* and 10 ml of *distilled water* to prepare the standard (100 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

Assay. Weigh accurately about 0.2 g, dissolve in 25 ml of *anhydrous glacial acetic acid*, heating gently, cool. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02487 g of $C_{12}H_{13}ClN_4$.

Storage. Store protected from light and moisture.

Pyrimethamine Tablets

Pyrimethamine Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of pyrimethamine, $C_{12}H_{13}ClN_4$.

Usual strength. 25 mg.

Identification

A. Shake a quantity of the powdered tablets containing 50 mg of Pyrimethamine with 50 ml of *ethanol (95 per cent)* for 20 minutes, filter and evaporate the filtrate to dryness. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *pyrimethamine RS* or with the reference spectrum of pyrimethamine.

B. Extract the powdered tablets with *1 M sulphuric acid*, filter and add *potassium tetraiodomercurate solution* to the filtrate. A creamy white precipitate is produced.

C. Extract a quantity of the powdered tablets containing 50 mg of Pyrimethamine with two 10 ml quantities of *chloroform* and evaporate the combined extracts to dryness. The residue melts at about 240° (2.4.21).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Solvent mixture. 90 volumes of *chloroform* and 10 volumes of *methanol*.

Mobile phase. A mixture of 4 volumes of *chloroform*, 8 volumes of *1-propanol*, 12 volumes of *glacial acetic acid* and 76 volumes of *toluene*.

Test solution. Shake a quantity of the powdered tablets containing 50 mg Pyrimethamine with 5 ml of solvent mixture and filter.

Reference solution. Dilute 1 ml of the test solution to 400 ml with the solvent mixture.

Apply to the plate 20 µl of each solution. Allow the mobile phase to rise 10 cm. After development, dry the plate in air and examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (0.25 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 0.025g of Pyrimethamine, add 50 ml of hot *0.1 M hydrochloric acid* and heat on a water-bath for 10 minutes, swirling occasionally. Mix with the aid of ultrasound for 30 minutes, remove and cool to room temperature. Add sufficient *0.1 M hydrochloric acid* to produce 100 ml, filter and dilute 5 ml of the filtrate to 100 ml with *0.1 M hydrochloric acid* and measure the absorbance of the resulting solution at the maximum at about 272 nm (2.4.7). Calculate the content of $C_{12}H_{13}ClN_4$ taking 316 as the specific absorbance at 272 nm.

Pyrimethamine and Sulphadoxine Tablets

Pyrimethamine and Sulphadoxine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of pyrimethamine, $C_{12}H_{13}ClN_4$, and of sulphadoxine, $C_{12}H_{14}N_4O_4S$.

Usual strength. Pyrimethamine 25 mg and sulphadoxine 500 mg.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 4 volumes of *chloroform*, 4 volumes of *n-heptane*, 1 volume of *glacial acetic acid* and 4 volumes of a mixture of 1 volume of *methanol* and 19 volumes of *ethanol*.

Test solution. Shake a quantity of the powdered tablets containing 25 mg of Pyrimethamine with 50 ml of a 2 per cent w/v solution of *strong ammonia solution* in *methanol*.

Reference solution (a). A 0.05 per cent w/v solution of *pyrimethamine RS* in *methanol*.

Reference solution (b). A 1.0 per cent w/v solution of *sulphadoxine RS* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. One of the principal spots in the chromatogram obtained with the test solution corresponds to the spot in the chromatogram obtained with reference solution (a) and the other corresponds to that in the chromatogram obtained with reference solution (b).

Tests

Other tests. Complies with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh accurately a quantity of the powdered tablets containing about 25 mg of Pyrimethamine and 500 mg of Sulphadoxine and shake with 35 ml of *acetonitrile* for 30 minutes in a 100-ml volumetric flask. Dilute to volume with the mobile phase, mix and filter. To 25.0 ml of the filtrate add 2.0 ml of solution A prepared by dissolving 0.1 g of *phenacetin* (internal standard) in 100 ml of *acetonitrile* and sufficient of the mobile phase to produce 50.0 ml.

Reference solution. Weigh accurately about 25 mg of *pyrimethamine RS* and 500 mg of *sulphadoxine RS*, add 35 ml of *acetonitrile* and sufficient of the mobile phase to produce 100.0 ml and mix. To 25.0 ml add 2.0 ml of solution A and add sufficient of the mobile phase to produce 50.0 ml and mix well.

Chromatographic system

- a stainless steel column 30 cm x 4 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 4 volumes of a 1 per cent v/v solution of *glacial acetic acid* and 1 volume of *acetonitrile*,
- flow rate. 2 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent. The relative retention times with reference to phenacetin for sulphadoxine is about 0.7 and for pyrimethamine is about 1.3.

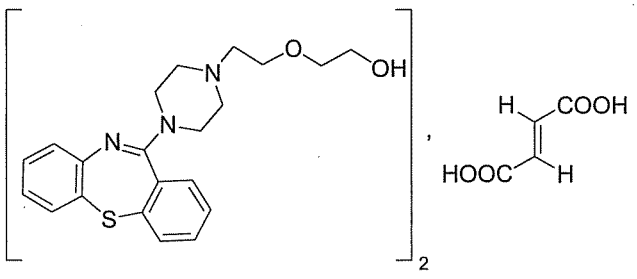
Inject the test solution and the reference solution.

Calculate the content of $C_{12}H_{13}ClN_4$ and the content of $C_{12}H_{14}N_4O_4S$ in the tablets.

Storage. Store protected from light and moisture.

Q

Quetiapine Fumarate



$(C_{21}H_{25}N_3O_2S)_2,C_4H_4O_4$ Mol. Wt. 883.1

Quetiapine Fumarate is 2-[2-(4-dibenzo[*b,f*][1,4]thiazepin-11-yl-1-piperazinyl)ethoxy]ethanol fumarate

Quetiapine Fumarate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{42}H_{50}N_6O_4S_2,C_4H_4O_4$ calculated on the dried basis.

Dose. 300 to 450 mg per day.

Category. Antipsychotic.

Description. A white to off-white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *quetiapine fumarate RS*. If the spectra obtained show differences, dissolve the substance under examination and the reference substance in *methanol* with the aid of ultrasound. if necessary. Evaporate the solvent under nitrogen at 50° for 2 hours and determine on the residues.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Fumaric acid. 12.6 to 13.6 per cent.

Weigh accurately about 0.35 g, dissolve in 80 ml of *dimethylformamide*. Titrate with *0.1 M tetra butyl ammonium hydroxide,* determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M tetra butyl ammonium hydroxide* is equivalent to 0.0058 g of fumaric acid.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 50.0 ml of the mobile phase.

Reference solution (a). A 0.001 per cent w/v solution of *quetiapine fumarate RS* in the mobile phase.

Reference solution (b). A 0.05 per cent w/v solution of *fumaric acid* in the mobile phase.

Reference solution (c). Dissolve 1 mg of *quetiapine fumarate RS* and 1.5 mg of *2-(4-Dibenzo[b,f][1,4] thiazepine-11-yl-Piperazin-1-yl)-ethanol RS* (*quetiapine impurity A RS*) in 100 ml of the mobile phase. Dilute 5 ml of the solution to 50 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm) (Such as C8-Novapak),
- mobile phase: a mixture of 500 volumes of *methanol*, 400 volumes of *water*, 100 volumes of *acetonitrile* and 0.4 volume of *triethylamine,* adjusted to pH 7.0 with *orthophosphoric acid*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Inject reference solution (c). The test is not valid unless the resolution between the peaks corresponding to quetiapine impurity A and quetiapine in the chromatogram obtained with the reference solution (c) is not less than 1.5.

Inject the test solution, reference solution (a) and (b). Run the chromatograms for three times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the peak in the chromatogram obtained with the reference solution (a) (0.5 per cent) and the sum of the areas of all the secondary peaks is not more than the area of the peak in the chromatogram obtained with the reference solution (a) (1.0 per cent). Ignore the peak due to fumaric acid.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 1 hour.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 50.0 ml of the mobile phase.

Reference solution. A 0.1 per cent w/v solution of *quetiapine fumarate RS* in the mobile phase.

Use the chromatographic system described in the test for Related substances.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency in not less than 2000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $(C_{21}H_{25}N_3O_2S)_2,C_4H_4O_4$.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Quetiapine Tablets

Quetiapine Fumarate Tablets

Quetiapine Tablets contain Quetiapine Fumarate equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of quetiapine, $C_{21}H_{25}N_3O_2S$.

Dose. 25 mg; 50 mg; 100 mg.

Identification

In the Assay, the principal peak in the chromatogram of the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1,
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 50 rpm and 45 minutes.

Test solution. Withdraw about 10 ml of the medium and centrifuge. Dilute the supernatant liquid suitably with *0.1 M hydrochloric acid* to obtain a solution containing about 10 µg per ml, of quetiapine.

Reference solution. Dissolve about 58 mg of *quetiapine fumarate RS* in 15 ml of the dissolution medium and dilute to 100.0 ml with the medium. Dilute 2.0 ml of the solution to 100.0 ml with the same medium.

Measure the absorbance of the reference solution and test solution at 248 nm (2.4.7) against *0.1 M hydrochloric acid* as the blank. Calculate the content of quetiapine in the medium from the absorbance obtained from a solution of known concentration of *quetiapine fumarate RS* in the same medium.

D. Not less than 70 per cent of the stated amount of quetiapine.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14)

Test solution. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing 250 mg of quetiapine, disperse in 100.0 ml of the mobile phase, with the aid of ultrasound and dilute to 250.0 ml with the mobile phase. Dilute 5 ml of the solution to 50 ml with the mobile phase.

Reference solution. Weigh accurately about 58 mg of *quetiapine fumarate RS*, add 30 ml of the mobile phase and dissolve with aid of ultrasound. Cool and dilute to 50.0 ml with the mobile phase. Dilute 5.0 ml of this solution to 50.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of *water* and 60 volumes of *methanol.* Add 0.4 ml of *triethylamine* and adjust pH to 6.8 with *orthophosphoric acid,*
- flow rate. 1 ml per minute,
- spectrophotometer set at 289 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

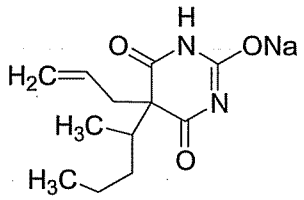
Calculate the content of $C_{21}H_{25}N_3O_2S$ in the tablets.

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the equivalent amount of quetiapine.

Quinalbarbitone Sodium

Quinalbarbital Sodium; Secobarbital Sodium; Secobarbitone Sodium; Soluble Quinalbarbitone



$C_{12}H_{17}N_2NaO_3$ Mol.Wt.260.3

Quinalbarbitone Sodium is sodium (*RS*)-5-allyl-5-(1-methylbutyl)barbiturate.

Quinalbarbitone Sodium contains not less than 98.5 per cent and not more than 102.0 per cent of $C_{12}H_{17}N_2NaO_3$, calculated on the dried basis.

Category. Hypnotic.

Dose. 100 to 200 mg.

Description. A white powder; odourless; hygroscopic.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B, C and D may be omitted if tests A and E are carried out.

A. To 10 ml of a 10.0 per cent w/v solution in *ethanol (95 per cent)* add 120 ml of *water* and 5 ml of *2 M acetic acid*, stir vigorously, add 200 ml of *water* and boil until the precipitate dissolves and no oily particles remain on the surface of the liquid. Allow to cool until a haziness begins to appear in the solution, induce crystallisation, if necessary and allow the solution to stand for 12 hours. Wash the crystals with three quantities, each of 10 ml, of *water* and dry the residue at 80°.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *quinalbarbitone RS* treated in the same manner.

B. To 0.5 g, add 5 ml of *sodium carbonate solution* and 10 ml of *nitrobenzyl chloride solution*. Heat for 30 minutes on a water-bath under reflux and allow to stand for 1 hour. Filter, wash the precipitate successively with 10 ml of *dilute sodium hydroxide solution* and 50 ml of *water*; recrystallise from a mixture of equal volumes of *chloroform* and *ethanol (95 per cent)* and dry at 105°. The crystals melt at about 156° (2.4.21)

C. Complies with the test for identification of barbiturates (2.3.2).

D. Gives the reaction of non-nitrogen substituted barbiturates (2.3.1).

E. Ignite 1 g; the residue gives the reactions of sodium salts (2.3.1).

Tests

Appearance of solution. A freshly prepared 10.0 per cent w/v solution in *ethanol (95 per cent)* is clear (2.4.1), and not more intensely coloured than reference solution YS7 (2.4.1).

pH (2.4.24). Not more than 11.0, determined on a 10.0 per cent w/v solution.

Heavy metals (2.3.13). 0.67 g dissolved in a mixture of 5 ml of *1 M sodium hydroxide* and 20 ml of *water* complies with the limit test for heavy metals, Method C (30 ppm).

Related substances. Complies with the test for related substances in barbiturates (2.3.4).

Loss on drying (2.4.19). Not more than 3.0 per cent, determined on 0.5 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.5 g, dissolve in 10 ml of *ethanol*, add 10 ml of *silver nitrate-pyridine reagent* and titrate with *0.1 M ethanolic sodium hydroxide* using 0.5 ml of *thymolphthalein solution* as indicator, until a pure blue colour is obtained. Carry out a blank titration.

1 ml of *0.1 M ethanolic sodium hydroxide* is equivalent to 0.02603 g of $C_{12}H_{17}N_2NaO_3$.

Storage. Store protected from moisture.

Quinalbarbitone Tablets

Quinalbarbital Sodium Tablets; Quinalbarbitone Sodium Tablets; Secobarbital Sodium Tablets; Secobarbitone Sodium Tablets

Quinalbarbitone Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of quinalbarbitone sodium, $C_{12}H_{17}N_2NaO_3$. The tablets are coated.

Usual strength. 100 mg.

Identification

A. Shake a quantity of the powdered tablets containing about 0.5 g of Quinalbarbitone Sodium with 10 ml of *water* and filter. To 10 ml of the filtrate add 5 ml of *sodium carbonate solution* and 10 ml of *nitrobenzyl chloride solution*. Heat for 30 minutes on a water-bath under reflux and allow to stand for 1 hour. Filter, wash the precipitate successively with 10 ml of *dilute sodium hydroxide solution* and 50 ml of *water*; recrystallise from a mixture of equal volumes of *chloroform and ethanol (95 per cent)* and dry at 105°. The crystals melt at about 156° (2.4.21)

B. Triturate a quantity of the powdered tablets containing 0.5 g of Quinalbarbitone Sodium with 10 ml of *water*, filter, acidify the filtrate with *acetic acid*; oily drops are formed which may eventually crystallise.

C. The powdered tablets give the reactions of sodium salts (2.3.1).

Tests

Other tests. Comply with the tests stated under Tablets.

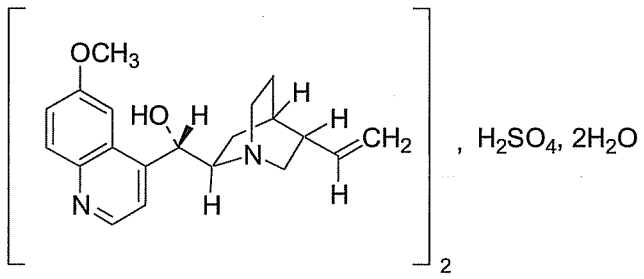
Assay. Weigh and digest 20 tablets with 50 ml of *water* until completely disintegrated and not more than a small residue remains. Add 5 ml of *1 M sodium hydroxide*, filter and wash the residue with sufficient *water* to produce 100.0 ml. Extract a volume of the solution containing 0.5 g of Quinalbarbitone Sodium with two quantities, each of 10 ml, of *ether*, washing each ether extract with the same 3 ml of *water*. Add the water to the aqueous liquid, acidify with *hydrochloric acid* and extract with successive quantities, each of 15 ml, of *ether* until complete extraction is effected. Wash the combined extracts with two quantities, each of 2 ml, of *water* and extract the combined washings with 10 ml of *ether*. Add the ether to the main ether layer, filter and wash the filter with *ether*. Evaporate the solvent and dry the residue to constant weight at 50°.

1 g of residue is equivalent to 1.092 g of $C_{12}H_{17}N_2NaO_3$.

Storage. Store protected from moisture.

Quinidine Sulphate

Quinidine Bisulphate



$(C_{20}H_{24}N_2O_2)_2,H_2SO_4,2H_2O$ Mol. Wt. 783.0

Quinidine Sulphate is (8*R*,9*S*)-6′ -methoxycinchonan-9-ol sulphate dihydrate. The alkaloid is obtained from the bark of various species of *Cinchona* and from *Remijia pedunculata* Fluckiger (Fam. *Rubiaceae*) or prepared from quinine.

Quinidine Sulphate contains not less than 99.0 per cent and not more than 101.5 per cent of alkaloid monosulphates, calculated as $(C_{20}H_{24}N_2O_2)_2,H_2SO_4$ on the dried basis.

Category. Antiarrhythmic.

Dose. In the treatment of cardiac arrhythmias, 200 mg daily in three or four divided doses. In the treatment of atrial fibrillation, 200 to 400 mg every 2 to 4 hours, upto 3 g daily.

Description. A white or almost white, crystalline powder or needle-like crystals; odourless.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 60 volumes of *toluene*, 36 volumes of *ether* and 15 volumes of *diethylamine*.

Test solution. Dissolve 1 g of the substance under examination in 100 ml of *methanol*.

Reference solution (a). A 1 per cent w/v solution of *quinidine sulphate RS* in *methanol*.

Reference solution (b). A 1 per cent w/v solution of each of *quinidine sulphate RS* and *quinine sulphate RS* in *methanol*.

Apply to the plate 4 µl of each solution. After development, dry the plate in air for 15 minutes and repeat the development. Dry the plate at 105° for 30 minutes, allow to cool and spray with *potassium iodoplatinate solution*. The principal spot in the chromatogram obtained with the test solution corresponds to the spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

B. To 5 ml of a 0.1 per cent w/v solution add 0.2 ml of *bromine solution* and 1 ml of *dilute ammonia solution*; an emerald-green colour is produced.

C. To a 0.5 per cent w/v solution add an equal volume of *dilute sulphuric acid*; a strong blue fluorescence is produced.

D. To 5 ml of a 1 per cent w/v solution add 1 ml of *silver nitrate solution* and stir with a glass rod; after a short interval, a white precipitate soluble in *nitric acid* is produced (distinction from many other alkaloids).

E. A 1 per cent w/v solution gives the reactions of sulphates (2.3.1).

Tests

Appearance of solution. A 2.0 per cent w/v solution in *0.1 M hydrochloric acid* is clear (2.4.1), and not more intensely coloured than reference solution GYS4 (2.4.1).

pH (2.4.24). 6.0 to 6.8, determined in a 1.0 per cent w/v solution.

Specific optical rotation (2.4.22). +275° to +290°, determined in a 2.0 per cent w/v solution in *0.1 M hydrochloric acid*.

Dihydroquinidine sulphate. Not more than 15.0 per cent, calculated on the dried basis and determined by the following method. Dissolve 0.2 g in 20 ml of *water*, add 0.5 g of *potassium bromide* and 15 ml of *2 M hydrochloric acid*. Titrate slowly with *0.0167 M potassium bromate* using *methyl red solution* as indicator until a yellow colour is obtained. Add a solution of 0.5 g of *potassium iodide* in 200 ml of *water* and stopper the flask immediately. Allow to stand in the dark for 5 minutes and titrate with *0.1 M sodium thiosulphate* using *starch solution*, added towards the end of the titration, as indicator. Repeat the operation without the substance under examination.

1 ml of *0.0167 M potassium bromate* is equivalent to 0.01867 g of $(C_{20}H_{24}N_2O_2)_2,H_2SO_4$.

Calculate the content of dihydroquinidine sulphate by subtracting the result from the assay result.

Other cinchona alkaloids. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in 5 ml of the mobile phase. Heat gently, if necessary to dissolve the powder as completely as possible, cool, dilute to 10 ml with the mobile phase and mix.

Reference solution (a). Dissolve 20 mg of *quinine sulphate RS*, with gentle heating if necessary, in 5 ml of the mobile phase and dilute to 10 ml with the mobile phase.

Reference solution (b). Prepare in the same manner as reference solution (a) but using *quinidine sulphate RS* in place of *quinine sulphate RS*.

Reference solution (c). Mix equal volumes of reference solutions (a) and (b).

Reference solution (d). Dilute 1 volume of reference solution (a) to 10 volumes with the mobile phase and dilute 1 volume of the resulting solution to 50 volumes with the mobile phase.

Reference solution (e). A solution containing 0.1 per cent w/v of *thiourea* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS 5 µm),
- mobile phase: a solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* and 3.0 g of *hexylamine* in 700 ml of *water*, adjusting the pH to 2.8 with *1 M orthophosphoric acid*, adding 60 ml of *acetonitrile* and diluting to 1000 ml with *water*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 250 nm for reference solution (e) and 316 nm for the other solutions,
- injection volume. 10 µl.

Inject separately reference solutions (b) and (e). If necessary, adjust the concentration of acetonitrile in the mobile phase so that in the chromatogram obtained with reference solution (b) the capacity factor of the peak due to quinidine is 3.5 to 4.5, V_0 (the distance along the baseline between the point of injection and the perpendicular dropped from the maximum of the peak of an unretained component) being calculated from the peak due to thiourea in the chromatogram obtained with reference solution (e).

Inject reference solutions (a), (b), (c) and (d). The chromatogram obtained with reference solution (a) shows a principal peak due to quinine and a peak due to dihydroquinine with a retention time relative to quinine of about 1.4. The chromatogram obtained with reference solution (b) shows a principal peak due to quinidine and a peak due to dihydroquinidine, with a retention time relative to quinidine of about 1.2. The chromatogram obtained with reference solution (c) shows four peaks due to quinine, dihydroquinine, quinidine and dihydroquinidine which are identified by comparison of their retention times with those of the corresponding peaks in the chromatograms obtained with reference solutions (a) and (b).

The test is not valid unless (a) in the chromatogram obtained with reference solution (c) the resolution between the peaks due to quinine and quinidine is at least 1.5 and the resolution between the peaks due to dihydroquinidine and quinine is at least 1.0 and (b) the signal-to-noise ratio of the principal peak in the chromatogram obtained with reference solution (d) is at least 5.

Inject the test solution and allow the chromatography to proceed for 2.5 times the retention time of the principal peak. Calculate the percentage content of related substances by normalisation, ignoring any peaks the areas of which are less than that of the peak in the chromatogram obtained with reference solution (d) (0.2 per cent). The content of dihydroquinidine is not greater than 15 per cent, the content of any related substance eluting before quinidine is not greater than 5 per cent and the content of any other related substance is not greater than 2.5 per cent.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). 3.0 per cent to 5.0 per cent, determined on 1.0 g by drying in an oven at 130°.

Assay. Weigh accurately about 0.2 g, dissolve in a mixture of 10 ml of *chloroform* and 20 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02490 g of $(C_{20}H_{24}N_2O_2)_2,H_2SO_4$.

Storage. Store protected from light.

Quinidine Tablets

Quinidine Sulphate Tablets

Quinidine Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of quinidine sulphate, $(C_{20}H_{24}N_2O_2)_2,H_2SO_4,2H_2O$.

Usual strength. 200 mg.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 80 volumes of *toluene*, 20 volumes of *acetone* and 10 volumes of *diethylamine*.

Test solution. Extract a quantity of the powdered tablets containing 0.1 g of Quinidine Sulphate with 10 ml of a mixture of 2 volumes of *chloroform* and 1 volume of *ethanol (95 per cent)* and filter.

Reference solution. 1.0 per cent w/v solution of *quinidine sulphate RS* in a mixture of 2 volumes of *chloroform* and 1 volume of *ethanol (95 per cent)*.

Apply to the plate 2 µl of each solution. After development, dry the plate in air and spray with *0.05 M ethanolic sulphuric acid* and then with *dilute potassium iodobismuthate solution*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. Extract a quantity of the powdered tablets containing 0.1 g of Quinidine Sulphate with 20 ml of *water* and filter. The filtrate (solution A) is dextro-rotatory.

C. To 1 ml of solution A add 4 ml of *water*, 2 or 3 drops of *bromine solution* and 1 ml of *dilute ammonia solution*; an emerald green colour is produced.

D. Solution A gives the reactions of sulphates (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 2,
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted if necessary, at the maximum at about 248 nm (2.4.7). Calculate the content of $(C_{20}H_{24}N_2O_2)_2,H_2SO_4,2H_2O$ in the medium from the absorbance obtained from a solution of known concentration of *quinidine sulphate RS.*

D. Not less than 70 per cent of the stated amount of $(C_{20}H_{24}N_2O_2)_2,H_2SO_4,2H_2O$.

Other cinchona alkaloids. Determine by liquid chromatography (2.4.14).

Test solution. Mix a quantity of the powdered tablets containing 50 mg of Quinidine Sulphate with 20 ml of the mobile phase. Heat gently to dissolve the powder as completely as possible, cool, dilute to 25 ml with the mobile phase and filter, discarding the first few ml of filtrate.

Reference solution (a). Dissolve 20 mg of *quinine sulphate RS*, with gentle heating if necessary, in 5 ml of the mobile phase and dilute to 10 ml with the mobile phase.

Reference solution (b). Prepare in the same manner as reference solution (a) but using *quinidine sulphate RS* in place of *quinine sulphate RS.*

Reference solution (c). Mix equal volumes of reference solutions (a) and (b).

Reference solution (d). Dilute 1 volume of reference solution (a) to 10 volumes with the mobile phase and dilute 1 volume of the resulting solution to 50 volumes with the mobile phase.

Reference solution (e). A solution containing 0.1 per cent w/v of *thiourea* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS 5 µm),
- mobile phase: a solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* and 3.0 g of *hexylamine* in 700 ml of *water,* adjusting the pH to 2.8 with *1 M orthophosphoric acid*, adding 60 ml of *acetonitrile* and diluting to 1000 ml with *water*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 250 nm for reference solution (e) and 316 nm for the other solutions,
- injection volume. 10 µl.

Inject separately reference solutions (b) and (e). If necessary, adjust the concentration of acetonitrile in the mobile phase so that in the chromatogram obtained with reference solution (b) the capacity factor of the peak due to quinidine is 3.5 to 4.5, V_0 (the distance along the baseline between the point of injection and the perpendicular dropped from the maximum of the peak of an unretained component) being calculated from the peak due to thiourea in the chromatogram obtained with reference solution (e).

Inject reference solutions (a), (b), (c) and (d). The chromatogram obtained with reference solution (a) shows a principal peak due to quinine and a peak due to dihydroquinine with a retention time relative to quinine of about 1.4. The chromatogram obtained with reference solution (b) shows a principal peak due to quinidine and a peak due to dihydroquinidine, with a retention time relative to quinidine of about 1.2. The chromatogram obtained with reference solution (c) shows four peaks due to quinine, dihydroquinine, quinidine and dihydroquinidine which are identified by comparison of their retention times with those of the corresponding peaks in the chromatograms obtained with reference solutions (a) and (b).

The test is not valid unless (a) in the chromatogram obtained with reference solution (c) the resolution between the peaks due to quinine and quinidine is at least 1.5 and the resolution between the peaks due to dihydroquinidine and quinine is at least 1.0 and (b) the signal-to-noise ratio of the principal peak in the chromatogram obtained with reference solution (d) is at least 5.

Inject the test solution and allow the chromatography to proceed for 2.5 times the retention time of the principal peak. Calculate the percentage content of related substances by normalisation, ignoring any peaks the areas of which are less than that of the peak in the chromatogram obtained with reference solution (d) (0.2 per cent). The content of dihydroquinidine is not greater than 15 per cent, the content of any related substance eluting before quinidine is not greater than 5 per cent and the content of any other related substance is not greater than 2.5 per cent.

Other tests. Comply with the tests stated under Tablets.

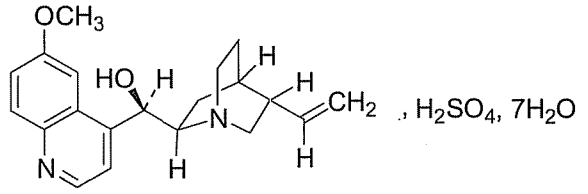
Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 0.4 g of Quinidine Sulphate, dissolve as completely as possible in 40 ml of *acetic anhydride* with the aid of heat and cool. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02610 g of $(C_{20}H_{24}N_2O_2)_2,H_2SO_4,2H_2O$.

Storage. Store protected from light.

Quinine Bisulphate

Quinine Acid Sulphate



$C_{20}H_{24}N_2O_2,H_2SO_4,7H_2O$ Mol. Wt. 548.6

Quinine Bisulphate is (8*S*,9*R*)-6′ -methoxycinchonan-9-ol hydrogen sulphate heptahydrate. The alkaloid is obtained from the bark of various species of *Cinchona*.

Quinine Bisulphate contains not less than 98.5 per cent and not more than 101.5 per cent of alkaloid hydrogen sulphates, calculated as $C_{20}H_{24}N_2O_2,H_2SO_4$ on the anhydrous basis.

Category. Antimalarial.

Dose. Suppressive, 300 to 600 mg daily; therapeutic, 1.2 to 2 g daily, in divided doses.

Description. Colourless or faintly yellow crystals or a white or faintly yellow, crystalline powder; efflorescent in dry air.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 60 volumes of *toluene*, 36 volumes of *ether* and 15 volumes of *diethylamine*.

Test solution. Dissolve 1 g of the substance under examination in 100 ml *methanol*.

Reference solution (a). A 1 per cent w/v solution of *quinine sulphate RS* in *methanol*.

Reference solution (b). A 1 per cent w/v solution of each of *quinidine sulphate RS* and *quinine sulphate RS* in *methanol*.

Apply to the plate 4 µl of each solution. After development, dry the plate in air for 15 minutes and repeat the development. Dry the plate at 105° for 30 minutes, allow to cool and spray with *potassium iodoplatinate solution*. The principal spot in the chromatogram obtained with the test solution corresponds to the spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

B. A 5 per cent w/v solution has a blue fluorescence.

C. A 5 per cent w/v solution gives the reactions of sulphates (2.3.1).

Tests

pH (2.4.24). 2.8 to 3.4, determined in a 1.0 per cent w/v solution.

Specific optical rotation (2.4.22). –208° to –216°, determined at 20° in a 3.0 per cent w/v solution in *0.1 M hydrochloric acid*.

Other cinchona alkaloids. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in 5 ml of the mobile phase. Heat gently, if necessary to dissolve the powder as completely as possible, cool, dilute to 10 ml with the mobile phase and mix.

Reference solution (a). Dissolve 20 mg of *quinine sulphate RS*, with gentle heating if necessary, in 5 ml of the mobile phase and dilute to 10 ml with the mobile phase.

Reference solution (b). Prepare in the same manner as reference solution (a) but using *quinidine sulphate RS* in place of *quinine sulphate RS*.

Reference solution (c). Mix equal volumes of reference solutions (a) and (b).

Reference solution (d). Dilute 1 volume of reference solution (a) to 10 volumes with the mobile phase and dilute 1 volume of the resulting solution to 50 volumes with the mobile phase.

Reference solution (e). A solution containing 0.1 per cent w/v of *thiourea* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS 5 µm),
- mobile phase: a solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* and 3.0 g of *hexylamine* in 700 ml of *water*, adjusting the pH to 2.8 with *1 M orthophosphoric acid*, adding 60 ml of *acetonitrile* and diluting to 1000 ml with *water*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 250 nm for reference solution (e) and 316 nm for the other solutions,
- injection volume. 10 µl.

Inject separately reference solutions (b) and (e). If necessary, adjust the concentration of acetonitrile in the mobile phase so that in the chromatogram obtained with reference solution (b) the capacity factor of the peak due to quinidine is 3.5 to 4.5, V_0 (the distance along the baseline between the point of injection and the perpendicular dropped from the maximum of the peak of an unretained component) being calculated from the peak

due to thiourea in the chromatogram obtained with reference solution (e).

Inject reference solutions (a), (b), (c) and (d). The chromatogram obtained with reference solution (a) shows a principal peak due to quinine and a peak due to dihydroquinine with a retention time relative to quinine of about 1.4. The chromatogram obtained with reference solution (b) shows a principal peak due to quinidine and a peak due to dihydroquinidine, with a retention time relative to quinidine of about 1.2. The chromatogram obtained with reference solution (c) shows four peaks due to quinine, dihydroquinine, quinidine and dihydroquinidine which are identified by comparison of their retention times with those of the corresponding peaks in the chromatograms obtained with reference solutions (a) and (b).

The test is not valid unless (a) in the chromatogram obtained with reference solution (c) the resolution between the peaks due to quinine and quinidine is at least 1.5 and the resolution between the peaks due to dihydroquinidine and quinine is at least 1.0 and (b) the signal-to-noise ratio of the principal peak in the chromatogram obtained with reference solution (d) is at least 5.

Inject the test solution and allow the chromatography to proceed for 2.5 times the retention time of the principal peak. Calculate the percentage content of related substances by normalisation, ignoring any peaks the areas of which are less than that of the peak in the chromatogram obtained with reference solution (d) (0.2 per cent). The content of dihydroquinine is not greater than 10 per cent, the content of any related substance eluting before quinine is not greater than 5 per cent and the content of any other related substance is not greater than 2.5 per cent.

Titratable cation. 75.3 to 79.6 per cent, calculated on the anhydrous basis, determined by the following method. Titrate the combined aqueous solutions reserved in the Assay with *0.1 M hydrochloric acid* using 0.1 ml of *phenolphthalein solution* as indicator.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01632 g of $[C_{20}H_{26}N_2O_2]^{2+}$.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 19.0 to 25.0 per cent, determined on 0.2 g.

Assay. Weigh accurately about 0.45 g, dissolve in 15 ml of *water*, add 25 ml of *0.1 M sodium hydroxide* and extract with three quantities, each of 25 ml, of *chloroform*. Wash each chloroform extract with the same 20 ml of *water*. Combine the aqueous solutions and reserve for the test for Titratable cation. Dry the chloroform extracts with *anhydrous sodium sulphate*, evaporate to dryness at a pressure of 2 kPa and dissolve the residue in 50 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02113 g of $C_{20}H_{24}N_2O_2,H_2SO_4$.

Storage. Store protected from light.

Quinine Bisulphate Tablets

Quinine Acid Sulphate Tablets

Quinine Bisulphate Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of quinine bisulphate, $C_{20}H_{24}N_2O_2,H_2SO_4,7H_2O$. The tablets are coated.

Usual strength. 300 mg.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 80 volumes of *toluene*, 20 volumes of *acetone* and 10 volumes of *diethylamine*.

Test solution. Extract a quantity of the powdered tablets containing 0.1 g of Quinine Bisulphate with 10 ml of a mixture of 2 volumes of *chloroform* and 1 volume of *ethanol (95 per cent)* and filter.

Reference solution. A 1.0 per cent w/v solution of *quinine sulphate* in the same solvent mixture.

Apply to the plate 2 µl of each solution. After development, dry the plate in air and spray with *0.05 M ethanolic sulphuric acid* and then with *dilute potassium iodobismuthate solution*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. Extract a quantity of the powdered tablets containing 0.1 g of Quinine Bisulphate with 20 ml of *water* and filter (solution A). To 5 ml of solution A add 0.2 ml of *bromine solution* and 1 ml of *dilute ammonia solution*; an emerald-green colour is produced.

C. Solution A is *levo-rotatory*.

D. Solution A gives the reactions of sulphates (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 2,
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted if necessary, at the maximum at about 348 nm (2.4.7). Calculate the content of

$C_{20}H_{24}N_2O_2,H_2SO_4,7H_2O$ in the medium taking 99 as the specific absorbance at 348 nm.

D. Not less than 70 per cent of the stated amount of $C_{20}H_{24}N_2O_2,H_2SO_4,7H_2O$.

Other cinchona alkaloids. Determine by liquid chromatography (2.4.14).

Test solution. Remove any coating from the tablets and mix a quantity of the powdered tablet cores containing 50 mg of Quinine Bisulphate with 20 ml of the mobile phase. Heat gently to dissolve the powder as completely as possible, cool, dilute to 25 ml with the mobile phase and filter, discarding the first few ml of the filtrate.

Reference solution (a). Dissolve 20 mg of *quinine sulphate RS*, with gentle heating if necessary, in 5 ml of the mobile phase and dilute to 10 ml with the mobile phase.

Reference solution (b). Prepare in the same manner as reference solution (a) but using *quinidine sulphate RS* in place of *quinine sulphate RS*.

Reference solution (c). Mix equal volumes of reference solutions (a) and (b).

Reference solution (d). Dilute 1 volume of reference solution (a) to 10 volumes with the mobile phase and dilute 1 volume of the resulting solution to 50 volumes with the mobile phase.

Reference solution (e). A solution containing 0.1 per cent w/v of *thiourea* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS 5 µm),
- mobile phase: a solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* and 3.0 g of *hexylamine* in 700 ml of *water*, adjusting the pH to 2.8 with *1 M orthophosphoric acid*, adding 60 ml of *acetonitrile* and diluting to 1000 ml with *water*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 250 nm for reference solution (e) and 316 nm for the other solutions,
- injection volume. 10 µl.

Inject separately reference solutions (b) and (e). If necessary, adjust the concentration of acetonitrile in the mobile phase so that in the chromatogram obtained with reference solution (b) the capacity factor of the peak due to quinidine is 3.5 to 4.5, V_0 (the distance along the baseline between the point of injection and the perpendicular dropped from the maximum of the peak of an unretained component) being calculated from the peak due to thiourea in the chromatogram obtained with reference solution (e).

Inject reference solutions (a), (b), (c) and (d). The chromatogram obtained with reference solution (a) shows a principal peak due to quinine and a peak due to dihydroquinine with a retention time relative to quinine of about 1.4. The chromatogram obtained with reference solution (b) shows a principal peak due to quinidine and a peak due to dihydroquinidine, with a retention time relative to quinidine of about 1.2. The chromatogram obtained with reference solution (c) shows four peaks due to quinine, dihydroquinine, quinidine and dihydroquinidine which are identified by comparison of their retention times with those of the corresponding peaks in the chromatograms obtained with reference solutions (a) and (b).

The test is not valid unless (a) in the chromatogram obtained with reference solution (c) the resolution between the peaks due to quinine and quinidine is at least 1.5 and the resolution between the peaks due to dihydroquinidine and quinine is at least 1.0 and (b) the signal-to-noise ratio of the principal peak in the chromatogram obtained with reference solution (d) is at least 5.

Inject the test solution and allow the chromatography to proceed for 2.5 times the retention time of the principal peak. Calculate the percentage content of related substances by normalisation, ignoring any peaks the areas of which are less than that of the peak in the chromatogram obtained with reference solution (d) (0.2 per cent). The content of dihydroquinine is not greater than 10 per cent, the content of any related substance eluting before quinine is not greater than 5 per cent and the content of any other related substance is not greater than 2.5 per cent.

Other tests. Comply with the tests stated under Tablets.

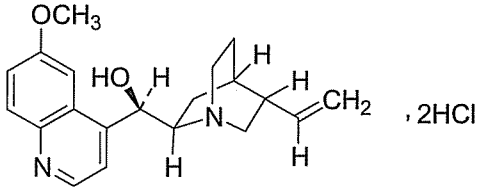
Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 0.6 g of Quinine Bisulphate, dissolve as completely as possible in 40 ml of *acetic anhydride* with the aid of heat and cool. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.05486 g of $C_{20}H_{24}N_2O_2,H_2SO_4,7H_2O$.

Storage. Store protected from light.

Quinine Dihydrochloride

Quinine Acid Hydrochloride



$C_{20}H_{24}N_2O_2,2HCl$ Mol. Wt. 397.3

Quinine Dihydrochloride is the (8*S*,9*R*)-6′–methoxycinchonan-9-ol dihydrochloride. The alkaloid is obtained from the bark of various species of *Cinchona*.

Quinine Dihydrochloride contains not less than 99.0 per cent and not more than 101.5 per cent of alkaloid dihydrochlorides, calculated as $C_{20}H_{24}N_2O_2,2HCl$ on the dried basis.

Category. Antimalarial.

Dose. Suppressive, 300 to 600 mg daily; therapeutic, 1.2 to 2 g daily, in divided doses. By slow intravenous injection, 300 to 600 mg.

Description. A white or almost white powder; odourless.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 60 volumes of *toluene*, 36 volumes of *ether* and 15 volumes of *diethylamine*.

Test solution. Dissolve 1 g of the substance under examination in 100 ml of *methanol*.

Reference solution (a). A 1 per cent w/v solution of *quinine sulphate RS* in *methanol*.

Reference solution (b). A 1 per cent w/v solution of each of *quinidine sulphate RS* and *quinine sulphate RS* in *methanol*.

Apply to the plate 4 µl of each solution. After development, dry the plate in air for 15 minutes and repeat the development. Dry the plate at 105° for 30 minutes, allow to cool and spray with *potassium iodoplatinate solution*. The principal spot in the chromatogram obtained with the test solution corresponds to the spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

B. To a 0.5 per cent w/v solution add an equal volume of *dilute sulphuric acid*; a strong blue fluorescence is produced.

C. A 1 per cent w/v solution gives the reactions of chlorides (2.3.1).

Tests

pH (2.4.24). 2.0 to 3.0, determined in a 3.0 per cent w/v solution.

Specific optical rotation (2.4.22). –223° to –229°, determined in a 3.0 per cent w/v solution in *0.1 M hydrochloric acid*.

Barium. To 15 ml of a 2 per cent w/v solution add 1 ml of *dilute sulphuric acid*; the solution remains clear for at least 15 minutes.

Dihydroquinine dihydrochloride. Not more than 10.0 per cent, calculated on the dried basis and determined by the following method. Dissolve 0.2 g in 20 ml of *water*, add 0.5 g of *potassium bromide* and 15 ml of *2 M hydrochloric acid*. Titrate slowly with *0.0167 M potassium bromate* using *methyl red solution* as indicator until a yellow colour is obtained. Add a solution of 0.5 g of *potassium iodide* in 200 ml of *water* and stopper the flask immediately. Allow to stand in the dark for 5 minutes and titrate with *0.1 M sodium thiosulphate* using *starch solution*, added towards the end of the titration, as indicator. Repeat the operation without the substance under examination.

1 ml of *0.0167 M potassium bromate* is equivalent to 0.01987 g of $C_{20}H_{24}N_2O_2,2HCl$. Calculate the content of dihydroquinine dihydrochloride by subtracting the result from the assay result.

Other cinchona alkaloids. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in 5 ml of the mobile phase. Heat gently, if necessary to dissolve the powder as completely as possible, cool, dilute to 10 ml with the mobile phase and mix.

Reference solution (a). Dissolve 20 mg of *quinine sulphate RS*, with gentle heating if necessary, in 5 ml of the mobile phase and dilute to 10 ml with the mobile phase.

Reference solution (b). Prepare in the same manner as reference solution (a) but using *quinidine sulphate RS* in place of *quinine sulphate RS*.

Reference solution (c). Mix equal volumes of reference solutions (a) and (b).

Reference solution (d). Dilute 1 volume of reference solution (a) to 10 volumes with the mobile phase and dilute 1 volume of the resulting solution to 50 volumes with the mobile phase.

Reference solution (e). A solution containing 0.1 per cent w/v of *thiourea* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS 5 µm),
- mobile phase: a solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* and 3.0 g of *hexylamine* in 700 ml of *water*, adjusting the pH to 2.8 with *1 M orthophosphoric acid*, adding 60 ml of *acetonitrile* and diluting to 1000 ml with *water*
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 250 nm for reference solution (e) and 316 nm for the other solutions,
- injection volume. 10 µl.

Inject separately reference solutions (b) and (e). If necessary, adjust the concentration of acetonitrile in the mobile phase so that in the chromatogram obtained with reference solution (b) the capacity factor of the peak due to quinidine is 3.5 to 4.5, V_0

(the distance along the baseline between the point of injection and the perpendicular dropped from the maximum of the peak of an unretained component) being calculated from the peak due to thiourea in the chromatogram obtained with reference solution (e).

Inject reference solutions (a), (b), (c) and (d). The chromatogram obtained with reference solution (a) shows a principal peak due to quinine and a peak due to dihydroquinine with a retention time relative to quinine of about 1.4. The chromatogram obtained with reference solution (b) shows a principal peak due to quinidine and a peak due to dihydroquinidine, with a retention time relative to quinidine of about 1.2. The chromatogram obtained with reference solution (c) shows four peaks due to quinine, dihydroquinine, quinidine and dihydroquinidine which are identified by comparison of their retention times with those of the corresponding peaks in the chromatograms obtained with reference solutions (a) and (b).

The test is not valid unless (a) in the chromatogram obtained with reference solution (c) the resolution between the peaks due to quinine and quinidine is at least 1.5 and the resolution between the peaks due to dihydroquinidine and quinine is at least 1.0 and (b) the signal-to-noise ratio of the principal peak in the chromatogram obtained with reference solution (d) is at least 5.

Inject the test solution and allow the chromatography to proceed for 2.5 times the retention time of the principal peak. Calculate the percentage content of related substances by normalisation, ignoring any peaks the areas of which are less than that of the peak in the chromatogram obtained with reference solution (d) (0.2 per cent). The content of dihydroquinine is not greater than 10 per cent, the content of any related substance eluting before quinine is not greater than 5 per cent and the content of any other related substance is not greater than 2.5 per cent.

Titratable cation. 79.7 to 84.2 per cent, calculated on the dried basis, determined by the following method. Weigh accurately about 0.4 g, dissolve in 10 ml of *water*, add 40 ml of *methanol* and titrate with *0.1 M sodium hydroxide* using *phenolphthalein solution* as indicator.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01632 g of $[C_{20}H_{26}N_2O_2]^{2+}$.

Sulphates (2.3.17). 0.125 g complies with the limit test for sulphates (0.12 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 3.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.3 g, dissolve in 50 ml of *anhydrous glacial acetic acid* and add 20 ml of *acetic anhydride* and 10 ml of *mercuric acetate* solution. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent of 0.01987 g of $C_{20}H_{24}N_2O_2,2HCl$.

Storage. Store protected from light.

Quinine Dihydrochloride Injection

Quinine Acid Hydrochloride Injection

Quinine Dihydrochloride Injection is a sterile solution of Quinine Dihydrochloride in Water for Injections.

Quinine Dihydrochloride Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of quinine dihydrochloride, $C_{20}H_{24}N_2O_2,2HCl$.

Usual strength. 300 mg per ml.

Description. A clear, almost colourless to light yellow solution.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 80 volumes of *toluene*, 20 volumes of *acetone* and 10 volumes of *diethylamine*.

Solvent mixture. 2 volumes of *chloroform* and 1 volume of *ethanol (95 per cent)*.

Test solution. Extract a volume of the injection containing 0.1 g of Quinine Dihydrochloride Bisulphate with 10 ml of the solvent mixture and filter.

Reference solution (a). A 1 per cent w/v solution of *quinine sulphate RS* in the solvent mixture.

Reference solution (b). A solution of 1 per cent w/v of each of *quinidine sulphate RS* and *quinine sulphate RS* in the solvent mixture.

Apply to the plate 2 µl of each solution. After development, dry the plate in air and spray with *0.05 M ethanolic sulphuric acid* and then with *dilute potassium iodobismuthate solution*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

B. Dilute 1 ml to 20 ml with *water*, add *0.1 M sodium hydroxide* dropwise until the solution becomed turbid. Add 1 or 2 drops

of *0.05 M sulphuric acid* to obtain a clear solution. To this solution add an equal volume of *dilute sulphuric acid*; a strong blue fluorescence is produced.

C. It gives the reactions of chlorides (2.3.1).

Tests

pH (2.4.24).1.5 to 3.0.

Other cinchona alkaloids. Determine by liquid chromatography (2.4.14).

Test solution. Dilute, if necessary a suitable volume of the injection with the mobile phase to produce a solution containing 0.2 per cent w/v of Quinine Dihydrochloride.

Reference solution (a). Dissolve 20 mg of *quinine sulphate RS*, with gentle heating if necessary, in 5 ml of the mobile phase and dilute to 10 ml with the mobile phase.

Reference solution (b). Prepare in the same manner as reference solution (a) but using *quinidine sulphate RS* in place of *quinine sulphate RS*.

Reference solution (c). Mix equal volumes of reference solutions (a) and (b).

Reference solution (d). Dilute 1 volume of reference solution (a) to 10 volumes with the mobile phase and dilute 1 volume of the resulting solution to 50 volumes with the mobile phase.

Reference solution (e). A solution containing 0.1 per cent w/v of *thiourea* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS 5 µm),
- mobile phase: a solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* and 3.0 g of *hexylamine* in 700 ml of *water*, adjusting the pH to 2.8 with *1 M orthophosphoric acid*, adding 60 ml of *acetonitrile* and diluting to 1000 ml with *water*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 250 nm for reference solution (e) and 316 nm for the other solutions,
- injection volume. 10 µl.

Inject separately reference solutions (b) and (e). If necessary, adjust the concentration of acetonitrile in the mobile phase so that in the chromatogram obtained with reference solution (b) the capacity factor of the peak due to quinidine is 3.5 to 4.5, V_0 (the distance along the baseline between the point of injection and the perpendicular dropped from the maximum of the peak of an unretained component) being calculated from the peak due to thiourea in the chromatogram obtained with reference solution (e).

Inject reference solutions (a), (b), (c) and (d). The chromatogram obtained with reference solution (a) shows a principal peak due to quinine and a peak due to dihydroquinine with a retention time relative to quinine of about 1.4. The chromatogram obtained with reference solution (b) shows a principal peak due to quinidine and a peak due to dihydroquinidine, with a retention time relative to quinidine of about 1.2. The chromatogram obtained with reference solution (c) shows four peaks due to quinine, dihydroquinine, quinidine and dihydroquinidine which are identified by comparison of their retention times with those of the corresponding peaks in the chromatograms obtained with reference solutions (a) and (b).

The test is not valid unless (a) in the chromatogram obtained with reference solution (c) the resolution between the peaks due to quinine and quinidine is at least 1.5 and the resolution factor between the peaks due to dihydroquinidine and quinine is at least 1.0 and (b) the signal-to-noise ratio of the principal peak in the chromatogram obtained with reference solution (d) is at least 5.

Inject the test solution and allow the chromatography to proceed for 2.5 times the retention time of the principal peak. Calculate the percentage content of related substances by normalisation, ignoring any peaks the areas of which are less than that of the peak in the chromatogram obtained with reference solution (d) (0.2 per cent). The content of dihydroquinine is not greater than 10 per cent, the content of any related substance eluting before quinine is not greater than 5 per cent and the content of any other related substance is not greater than 2.5 per cent.

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

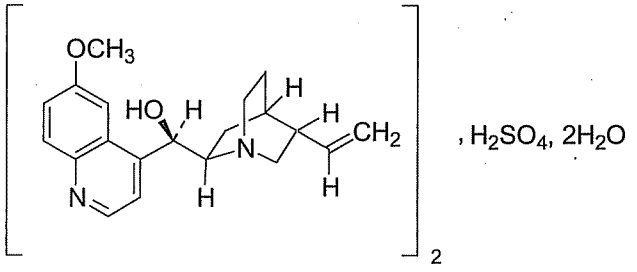
Assay. To an accurately measured volume containing about 0.5 g of Quinine Dihydrochloride add 20 ml of *water* and 5 ml of *sodium hydroxide solution*. Extract with successive quantities, each of 10 ml, of *chloroform* until complete extraction of the alkaloid is effected, washing each extract with the same two quantities, each of 5 ml, of *water*. Remove the chloroform from the combined extracts, dissolve the residue in 50 ml of *anhydrous glacial acetic acid* and add 20 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01987 g of $C_{20}H_{24}N_2O_2,2HCl$.

Storage. Store protected from light.

Labelling. The label states that the solution must be diluted to a strength not exceeding 30 mg per ml before administration and that care should be taken to ensure slow intravenous injection.

Quinine Sulphate



$(C_{20}H_{24}N_2O_2)_2,H_2SO_4,2H_2O$ Mol. Wt.783.0

Quinine Sulphate is (8*S*,9*R*)-6′ -methoxycinchonan-9-ol sulphate dihydrate. The alkaloid is obtained from the bark of various species of *Cinchona*.

Quinine Sulphate contains not less than 99.0 per cent and not more than 101.0 per cent of alkaloid monosulphates, calculated as $(C_{20}H_{24}N_2O_2)_2,H_2SO_4$ on the dried basis.

Category. Antimalarial.

Dose. Suppressive, 300 to 600 mg daily. therapeutic, 1.2 to 2 g daily, in divided doses.

Description. White or almost white, needle-like crystals or a crystalline powder.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 40 volumes of *toluene*, 24 volumes of *ether* and 10 volumes of *diethylamine*.

Test solution. Dissolve 1 g of the substance under examination in 100 ml of *methanol*.

Reference solution. A 1 per cent w/v solution of *quinine sulphate RS* in *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air for 15 minutes and repeat the development. Dry the plate at 105° for 30 minutes, allow to cool and spray with *potassium iodoplatinate solution*. The principal spot in the chromatogram obtained with the test solution corresponds to the spot in the chromatogram obtained with the reference solution.

B. To 5 ml of a 0.1 per cent w/v solution add 0.2 ml of *bromine solution* and 1 ml of *dilute ammonia solution*; an emerald-green colour is produced.

C. To a 0.5 per cent w/v solution add an equal volume of *dilute sulphuric acid*; a strong blue fluorescence is produced.

D. To 5 ml of a 1 per cent w/v solution add 1 ml of *silver nitrate solution* and stir with a glass rod; after a short interval, a white precipitate soluble in *nitric acid* is produced (distinction from many other alkaloids).

E. A 1 per cent w/v solution gives the reactions of sulphates (2.3.1).

Tests

Appearance of solution. A 2.0 per cent w/v solution in *0.1 M hydrochloric acid* is clear (2.4.1), and not more intensely coloured than reference solution GYS4 (2.4.1).

pH (2.4.24). 5.7 to 6.6, determined in a 1.0 per cent w/v suspension in *water*.

Specific optical rotation (2.4.22). –237° to –245°, determined in a 2.0 per cent w/v solution in *0.1 M hydrochloric acid*.

Other cinchona alkaloids. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in 5 ml of the mobile phase. Heat gently, if necessary to dissolve the powder as completely as possible, cool, dilute to 10 ml with the mobile phase and mix.

Reference solution (a). Dissolve 20 mg of *quinine sulphate RS*, with gentle heating if necessary, in 5 ml of the mobile phase and dilute to 10 ml with the mobile phase.

Reference solution (b). Prepare in the same manner as reference solution (a) but using *quinidine sulphate RS* in place of *quinine sulphate RS*.

Reference solution (c). Mix equal volumes of reference solutions (a) and (b).

Reference solution (d). Dilute 1 volume of reference solution (a) to 10 volumes with the mobile phase and dilute 1 volume of the resulting solution to 50 volumes with the mobile phase.

Reference solution (e). A solution containing 0.1 per cent w/v of *thiourea* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS 5 µm),
- mobile phase: a solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* and 3.0 g of *hexylamine* in 700 ml of *water*, adjusting the pH to 2.8 with *1 M orthophosphoric acid*, adding 60 ml of *acetonitrile* and diluting to 1000 ml with *water*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 250 nm for reference solution (e) and 316 nm for the other solutions,
- injection volume. 10 µl.

Inject separately reference solutions (b) and (e). If necessary, adjust the concentration of acetonitrile in the mobile phase so that in the chromatogram obtained with reference solution (b) the capacity factor of the peak due to quinidine is 3.5 to 4.5, V_0 (the distance along the baseline between the point of injection and the perpendicular dropped from the maximum of the peak of an unretained component) being calculated from the peak due to thiourea in the chromatogram obtained with reference solution (e).

Inject reference solutions (a), (b), (c) and (d). The chromatogram obtained with reference solution (a) shows a principal peak due to quinine and a peak due to dihydroquinine with a retention time relative to quinine of about 1.4. The chromatogram obtained with reference solution (b) shows a principal peak due to quinidine and a peak due to dihydroquinidine, with a retention time relative to quinidine of about 1.2. The chromatogram obtained with reference solution (c) shows four peaks due to quinine, dihydroquinine, quinidine and dihydroquinidine which are identified by comparison of their retention times with those of the corresponding peaks in the chromatograms obtained with solutions (a) and (b).

The test is not valid unless (a) in the chromatogram obtained with reference solution (c) the resolution between the peaks due to quinine and quinidine is at least 1.5 and the resolution between the peaks due to dihydroquinidine and quinine is at least 1.0 and (b) the signal-to-noise ratio of the principal peak in the chromatogram obtained with reference solution (d) is at least 5.

Inject the test solution and allow the chromatography to proceed for 2.5 times the retention time of the principal peak. Calculate the percentage content of related substances by normalisation, ignoring any peaks the areas of which are less than that of the peak in the chromatogram obtained with reference solution (d) (0.2 per cent). The content of dihydroquinine is not greater than 10 per cent, the content of any related substance eluting before quinine is not greater than 5 per cent and the content of any other related substance is not greater than 2.5 per cent.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). 3.0 to 5.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.2 g, dissolve in a mixture of 10 ml of *chloroform* and add 20 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02490 g of $(C_{20}H_{24}N_2O_2)_2,H_2SO_4$.

Storage. Store protected from light.

Quinine Tablets

Quinine Sulphate Tablets

Quinine Sulphate Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of quinine sulphate, $(C_{20}H_{24}N_2O_2)_2,H_2SO_4,2H_2O$. The tablets are coated.

Usual strengths. 100 mg; 300 mg.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 80 volumes of toluene, *20 volumes of* acetone *and 10 volumes of* diethylamine.

Test solution. Extract a quantity of the powdered tablets containing 0.1 g of Quinine Sulphate with 10 ml of a mixture of 2 volumes of *chloroform* and 1 volume of *ethanol (95 per cent)* and filter.

Reference solution. A 1 per cent w/v solution of *quinine sulphate* in the same solvent mixture.

Apply to the plate 2 µl of each solution. After development, dry the plate in air and spray with *0.05 M ethanolic sulphuric acid* and then with *dilute potassium iodobismuthate solution*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. Extract a quantity of the powdered tablets containing 0.1 g of Quinine Sulphate with 20 ml of *water* and filter (solution A). To 5 ml of solution A add 0.2 ml of *bromine solution* and 1 ml of *dilute ammonia solution*; an emerald-green colour is produced.

C. Solution A is *levo-rotatory*.

D. Solution A gives the reactions of sulphates (2.3.1).

Tests

Dissolution (2.5.2).

Apparatus No. 2,
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtrate, suitably diluted if necessary, at the maximum at about 348 nm (2.4.7). Calculate the content of $C_{20}H_{24}N_2O_2$, H_2SO_4, $2H_2O$ in the medium from a solution of known concentration of *quinine sulphate RS*.

D. Not less than 70 per cent of the stated amount of $C_{20}H_{24}N_2O_2$, H_2SO_4, $2H_2O$.

Other cinchona alkaloids. Determine by liquid chromatography (2.4.14).

Test solution. Remove any coating from the tablets and mix a quantity of the powdered tablet cores containing 50 mg of Quinine Sulphate with 20 ml of the mobile phase. Heat gently to dissolve the powder as completely as possible, cool, dilute to 25 ml with the mobile phase and filter, discarding the first few ml of the filtrate.

Reference solution (a). Dissolve 20 mg of *quinine sulphate RS*, with gentle heating if necessary, in 5 ml of the mobile phase and dilute to 10 ml with the mobile phase.

Reference solution (b). Prepare in the same manner as reference solution (a) but using *quinidine sulphate RS* in place of *quinine sulphate RS.*

Reference solution (c). Mix equal volumes of reference solutions (a) and (b).

Reference solution (d). Dilute 1 volume of reference solution (a) to 10 volumes with the mobile phase and dilute 1 volume of the resulting solution to 50 volumes with the mobile phase.

Reference solution (e). A solution containing 0.1 per cent w/v of *thiourea* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (Such as Hypersil ODS 5 µm),
- mobile phase: a solution prepared by dissolving 6.8 g of *potassium dihydrogen orthophosphate* and 3.0 g of *hexylamine* in 700 ml of *water,* adjusting the pH to 2.8 with *1 M orthophosphoric acid*, adding 60 ml of *acetonitrile* and diluting to 1000 ml with *water,*
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 250 nm for reference solution (e) and 316 nm for the other solutions,
- injection volume. 10 µl.

Inject separately reference solutions (b) and (e). If necessary, adjust the concentration of acetonitrile in the mobile phase so that in the chromatogram obtained with reference solution (b) the capacity factor of the peak due to quinidine is 3.5 to 4.5, V_0 (the distance along the baseline between the point of injection and the perpendicular dropped from the maximum of the peak of an unretained component) being calculated from the peak due to thiourea in the chromatogram obtained with reference solution (e).

Inject reference solutions (a), (b), (c) and (d). The chromatogram obtained with reference solution (a) shows a principal peak due to quinine and a peak due to dihydroquinine with a retention time relative to quinine of about 1.4. The chromatogram obtained with reference solution (b) shows a principal peak due to quinidine and a peak due to dihydroquinidine, with a retention time relative to quinidine of about 1.2. The chromatogram obtained with reference solution (c) shows four peaks due to quinine, dihydroquinine, quinidine and dihydroquinidine which are identified by comparison of their retention times with those of the corresponding peaks in the chromatograms obtained with reference solutions (a) and (b).

The test is not valid unless (a) in the chromatogram obtained with reference solution (c) the resolution between the peaks due to quinine and quinidine is at least 1.5 and the resolution between the peaks due to dihydroquinidine and quinine is at least 1.0 and (b) the signal-to-noise ratio of the principal peak in the chromatogram obtained with reference solution (d) is at least 5.

Inject the test solution and allow the chromatography to proceed for 2.5 times the retention time of the principal peak. Calculate the percentage content of related substances by normalisation, ignoring any peaks the areas of which are less than that of the peak in the chromatogram obtained with reference solution (d) (0.2 per cent). The content of dihydroquinine is not greater than 10 per cent, the content of any related substance eluting before quinine is not greater than 5 per cent and the content of any other related substance is not greater than 2.5 per cent.

Other tests. Comply with the tests stated under Tablets.

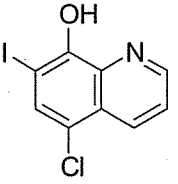
Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 0.4 g of Quinine Sulphate, dissolve as completely as possible in 40 ml of *acetic anhydride* with the aid of heat and cool. Filter, if necessary through Whatman No.1 filter paper and rinse with an additional 40 ml of *acetic anhydride* in small volumes. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02610 g of $(C_{20}H_{24}N_2O_2)_2,H_2SO_4,2H_2O$.

Storage. Store protected from light.

Quiniodochlor

Clioquinol; Iodochlorhydroxyquinoline; Iodochlorhydroxyquin



C_9H_5ClINO Mol. Wt. 305.5

Quiniodochlor is 5-chloro-7-iodoquinolin-8-ol.

Quiniodochlor contains not less than 97.0 per cent and not more than 103.0 per cent of C_9H_5ClINO, calculated on the dried basis.

Category. Antiamoebic; topical and intestinal antiseptic.

Dose. 750 mg to 1.5 g daily, in divided doses.

Description. A yellowish white to brownish yellow powder; odour, faint and characteristic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *quiniodochlor RS* or with the reference spectrum of quiniodochlor.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.0005 per cent w/v solution in *3 M hydrochloric acid* shows an absorption maximum at about 267 nm.

C. Burn 20 mg by the oxygen-flask method (2.3.34), using 5 ml of *2 M sodium hydroxide* as the absorbing liquid and dilute to 25 ml with *water*. To 5 ml add 1 ml of *silver nitrate solution*; a yellow precipitate is produced. Add 5 ml of *5 M ammonia*, shake, filter and acidify the filtrate with *nitric acid*; a white precipitate is produced.

Tests

Acidity or alkalinity. Shake 0.5 g with 10 ml of *water* previously neutralised to *phenolphthalein solution*. The solution is colourless and not more than 0.05 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution to pink.

Free iodine. Shake 1.0 g with a solution of 1 g of *potassium iodide* in 20 ml of *water* for 30 seconds, allow to stand for 5 minutes and filter. To 10 ml of the filtrate add 1 ml of *1 M sulphuric acid* and 2 ml of *chloroform* and shake. Any colour in the chloroform layer is discharged on the addition of 0.1 ml of *0.005 M sodium thiosulphate*.

Halide ions. Shake 0.5 g with 25 ml of *water* for 1 minute and filter. To the filtrate add 0.5 ml of *2 M nitric acid* and 0.5 ml of *0.1 M silver nitrate* and allow to stand for 5 minutes. Any opalescence produced is not more intense than that obtained by adding 0.5 ml of *0.1 M silver nitrate* to 25 ml of *water* containing 0.5 ml of *2 M nitric acid* and 0.2 ml of *0.01 M hydrochloric acid* and allowing to stand for 5 minutes.

Related substances. Determine by gas chromatography (2.4.13).

Test solution. Add 0.5 ml of N,O-*bis (trimethylsilyl)acetamide* to 0.5 ml of a solution in *pyridine* containing 0.4 per cent w/v of each of *5-chloro-8- hydroxyquinoline, 5,7-dichloro-8-hydroxy- quinoline* and *5-chloro-7-iodo-8-hydroxyquinoline* and 0.04 per cent w/v of the substance under examination, mix, allow to stand for 15 minutes and add 5 ml of a 0.05 per cent w/v solution of *dibutylphthalate* (internal standard) in *hexane*.

Reference solution (a). Add 0.5 ml of N,O-*bis (trimethylsilyl)acetamide* to a mixture of 0.1 g of the substance under examination and 0.5 ml of *pyridine*, mix, allow to stand for 15 minutes and add 5 ml of *hexane*.

Reference solution (b). Treat a mixture of 0.1 g of the substance under examination and 0.5 ml of *pyridine* as described for the test solution.

Chromatographic system

- a glass column 1.5 m x 4 mm, packed with silanised diatomaceous support (100 to 120 mesh) coated with 3 per cent w/w of methyl silicone gum,
- temperature:
  column.190°,
  inlet port and detector. 240°,
- flame ionisation detector,
- nitrogen as carrier gas.

In the chromatogram obtained with the test solution the peaks following the solvent peak, in order of emergence, are due to (a) 5-chloro-8-hydroxyquinoline, (b) 5,7-dichloro-8-hydroxy-quinoline, (c) the internal standard, (d) quiniodochlor and (e) 5,7-diiodo-8-hydroxyquinoline.

In the chromatogram obtained with reference solution (b) calculate the content of 5-chloro-8-hydroxy-quinoline, 5,7-dichloro-8-hydroxyquinoline and 5,7-diiodo-8-hydroxy-quinoline by reference to the corresponding peaks in the chromatogram obtained with the test solution.

The total content of the named impurities does not exceed 3.0 per cent w/w, the content of any other impurity does not exceed 0.2 per cent w/w and the sum of the contents is not more than 4.0 per cent w/w.

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa for 24 hours.

Assay. Weigh accurately about 0.3 g and dissolve in 25 ml of *anhydrous pyridine*. Titrate with *0.1 M tetrabutylammonium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 0.03055 g of C_9H_5ClINO.

Storage. Store protected from light.

Quiniodochlor Cream

Clioquinol Cream; Iodochlorhydroxyquinoline Cream; Iodochlorhydroxyquin Cream

Quiniodochlor Cream contains Quiniodochlor in a suitable base.

Quiniodochlor Cream contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of quiniodochlor, C_9H_5ClINO.

Usual strength. 4 per cent w/v.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution. The test solution and the reference solution prepared by using 1.0 ml of pyridine instead of the internal standard solution.

B. Weigh accurately a quantity containing about 25 mg of quiniodochlor, in a 100 ml volumetric flask, add 75 ml of 25 per cent v/v solution of *hydrochloric acid*, heat on a steam bath to melt the cream, shake vigorously to extract the quiniodochlor. Cool under running water, and dilute to the volume with the same solvent. Dilute 3.0 ml of the filtrate to 100.0 ml with the same solvent.

When examined in the range 200 nm to 400 nm (2.4.7), the solution shows an absorption maximum at about 267 nm.

Tests

Other tests. Complies with the tests stated under Creams.

Assay. Determine by gas chromatography (2.4.13).

Internal standard solution. A 0.2 per cent w/v solution of *pyrene* in *pyridine*.

Solvent mixture. 80 volumes of *pyridine* and 20 volumes of *n-hexane* .

Test solution. Weigh accurately a quantity containing about 150 mg of quiniodochlor, in a 60-ml separator. Place the separator on its side in a vacuum oven at a pressure of about 10 mm of mercury at 45° for 4 hours. Remove the separator from the oven, allow to cool, add 15 ml of the solvent mixture, insert a polytef stopper, and mix. Transfer the mixture to a 50-ml volumetric flask, and rinse the separator with two 15 ml portions of the solvent mixture, shaking each time for 30 seconds. Transfer both rinsings to the volumetric flask, dilute with the solvent mixture to volume, and mix. Transfer 1.0 ml to a screw-capped glass vial fitted with a septum, add 1.0 ml of *bis(trimethylsilyl)acetamide* and 1.0 ml of internal standard solution, attach the cap, and mix. Heat in a water-bath at 50° for 15 minutes, and cool.

Reference solution. A 0.3 per cent w/v solution of *quiniodochlor RS* in the solvent mixture. Transfer 1.0 ml to a screw-capped glass vial fitted with a septum, add 1.0 ml of *bis(trimethylsilyl)acetamide* and 1.0 ml of internal standard solution, attach the cap, and mix. Heat in a water-bath at 50° for 15 minutes, and cool.

Chromatographic system

- a glass column 1.83 m x 2 mm, packed with 3 per cent liquid phase G3 on 80 to 100-mesh support S1AB,
- temperature:
  column. 165°,
  inlet port 170° and detector 250°,
- flame ionization detector,
- flow rate. 30 ml per minute of helium as the carrier gas.

Inject the reference solution. The test is not valid unless the resolution between the quiniodochlor and the internal standard peaks is not less than 3.0. The relative retention time with reference to pyrene for quiniodochlor is about 0.6.

Inject the test solution and the reference solution.

Calculate the content of C_9H_5ClINO in the Cream.

Storage. Store protected from light and moisture.

Quiniodochlor Ointment

Clioquinol Ointment; Iodochlorhydroxyquinoline Ointment; Iodochlorhydroxyquin Ointment

Quiniodochlor Ointment contains Quiniodochlor in a suitable base.

Quiniodochlor Ointment contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of quiniodochlor, C_9H_5ClINO.

Usual strength. 4 per cent w/v.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution. The test solution and the reference solution prepared by using 1.0 ml of pyridine instead of the internal standard solution.

B. Weigh accurately a quantity containing about 25 mg of quiniodochlor in a 100-ml volumetric flask, add 75 ml of 25 per cent v/v solution of *hydrochloric acid*, heat on steam bath to melt the ointment, shake vigorously to extract the quiniodochlor. Cool under running water, dilute to volume with the same solvent. Filter and dilute 3.0 ml of this solution to 100.0 ml with the same solvent.

When examined in the range 200 nm to 400 nm (2.4.7), the solution shows an absorption maximum at about 267 nm.

Tests

Other tests. Complies with the tests stated under Ointments.

Assay. Determine by gas chromatography (2.4.13).

Internal standard solution. A 0.2 per cent w/v solution of *pyrene* in *pyridine*.

Solvent mixture. 80 volumes of *pyridine* and 20 volumes of *n-hexane* .

Test solution. Transfer an accurately weighed quantity of the ointment, containing about 150 mg of Quiniodochlor, to a suitable conical flask, add 75 ml of *n-hexane*, and mix. Add 15 ml of *dimethylformamide*, and mix for 1 minute. Allow the layers to separate, and transfer the lower layer to a 50-ml volumetric flask, repeat the extraction with separate 15 ml and 10 ml portions of *dimethylformamide*, and transfer the lower layers to the 50-ml volumetric flask. Dilute with *dimethylformamide* to volume, and mix. Transfer 1.0 ml of this solution to a screw-capped glass vial fitted with a septum, and evaporate at about 60° under a stream of nitrogen to dryness. Add 1.0 ml of a mixture of internal standard solution to the residue, add 1.0 ml of *bis(trimethylsilyl)acetamide* and 1.0 ml of internal standard solution, attach the cap, and mix. Heat in a water-bath at 50° for 15 minutes and cool.

Reference solution. A 0.3 per cent w/v solution of *quiniodochlor RS* in the solvent mixture. Transfer 1.0 ml to a screw-capped glass vial fitted with a septum, add 1.0 ml of *bis(trimethylsilyl)acetamide* and 1.0 ml of internal standard solution, attach the cap, and mix. Heat in a water-bath at 50° for 15 minutes, and cool.

Chromatographic system

- a glass column 1.83 m x 2 mm, packed with 3 per cent liquid phase G3 on 80 to 100-mesh support S1AB,
- temperature:
  column. 165°,
  inlet port 170° and detector 250°,
- flame ionization detector,
- flow rate. 30 ml per minute of helium as the carrier gas.

Inject the reference solution. The test is not valid unless the resolution between the quiniodochlor and the internal standard peaks is not less than 3. The relative retention time with reference to pyrene for quiniodochlor is about 0.6.

Inject the test solution and the reference solution.

Calculate the content of C_9H_5ClINO in the Ointment.

Storage. Store protected from light and moisture.

Quiniodochlor Tablets

Clioquinol Tablets; Iodochlorhydroxyquinoline Tablets; Iodochlorhydroxyquin Tablets

Quiniodochlor Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of quiniodochlor, C_9H_5ClINO.

Usual strength. 250 mg.

Identification

Triturate a quantity of the powdered tablets containing about 250 mg of Quiniodochlor with 20 ml of *acetone*, filter and add 20 ml of *water* to the filtrate. Collect the precipitate formed on a filter and dry at 105°. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *quiniodochlor RS* or with the reference spectrum of quiniodochlor.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.0005 per cent w/v solution in *3 M hydrochloric acid* shows an absorption maximum at about 267 nm.

Tests

Disintegration (2.5.1). Maximum time, 30 minutes.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and finely powder 20 tablets. Weigh accurately a quantity of the powder containing 0.125 g of Quiniodochlor, shake with 20 ml of hot *2-methoxyethanol*, decant the hot supernatant liquid through a fine filter. Repeat the extraction with two further quantities, of 20 ml and 10 ml, of *2-methoxyethanol*, combine the filtered extracts and dilute to 50.0 ml with *2-methoxyethanol*. To 5.0 ml of this solution add 1 ml of *water* and sufficient of a mixture of 24 volumes of *2-methoxyethanol* and 6 volumes of *water* to produce 50.0 ml. To 10.0 ml of the solution add 10 ml of *2-methoxyethanol* and 2 ml of a solution prepared by dissolving 0.5 g of *ferric chloride hexahydrate* in 80 ml of *2-methoxyethanol* and adding 0.1 ml of *hydrochloric acid* and sufficient *2-methoxyethanol* to produce 100 ml. Dilute the solution to 25.0 ml with *2-methoxyethanol* and measure the absorbance of the resulting solution at the maximum at about 650 nm (2.4.7), using as blank a solution prepared by treating 10 ml of the aqueous *2-methoxyethanol* in the same manner beginning at the words "add 10 ml of *2-methoxyethanol*.....".

Calculate the content of C_9H_5ClINO from the absorbance obtained using 10.0 ml of a solution prepared in the following manner. Dissolve 0.125 g of *quiniodochlor RS* in sufficient *2-methoxyethanol* to produce 50.0 ml, warming to effect solution; add 1 ml of *water* to 5.0 ml of the solution and add sufficient of the mixture of 24 volumes of *2-methoxyethanol* and 6 volumes of *water* to produce 50.0 ml. Using 10.0 ml of this solution repeat the operation beginning at the words "add 10 ml of *2-methoxyethanol*...."

Storage. Store protected from light.

Quiniodochlor and Hydrocortisone Cream

Clioquinol and Hydrocortisone Cream; Iodochlorhydroxyquinoline and Hydrocortisone Cream; Iodochlorhydroxyquin and Hydrocortisone Cream

Quiniodochlor and Hydrocortisone Cream contains Hydrocortisone and Quiniodochlor in a suitable base.

Quiniodochlor and Hydrocortisone Cream contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of quiniodochlor, C_9H_5ClINO and not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of hydrocortisone, $C_{21}H_{30}O_5$.

Usual Strength. Quiniodochlor 4 per cent w/w and Hydrocortisone 1 per cent w/w.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silanised silica gel G*.

Mobile phase. A mixture of 77 volumes of *dichloromethane*, 15 volumes of *ether*, 8 volumes of *methanol* and 1.2 volumes of *water*.

Test solution. Disperse by warming and shaking, a quantity of the cream containing 2.5 g of Hydrocortisone in 10 ml of *ethanol (95 per cent)*, cool, allow to stand at 0° for 30 minutes, filter and use the filtrate.

Reference solution (a). A 0.25 per cent w/v solution of *hydrocortisone RS* in *ethanol (95 per cent)*.

Reference solution (b). Dissolve 12.5 mg of *hydrocortisone RS* in 5 ml of test solution.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and spray with *alkaline tetrazolium blue solution.* The principal spot in the chromatogram obtained with test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

B. In the Assay, the principal peak in the chromatogram due to hydrocortisone obtained with test solution (b) corresponds to the peak due to hydrocortisone in the chromatogram obtained with reference solution.

C. Fuse a quantity of the cream containing 0.1 g of quiniodochlor with *anhydrous sodium carbonate*, dissolve the fused mass in *water* and acidify with *2 M nitric acid.* Add *silver nitrate solution*; a pale yellow precipitate is produced which is insoluble in *5 M ammonia.* Add *5 M ammonia* until the solution becomes alkaline, boil gently, filter and acidify the filtrate with *2 M nitric acid*; a white precipitate is produced which darkens on exposure to light.

Tests

Other tests. Complies with the tests stated under Creams.

Assay. *For hydrocortisone* — Determine by liquid chromatography (2.4.14).

Test solution (a). Add 30 ml of *2,2,4-trimethylpentane* to a quantity of the cream containing 10 mg of Hydrocortisone and warm on a water-bath until the preparation has melted. Extract the warm mixture with successive quantities of 30, 20 and 20 ml of *methanol (80 per cent)*, combine the aqueous methanolic layers, cool to about 20° and dilute to 100 ml with the same solvent.

Test solution (b). Prepare in the same manner as test solution (a) but adding 10 ml of a 4 per cent v/v solution of *bromobenzene* in *methanol* to the cooled methanolic extract and dilute to 100.0 ml with methanol (80 per cent).

Reference solution. Dissolve 5 mg of *hydrocortisone RS* in 5 ml of a 4 per cent v/v solution of *bromobenzene* (internal standard) in *methanol* and dilute to 50 ml with *methanol (80 per cent).*

Chromatographic system
- a stainless steel column 25 cm x 5 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Spherisorb ODS 1),
- mobile phase: *methanol (65 per cent)*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 242 nm,
- injection volume. 10 µl.

Calculate the content of $C_{21}H_{30}O_5$ in the cream.

For quiniodochlor — Weigh accurately a quantity of the cream containing about 25 mg of quiniodochlor, add 80 ml of a hot mixture of 6 volumes of *water* and 24 volumes of *2-methoxyethanol* and heat on a water-bath for 5 minutes. Cool in ice for 10 minutes, allow to warm to room temperature, dilute to 100 ml with a mixture of 6 volumes of *water* and 24 volumes of *2-methoxyethanol*, mix and filter. To 10 ml of the filtrate, add 10 ml of *2-methoxyethanol* and 2 ml of a solution prepared by dissolving 0.5 g of *iron(III) chloride hexahydrate* in 80 ml of *2-methoxyethanol* and adding 0.1 ml of *hydrochloric acid* and sufficient *2-methoxyethanol* to produce 100 ml. Dilute the solution to 25 ml with *2-methoxyethanol* and measure the absorbance of the resulting solution at the maximum at about 650 nm (2.4.7), using in the reference cell a solution prepared by treating 10 ml of the mixture of 6 volumes of *water* and 24 volumes of *2-methoxyethanol* in the same manner beginning at the words "add 10 ml of *2-methoxyethanol*.....".

Repeat the operation beginning at the words 'add 10 ml of *2-methoxyethanol* using 10 ml of a solution prepared in the following manner. Dissolve 0.125 g of *clioquinol RS* in sufficient *2-methoxyethanol* to produce 50 ml; warming to effect solution; add 1 ml of *water* to 5 ml of the solution and add sufficient of a mixture of 6 volumes of *water* and 24 volumes of *2-methoxyethanol* to produce 50 ml.

Calculate the content of C_9H_5ClINO in the cream.

Storage. Store protected from light.

Quiniodochlor and Hydrocortisone Ointment

Clioquinol and Hydrocortisone Ointment; Iodochlorhydroxyquinoline and Hydrocortisone Ointment; Iodochlorhydroxyquin and Hydrocortisone Ointment

Quiniodochlor and Hydrocortisone Ointment contains Quiniodochlor and Hydrocortisone in a suitable base.

Quiniodochlor and Hydrocortisone Ointment contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of quiniodochlor, C_9H_5ClINO and not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of hydrocortisone, $C_{21}H_{30}O_5$.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silanised silica gel G.*

Mobile phase. A mixture of 77 volumes of *dichloromethane*, 15 volumes of *ether*, 8 volumes of *methanol* and 1.2 volumes of *water*.

Test solution. Disperse by warming and shaking, a quantity of the ointment containing 2.5 g of Hydrocortisone in 10 ml of *ethanol (95 per cent)*, cool, and allow to stand at 0° for 30 minutes, filter and use the filtrate.

Reference solution (a). A 0.25 per cent w/v solution of *hydrocortisone RS* in *ethanol (95 per cent).*

Reference solution (b). Dissolve 12.5 mg of *hydrocortisone RS* in 5 ml of test solution.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and spray with *alkaline tetrazolium blue solution.* The principal spot in the chromatogram obtained with test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

B. In the Assay, the principal peak in the chromatogram due to hydrocortisone obtained with test solution (b) corresponds to the peak due to hydrocortisone in the chromatogram obtained with reference solution.

C. Fuse a quantity of the ointment containing 0.1 g of Quiniodochlor with *anhydrous sodium carbonate*, dissolve the fused mass in *water* and acidify with *2 M nitric acid.* Add *silver nitrate solution*; a pale yellow precipitate is produced which is insoluble in *5 M ammonia.* Add *5 M ammonia* until the solution becomes alkaline, boil gently, filter and acidify the filtrate with *2 M nitric acid*; a white precipitate is produced which darkens on exposure to light.

Tests

Other tests. Complies with the tests stated under Ointments.

Assay. *For hydrocortisone* — Determine by liquid chromatography (2.4.14).

Test solution (a). Add 30 ml of *2,2,4-trimethylpentane* to a quantity of the ointment containing 10 mg of Hydrocortisone and warm on a water-bath until the preparation has melted. Extract the warm mixture with successive quantities of 30, 20 and 20 ml of *methanol (80 per cent)*, combine the aqueous methanolic layers, cool to about 20° and dilute to 100 ml with the same solvent.

Test solution (b). Prepare at the same manner as test solution (a) but adding 10 ml of a 4 per cent v/v solution of *bromobenzene* in *methanol* to the cooled methanolic extract and dilute to 100.0 ml with *methanol (80 per cent).*

Reference solution. Dissolve 5 mg of *hydrocortisone RS* in 5 ml of a 4 per cent v/v solution of *bromobenzene* (internal standard) in *methanol* and dilute to 50 ml with *methanol (80 per cent).*

Chromatographic system
- a stainless steel column 25 cm x 5 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Spherisorb ODS 1),
- mobile phase: *methanol (65 per cent)*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 242 nm,
- injection volume. 10 µl.

Calculate the content of $C_{21}H_{30}O_5$ in the ointment.

For Quiniodochlor— Weigh accurately a quantity of the ointment containing 25 mg of Clioquinol, add 80 ml of a hot mixture of 24 volumes of *2-methoxy-ethanol* and 6 volumes of *water* and heat on a water-bath for 5 minutes. Cool in ice for 10 minutes, allow to warm to room temperature, dilute to 100 ml with a mixture of 24 volumes of *2-methoxy-ethanol* and 6 volumes of *water*, mix and filter. To 10 ml of the filtrate, add 10

ml of *2-methoxyethanol* and 2 ml of a solution prepared by dissolving 0.5 g of *iron(III) chloride hexahydrate* in 80 ml of *2-methoxyethanol* and adding 0.1 ml of *hydrochloric acid* and sufficient *2-methoxyethanol* to produce 100 ml. Dilute the solution to 25 ml with *2-methoxyethanol* and measure the absorbance of the resulting solution at the maximum at 650 nm (2.4.7), using in the reference cell a solution prepared by treating 10 ml of a mixture of 24 volumes of *2-methoxy-ethanol* and 6 volumes of *water* in the same manner beginning at the words "add 10 ml of *2-methoxyethanol.....*".

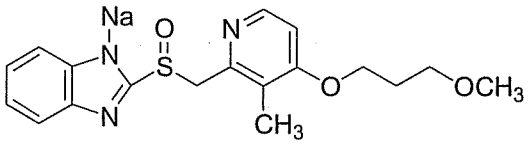
Repeat the operation beginning at the words 'add 10 ml of *2-methoxyethanol* using 10 ml of a solution prepared in the following manner. Dissolve 0.125 g of *clioquinol RS* in sufficient *2-methoxyethanol* to produce 50 ml, warming to effect solution; add 1 ml of *water* to 5 ml of the solution and add sufficient of a mixture of 6 volumes of *water* and 24 volumes of *2-methoxyethanol* to produce 50 ml.

Calculate the content of C_9H_5ClINO in the ointment.

Storage. Store protected from light.

R

Rabeprazole Sodium



$C_{18}H_{20}N_3O_3S,Na$ Mol. Wt. 381.4

Rabeprazole sodium is 2-({[4-(3-methoxypropoxy)-3-methyl-2-pyridinyl]methyl}sulphinyl)-1*H*-benzimidazole sodium.

Rabeprazole sodium contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{18}H_{20}N_3O_3S,Na$, calculated on the anhydrous basis.

Category. Antiulcer.

Description. A white to light yellow, crystalline powder, hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *rabeprazole sodium RS.*

B. A 10 per cent w/v solution in *carbon dioxide-free water* gives reaction of sodium (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of *methanol*, 20 volumes of *water* and 0.1 volume of *diethylamine.*

Test solution. Dissolve 50 mg of the substance under examination in 100 ml with the solvent mixture.

Reference solution (a). A 0.05 per cent w/v solution of *rabeprazole sodium RS* in the solvent mixture.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with solvent mixture.

Chromatographic system as described under Assay.

Inject reference solution (b). The test is not valid unless the tailing factor is not more than 2.0 and the column efficiency in not less than 2000 theoretical plates.

Inject the test solution and reference solution (b). Run the chromatogram three times of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than 1.5 times the area of the peak in the chromatogram obtained with the reference solution (b) (1.5 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Water (2.3.43). Not more than 7.0 per cent, determined on 0.3 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of *methanol*, 20 volumes of *water* and 0.1 volume of *diethylamine.*

Test solution. Dissolve 0.1 g of the substance under examination in 100.0 ml of solvent mixture. Dilute 5.0 ml of the solution to 100.0 ml with the same solvent.

Reference solution. A 0.005 per cent w/v solution of *rabeprazole sodium RS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octylsilane bonded to porous silica (5 µm) (Such as Hypersil keystone betabasic C_8),
- column temperature 40°,
- mobile phase: a mixture of 72 volumes of *0.1 M phosphate buffer pH 7.0* and 28 volumes of *acetonitrile,*
- flow rate. 1.4 ml per minute,
- spectrophotometer set at 282 nm,
- injection volume. 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the percentage content of $C_{18}H_{20}N_3O_3S,Na$.

Storage. Store protected from light and moisture.

Rabeprazole Tablets

Rabeprazole Sodium Tablets

Rabeprazole Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of rabeprazole sodium, $C_{18}H_{20}N_3O_3SNa$. The tablets are enteric coated.

Usual strength. 20 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1,

Medium. 900 ml of *0.1 M hydrochloric acid,*

Speed and time. 50 rpm and 120 minutes.

Replace the *0.1 M hydrochloric acid* with *phosphate buffer pH 7.4.* Run the apparatus at 75 rpm for 45 minutes. Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution immediately, suitably diluted with the dissolution medium, if necessary, at the maximum at about 291 nm (2.4.7). Calculate the content of $C_{18}H_{20}N_3O_3SNa$ in the medium from the absorbance obtained from a solution of known concentration of *rabeprazole sodium RS,* prepared by dissolving in minimum quantity of a mixture of 75 volumes of *acetonitrile* and 25 volumes of *methanol* and suitably diluted with the dissolution medium.

D. Not less than 70 per cent of the stated amount of $C_{18}H_{20}N_3O_3SNa$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of *methanol*, 20 volumes of *water* and 0.1 volume of *diethylamine.*

Test solution. Weigh accurately a quantity of the powdered tablet containing 50 mg of Rabeprazole Sodium, disperse in 100 ml of solvent mixture and filter.

Reference solution (a). A 0.05 per cent w/v solution of *rabeprazole sodium RS* in the solvent mixture.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with solvent mixture.

Chromatographic system as described under Assay.

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 2.0 and the column efficiency in not less than 2000 theoretical plates.

Inject the test solution and reference solution (b). Run the chromatogram three times of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than twice the area of the peak in the chromatogram obtained with reference solution (b) (2.0 per cent) and the sum of areas of all the secondary peaks is not more than 6 times the area of the peak in the chromatogram obtained with the reference solution (b) (6.0 per cent).

Uniformity of content *(For tablets containing 10 mg or less).* Comply with the tests stated under Tablets.

Disperse 1 tablet in sufficient *0.1 M sodium hydroxide* to produce 0.0015 per cent w/v solution. Measure the absorbance of the resulting solution at the maximum at about 292 nm (2.4.7). Calculate the content of $C_{18}H_{20}N_3O_3SNa$ from the absorbance obtained from same concentration of *rabeprazole sodium RS* in the same medium.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of *methanol*, 20 volumes of *water* and 0.1 volume of *diethylamine.*

Test solution. Weigh and powder 20 tablets. Weigh accurately a quantity of the powdered tablet containing 50 mg of Rabeprazole Sodium, disperse in 20 ml of *0.1 M sodium hydroxide* and dilute to 100.0 ml with solvent mixture, filter.

Reference solution. Weigh accurately about 25 mg of *rabeprazole sodium RS*, dissolve in 10 ml of *0.1 M sodium hydroxide* and dilute to 50.0 ml with solvent mixture.

Chromatographic system

- a stainless steel column 25 cm ´ 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of 0.15 per cent w/v solution of *potassium dihydrogen phosphate* previously adjusted pH to 6.0 with *orthophosphoric acid* or *sodium hydroxide solution* and 35 volumes of *acetonitrile*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume. 10 µl.

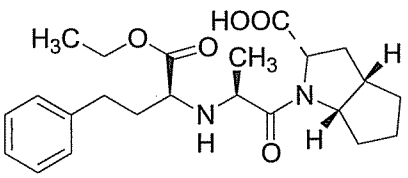
Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{18}H_{20}N_3O_3SNa$.

Storage. Store protected from light and moisture.

Ramipril



$C_{23}H_{32}N_2O_5$ Mol. Wt. 416.5

Ramipril is (2*S*,3a*S*,6a*S*)-1-[(*S*)-2-[[(*S*)-1-(ethoxycarbonyl)-3-phenylpropyl]amino]propanoyl] octahydrocyclopenta[*b*]pyrrole-2-carboxylic acid.

Ramipril contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{23}H_{32}N_2O_5$, calculated on the dried basis.

Category. Antihypertensive.

Description. A white or almost white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ramipril RS.*

Tests

Appearance of solution. A 1.0 per cent w/v solution in *methanol* is clear (2.4.1) and colourless (2.4.1).

Specific optical rotation (2.4.22). +32.0° to +38.0°, determined in 1.0 per cent w/v solution in *0.1 M methanolic hydrochloric acid.*

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 25 ml of mobile phase B.

Reference solution (a). A 0.1 per cent w/v solution of *ramipril RS* in the mobile phase B.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with mobile phase B.

Chromatographic system

- a stainless steel column 25 cm × 4.0 mm packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature. 65°,
- mobile phase: A. dissolve 2.0 g of *sodium perchlorate* in a mixture of 0.5 ml of *triethylamine* and 800 ml of *water;* adjust pH to 3.6 with *orthophosphoric acid* and add 200 ml of *acetonitrile,*
  B. dissolve 2.0 g of *sodium perchlorate* in a mixture of 0.5 ml of *triethylamine* and 300 ml of *water;* adjust pH to 2.6 with *orthophosphoric acid* and add 700 ml of *acetonitrile,*
- a linear gradient programme using the conditions given below,
- flow rate. 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume. 10 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	90	10
6	90	10
7	75	25
20	65	35
30	25	75
40	25	75
45	90	10
55	90	10

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 2.0 and the column efficiency in not less than 2000 theoretical plates.

Inject the test solution and reference solution (b). In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than the area of the peak in the chromatogram obtained with the reference solution (b) (1.0 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.2 per cent, determined on 1.0 g by drying in an oven at 60°, under vacuum, for 4 hours.

Assay. Weigh accurately about 0.3 gm, dissolve in 25 ml of *methanol* and add 25 ml of *water.* Titrate with *0.1 M sodium hydroxide.* Determine the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.04165 gm of $C_{23}H_{32}N_2O_5$.

Storage. Store protected from light.

Ramipril Capsules

Ramipril Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ramipril, $C_{23}H_{32}N_2O_5$.

Usual strengths. 1.25 mg; 2.5 mg; 5 mg; 10 mg.

Identification

Shake a quantity of the content of the capsules containing 25 mg of Ramipril with 50 ml of *acetone,* centrifuge for 10 minutes, filter. Evaporate the filtrate to dryness at 60° for 3 hours. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ramipril RS.*

Tests

Dissolution (2.5.2).

Apparatus No. 1,

Medium. 500 ml of *0.1 M hydrochloric acid,*

Speed and time. 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Dilute the filtrate to get 0.00025 per cent w/v solution of Ramipril with *0.1 M hydrochloric acid.*

Reference solution. A 0.00025 per cent w/v solution of *ramipril RS* in *0.1 M hydrochloric acid.*

Chromatographic system as described under Assay.

Inject the test solution and the reference solution.

Calculate the content of $C_{23}H_{32}N_2O_5$.

D. Not less than 70 per cent of the stated amount of $C_{23}H_{32}N_2O_5$.

Uniformity of content *(For capsules containing 10 mg or less)*. Comply with the test stated under Capsules.

Determine by liquid chromatography (2.4.14).

Test solution. Disperse one capsule in 100 ml of *0.1 M hydrochloric acid*, sonicate for 15 minutes. Dilute if necessary, to produce 0.00025 per cent w/v solution of Ramipril in *0.1 M hydrochloric acid.*

Reference solution. A 0.00025 per cent w/v solution of *ramipril RS* in *0.1 M hydrochloric acid.*

Chromatographic system as described under Assay.

Inject the test solution and the reference solution.

Calculate the content of $C_{23}H_{32}N_2O_5$.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh a quantity of the content of capsules containing 25 mg of Ramipril, disperse in 100.0 ml of *0.1 M hydrochloric acid,* mix and centrifuge. Dilute 1.0 ml of the resulting solution to 100.0 ml with *0.1 M hydrochloric acid.*

Reference solution. A 0.00025 per cent w/v solution of *ramipril RS* in *0.1 M hydrochloric acid.*

Chromatographic system

- a stainless steel column 12.5 cm × 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 42 volumes of *acetonitrile* and 58 volumes of a solution containing 1.4 per cent w/v solution of *sodium perchlorate* and 0.58 per cent w/v solution of *orthophosphoric acid* adjusted to pH 2.5 with *triethylamine*, adjust the pH of the mixture to 2.1 with *orthophosphoric acid*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume. 50 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{23}H_{32}N_2O_5$.

Ramipril Tablets

Ramipril Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ramipril, $C_{23}H_{32}N_2O_5$.

Usual strengths. 1.25 mg; 2.5 mg; 5 mg; 10 mg.

Identification

Shake a quantity of the powdered tablets containing 25 mg of Ramipril with 50 ml of *acetone,* centrifuge for 10 minutes, filter. Evaporate the filtrate to dryness at 60° for 3 hours. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ramipril RS.*

Tests

Dissolution (2.5.2).

Apparatus No. 1,
Medium. 500 ml of *0.1 M hydrochloric acid,*
Speed and time. 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Dilute the filtrate to get 0.00025 per cent w/v solution of Ramipril with *0.1 M hydrochloric acid.*

Reference solution. A 0.00025 per cent w/v solution of *ramipril RS* in *0.1 M hydrochloric acid.*

Chromatographic system as described under Assay.

Inject the test solution and the reference solution.

Calculate the content of $C_{23}H_{32}N_2O_5$.

D. Not less than 70 per cent of the stated amount of $C_{23}H_{32}N_2O_5$.

Uniformity of content *(For tablets containing 10 mg or less).* Comply with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay.

Test solution. Take one tablet, add 5 ml of *0.1 M hydrochloric acid*, sonicate for 10 minutes, dilute, if necessary, with sufficient *0.1 M hydrochloric acid* to produce a solution containing 0.00025 per cent w/v of Ramipril, centrifuge and use the supernatant liquid.

Calculate the content of $C_{23}H_{32}N_2O_5$.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh a quantity of powdered tablets containing 25 mg of Ramipril, disperse in 100.0 ml of *0.1 M hydrochloric acid* and centrifuge. Dilute 1.0 ml of the resulting solution to 100.0 ml with *0.1 M hydrochloric acid.*

Reference solution. A 0.00025 per cent w/v solution of *ramipril RS* in *0.1 M hydrochloric acid.*

Chromatographic system

- a stainless steel column 12.5 cm × 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 42 volumes of *acetonitrile* and 58 volumes of a solution containing 1.4 per cent w/v solution of *sodium perchlorate* and 0.58 per cent w/v solution of *orthophosphoric acid* adjusted to pH 2.5 with *triethylamine*, adjust the pH of the mixture to

2.1 with *orthophosphoric acid*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume. 50 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{23}H_{32}N_2O_5$.

Storage. Store protected from moisture.

Ramipril and Hydrochlorothiazide Tablets

Ramipril and Hydrochlorothiazide Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of ramipril, $C_{23}H_{32}N_2O_5$ and hydrochlorothiazide, $C_7H_8ClN_3O_4S_2$.

Usual strength. Ramipril 2.5 mg and Hydrochlorothiazide 12.5 mg.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution corresponds to the principal peaks in the chromatogram obtained with reference solution (b).

Tests

Dissolution (2.5.2).

Apparatus No. 1,

Medium.750 ml of *0.1 M hydrochloric acid,*

Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Dilute the filtrate, if necessary, with the dissolution medium.

Reference solution (a). Dissolve a quantity of *ramipril RS* in the mobile phase and dilute with dissolution medium to obtain a solution having a known concentration similar to the test solution.

Reference solution (b). Dissolve a quantity of *hydrochlorothiazide RS* in mobile phase and dilute with dissolution medium to obtain a solution having a known concentration similar to the test solution.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Thermo quest Hypersil),
- mobile phase: a mixture of 55 volumes of *water*, 45 volumes of *acetonitrile*, and 0.1 volume of *triethylamine*, adjusted to pH 3.0 with *orthophoshoric acid,*
- flow rate. 0.7 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume. 20 µl.

Inject reference solution (a) and (b). The relative standard deviation for replicate injections for each peak is not more than 2.0 per cent.

Inject the test solution, reference solution (a) and (b).

Calculate the content of $C_{23}H_{32}N_2O_5$ and $C_7H_8ClN_3O_4S_2$.

D. Not less than 75 per cent of the stated amount of $C_{23}H_{32}N_2O_5$ and $C_7H_8ClN_3O_4S_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of powdered tablets containing about 10 mg of Ramipril in mobile phase A, sonicate for 15 minutes and dilute to 10.0 ml with the same solvent.

Reference solution (a). A solution containing 0.2 per cent w/v of *ramipril RS* and 1.0 per cent w/v of *hydrochlorothiazide RS* in mobile phase A.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 50.0 ml with mobile phase A. Dilute 5.0 ml of this solution to 100.0 ml with the same solvent.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature. 35°,
- mobile phase: A. a mixture of 60 volumes of buffer solution prepared by dissolving 4 g of *sodium perchlorate* in 600 ml of *water*, add 1.0 ml of *triethylamine*, adjusted to pH 2.6 with *orthophosphoric acid* and 40 volumes of *acetonitrile*,
  B. a mixture of 85 volumes of buffer solution and 15 volumes of *acetonitrile*,
- a linear gradient programme using the conditions given below,
- flow rate. 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume. 20 µl.

Time (in min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0 - 13	0	100
13 – 17	0 →50	100 →50
17 – 20	50 →100	50 →0
20 – 80	100	0
80 – 82	100 →0	0 →100
82 – 87	0	100

Inject reference solution (b). The test is not valid unless the relative standard deviation for replicate injections for each peak is not more than 5.0 per cent. The relative retention time with reference to ramipril for ramipril impurity A is about 0.9, for ramipril impurity B is about 1.2, for ramipril impurity C is about 1.5 and for ramipril impurity D is about 1.7.

Inject the test solution and reference solution (b). The retention time of ramipril is about 30 minutes and of hydrochlorothiazide is about 10 minutes. In the chromatogram obtained with the test solution the area of each peak due to ramipril impurity A, B and C is not be more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent); the area of peak due to ramipril impurity D is not more than 7 times the area of the principal peak in the chromatogram obtained with reference solution (b) (7.0 per cent); the area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent).

Uniformity of content. Comply with the test stated under Tablets.

For ramipril— Determine by liquid chromatography (2.4.14).

Test solution. Disperse 1 intact tablet in *water* and dilute to 50 ml with the mobile phase.

Reference solution. Dissolve a quantity of *ramipril RS* in the mobile phase and dilute with the mobile phase to obtain a solution having a known concentration similar to the test solution.

Use chromatographic system as described under Assay.

Inject the test solution and the reference solution.

Calculate the content of $C_{23}H_{32}N_2O_5$ in the tablet.

For hydrochlorothiazide—Determine by liquid chromatography (2.4.14).

Test solution. Disperse 1 tablet with sufficient amount of the mobile phase, sonicate for 15 minutes and dilute to 100 ml with the mobile phase.

Reference solution. Dissolve a quantity of *hydrochlorothiazide RS* in the mobile phase and dilute with the mobile phase to obtain a solution having a known concentration similar to the test solution.

Use chromatographic system as described under Assay.

Inject the test solution and the reference solution.

Calculate the content of $C_7H_8ClN_3O_4S_2$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. *For ramipril*—Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh accurately a quantity of powder containing about 25 mg of Ramipril, disperse in *water* and dilute to 250 ml with the mobile phase, filter.

Reference solution. A 0.01 per cent w/v solution of *ramipril RS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm), (Such as Thermo quest Hypersil),
- mobile phase: a mixture of 55 volumes of *water*, 45 volumes of *acetonitrile* and 0.1 volume of *triethylamine,*
- flow rate. 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume.10 µl.

Inject the reference solution. The test is not valid unless the theoretical plates of the principal peak is not less than 2000 theoretical plates and the tailing factor is not more than 2.0. The relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{23}H_{32}N_2O_5$ in the tablet.

For hydrochlorothiazide—

Test solution. Disperse a quantity of the powdered tablets containing about 125 mg of Hydrochlorothiazide with 50 ml of *acetonitrile*, sonicate for 15 minutes and dilute to 250 ml with the mobile phase. Dilute 5.0 ml of this solution to 20 ml with the mobile phase.

Reference solution. Dissolve 12.5 mg of *hydrochlorothiazide RS* with 10 ml of *acetonitrile*, sonicate and dilute to 100 ml with the mobile phase.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 9 volumes of *0.1 M sodium dihydrogen orthophosphate* and 1 volume of *acetonitrile*, adjusted to pH 3.0 with *orthophosphoric acid*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 10 µl.

Inject the reference solution. The test is not valid unless the theoretical plates of hydrochlorothiazide peak is not less than 2000 and the tailing factor is not more than 2.0. The relative standard deviation for replicate injections is not more than 2.0 per cent.

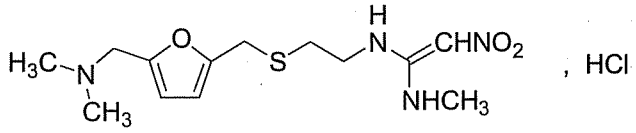
Inject the test solution and the reference solution.

Calculate the content of $C_7H_8ClN_3O_4S_2$ in the tablet.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Labelling. The label states the strength in terms of the equivalent amount of ramipril and hydrochlorothiazide.

Ranitidine Hydrochloride



$C_{13}H_{22}N_4O_3S,HCl$ Mol. Wt. 350.9

Ranitidine Hydrochloride is *N*-[2-[[[5-[(dimethylamino) methyl]furan-2-yl]methyl]thio]ethyl]-*N*-methyl-2-nitroethene-1,1-diamine hydrochloride.

Ranitidine Hydrochloride contains not less than 97.5 per cent and not more than 102.0 per cent of $C_{13}H_{22}N_4O_3S$, HCl, calculated on the dried basis.

Category. Antiulcer (Histamine H_2-receptor antagonist).

Dose. Orally, the equivalent of 300 to 600 mg of ranitidine daily, in divided doses; by intramuscular or slow intravenous injection, the equivalent of 50 mg of ranitidine every 6 to 8 hours. (1.12 g of ranitidine hydrochloride is approximately equivalent to 1 g of ranitidine).

Description. A white to pale yellow, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ranitidine hydrochloride RS* or with the reference spectrum of ranitidine hydrochloride.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

C. A 5 per cent w/v solution gives the reactions of chlorides (2.3.1).

Tests

Appearance of solution. A 1.0 per cent w/v solution is clear (2.4.1), and not more intensely coloured than reference solution BYS5 (2.4.1).

pH (2.4.24). 4.5 to 6.0, determined in a 1.0 per cent w/v solution in *carbon dioxide-free water.*

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 25 volumes of *ethyl acetate,* 15 volumes of *2-propanol,* 4 volumes of *strong ammonia solution* and 2 volumes of *water.*

Test solution (a). Dissolve 0.22 g of the substance under examination in 10 ml of *methanol.*

Test solution (b). Dilute 1 ml of test solution (a) to 100 ml with *methanol.*

Reference solution (a). Weigh accurately a quantity of *ranitidine hydrochloride RS* in *methanol,* and dilute with *methanol* to obtain a solution containing a known concentration of about 0.022 per cent w/v.

Reference solution (b). Dilute 10.0 ml of reference solution (a) to 20 ml with *methanol.*

Reference solution (c). Dilute 30.0 ml of reference solution (a) to 100 ml with *methanol.*

Reference solution (d). Dilute 5.0 ml of reference solution (a) to 100 ml with *methanol.*

Reference solution (e). Weigh accurately a quantity of *(N,N'-bis[2-[[[5-(dimethylamino) methyl]furan-2-yl]methyl] sulphanyl]ethyl]-2-nitroethene-1,1-diamine RS (ranitidine impurity A RS)* in *methanol,* and dilute with *methanol* to obtain a solution containing a known concentration of about 0.127 per cent w/v.

Reference solution (f). Weigh accurately a quantity of *2-[[[5-[(dimethylamino)methyl]furan-2-yl]methyl] sulphanyl]ethanamine RS (ranitidine impurity B RS)* in *methanol,* and dilute with *methanol* to obtain a solution containing a known concentration of about 0.1 per cent w/v.

Apply to the plate 10 µl of each solution except reference solution (e). Apply separately an additional 10 µl of the test solution and on top of this application, apply 10 µl of reference solution (e). After development, dry the plate in air and expose it to iodine vapours in a closed chamber until the spots are revealed. Any spot in the chromatogram obtained with the test solution (a) corresponding to the principal spot in the chromatogram obtained with reference solution (f) is not more intense than that of the principal spot in the chromatogram obtained with reference solution (b) (0.5 per cent) and no other spot in the chromatogram obtained with the test solution is more intense than the principal spot in the chromatogram obtained with reference solution (c) (0.3 per cent). The sum of the intensities of all the secondary spots in the chromatogram obtained with the test solution does not exceed 1.0 per cent.

The test is not valid unless the chromatogram obtained with the combined test solution and reference solution (e) shows two clearly separated principal spots and the chromatogram obtained with reference solution (d) shows a clearly visible spot.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.75 per cent, determined on 1.0 g by drying in an oven at 60° at a pressure not exceeding 2.75 kPa for 3 hours.

Assay. Determine by liquid chromatography (2.4.14)

Test solution. A 0.0112 per cent w/v of the substance under examination in the mobile phase.

Reference solution. 0.0112 per cent w/v of *ranitidine hydrochloride RS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 85 volumes of *methanol* and 15 volumes of *0.1 M ammonium acetate,*
- flow rate. 2 ml per minute,
- spectrophotometer set at 322 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{13}H_{22}N_4O_3S$, HCl.

Storage. Store protected from light and moisture.

Ranitidine Injection

Ranitidine Hydrochloride Injection

Ranitidine Injection is a sterile solution of Ranitidine Hydrochloride in Water for Injections and may be suitably buffered.

Ranitidine Hydrochloride Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ranitidine, $C_{13}H_{22}N_4O_3S$.

Usual strength. The equivalent of 50 mg of ranitidine in 2 ml (1.12 g of ranitidine hydrochloride is approximately equivalent to 1 g of ranitidine).

Identification

A. To a volume of the injection containing 25 mg of ranitidine add 20 ml of *methanol*, mix and evaporate to dryness. Add 1 ml of *light petroleum (60° to 80°)* to the resulting residue, scratch the side of the vessel with a glass rod to induce crystallisation, evaporate to dryness and dry the residue at 60° for 10 minutes.The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ranitidine hydrochloride RS* or with the reference spectrum of ranitidine hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 6.7 to 7.3, if the preparation is buffered; 4.5 to 7.0, if the preparation is unbuffered.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 25 volumes of *ethyl acetate,* 15 volumes of *2-propanol,* 4 volumes of *strong ammonia solution* and 2 volumes of *water.*

Test solution. Dilute suitably a volume of the injection with *water* to produce a solution containing the equivalent of 2.5 per cent w/v of ranitidine in *water.*

Reference solution (a). Weigh accurately a quantity of *ranitidine hydrochloride RS* in *water,* and dilute with *water* to obtain a solution containing a known concentration of about 0.056 per cent w/v.

Reference solution (b). Dilute 10.0 ml of reference solution (a) to 20 ml with *water.*

Reference solution (c). Dilute 5.0 ml of reference solution (a) to 20 ml with *water.*

Reference solution (d). Dilute 6.0 ml of reference solution (c) to 10 ml with *water.*

Reference solution (e). Dilute 5.0 ml of reference solution (b) to 50 ml with *water.*

Reference solution (f). Dilute 5.0 ml of reference solution (e) to 10 ml with *water.*

Reference solution (g). A 0.127 per cent w/v of solution of *(N,N'-bis[2-[[[5-[(dimethylamino)methyl]furan-2-yl]methyl]sulphanyl] ethyl]-2-nitroethene-1,1-diamine RS (ranitidine impurity A RS)* in *methanol.*

Apply to the plate 10 µl of each solution. Apply separately an additional 10 µl of the test solution and on top of this application, apply 10 µl of reference solution (g). After development, dry the plate in air and expose it to iodine vapours in a closed chamber until the spots are revealed. The major secondary spot in the chromatogram obtained with the test solution is not more intense than that of the principal spot in the chromatogram obtained with reference solution (a) (2.0 per cent) and no other secondary spot in the chromatogram obtained with the test solution is more intense than the principal spot in the chromatogram obtained with reference solution (b) (1.0 per cent). The sum of the intensities of all the secondary spots in the chromatogram obtained with the test solution does not exceed 5.0 per cent.

The test is not valid unless the chromatogram obtained with the combined test solution and reference solution (g) shows two clearly separated principal spots and the chromatogram obtained with reference solution (f) shows a clearly visible spot.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. Determine by liquid chromatography (2.4.14)

Test solution. Dilute a volume of the injection containing 10.0 mg of ranitidine to 100.0 ml with the mobile phase.

Reference solution. A 0.0112 per cent w/v solution of *ranitidine hydrochloride RS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 85 volumes of *methanol* and 15 volumes of *0.1 M ammonium acetate,*
- flow rate. 2 ml per minute,
- spectrophotometer set at 322 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{13}H_{22}N_4O_3S$ in the injection.

Storage. Store protected from light.

Labelling. The label states (1) the strength in terms of the equivalent amount of ranitidine; (2) where appropriate, that the injection is buffered.

Ranitidine Tablets

Ranitidine Hydrochloride Tablets

Ranitidine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of the ranitidine, $C_{13}H_{22}N_4O_3S$. The tablets are coated.

Usual strengths. The equivalent of 150 mg, 300 mg of ranitidine (1.12 g of ranitidine hydrochloride is approximately equivalent to 1 g of ranitidine).

Identification

A. Shake a quantity of the powdered tablets containing 25 mg of ranitidine with 5 ml of *methanol* for 5 minutes, filter and evaporate the filtrate to dryness. Add 1 ml of *light petroleum (60° to 80°)* to the resulting residue, scratch the side of the vessel with a glass rod to induce crystallisation, evaporate to dryness and dry the residue at 60° for 10 minutes. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ranitidine hydrochloride RS* or with the reference spectrum of ranitidine hydrochloride.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 25 volumes of *ethyl acetate,* 15 volumes of *2-propanol,* 4 volumes of *strong ammonia solution* and 2 volumes of *water.*

Test solution. Shake a quantity of the powdered tablets containing 0.45 g of ranitidine with 20 ml of *methanol* and filter.

Reference solution (a). Weigh accurately a quantity of *ranitidine hydrochloride RS* in *methanol,* and dilute with *methanol* to obtain a solution containing a known concentration of about 0.022 per cent w/v.

Reference solution (b). Dilute 10 ml of reference solution (a) to 20 ml with *methanol.*

Reference solution (c). Dilute 30 ml of reference solution (a) to 100 ml with *methanol.*

Reference solution (d). Dilute 5 ml of reference solution (a) to 50 ml with *methanol.*

Reference solution (e). Dilute 5 ml of reference solution (a) to 100 ml with *methanol.*

Reference solution (f). Weigh accurately a quantity of *(N,N'-bis[2-[[[5-[(dimethylamino)methyl]furan-2-yl]methyl] sulphanyl]ethyl]-2-nitroethene-1,1-diamine RS (ranitidine impurity A RS)* in *methanol,* and dilute with *methanol* to obtain a solution containing a known concentration of about 0.127 per cent w/v.

Apply to the plate 10 µl of each solution. Apply separately an additional 10 µl of the test solution and on top of this application, apply 10 µl of reference solution (f). After development, dry the plate in air and expose it to iodine vapours in a closed chamber until the spots are revealed. Any spot in the chromatogram obtained with the test solution corresponding to the principal spot in the chromatogram obtained with reference solution (f) is not more intense than that of the principal spot in the chromatogram obtained with reference solution (b) (0.5 per cent) and no other spot in the chromatogram obtained with the test solution is more intense

than the principal spot in the chromatogram obtained with reference solution (c) (0.3 per cent). The sum of the intensities of all the secondary spots in the chromatogram obtained with the test solution does not exceed 2.0 per cent.

The test is not valid unless the chromatogram obtained with the combined test solution and reference solution (f) shows two clearly separated principal spots and the chromatogram obtained with reference solution (e) shows a clearly visible spot.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14)

Test solution. Weigh and powder 20 tablets. Shake 1.5 g of the powder with 400 ml of the mobile phase, dilute to 500.0 ml with the mobile phase, filter and dilute the filtrate with the mobile phase to obtain a solution containing the equivalent of 0.01 per cent w/v of ranitidine.

Reference solution. A 0.0112 per cent w/v solution of *ranitidine hydrochloride RS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm × 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 85 volumes of *methanol* and 15 volumes of *0.1 M ammonium acetate,*
- flow rate. 2 ml per minute,
- spectrophotometer set at 322 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject alternately the test solution and the reference solution.

Calculate the content of $C_{13}H_{22}N_4O_3S$ in the tablets.

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of the equivalent amount of ranitidine.

Purified Rayon

Viscose Fibre; absorbent viscose

Category. Regenerated cellulose used in surgical dressings.

Description. White or very slightly yellow, purified rayon is a fibrous form of bleached regenerated cellulose, which can be produced with a lustrous or matt appearance, and is soft to the touch. The fibres can be produced with average staple length between 32 mm to 80 mm, and are practically odourless.

Identification

A. When examined under a microscope in the dry state, or when mounted in *ethanol (95 per cent)* and *water*, the following characteristics are observed. They are usually of more or less uniform width. Many longitudinal parallel lines are distributed unequally over the width in the case of standard viscose fibres, but such lines are absent or very few in fibres produced through the zinc-free process. The ends are cut more or less straight. Matt fibres contain numerous granular particles of approximately 1µ average diameter.

B. Treat with *iodinated zinc chloride solution*; the fibres become violet.

C. To 0.1 g add 10 ml of *zinc chloride-formic acid solution,* heat to 40° and allow to stand for 2 hours 30 minutes, shaking occasionally. The fibres dissolve completely except for the matt variety where titanium dioxide particles remain.

D. Dissolve the residue obtained in the test for Sulphated ash in 5 ml of *sulphuric acid* with slight warming, allow to cool, and carefully add 0.2 ml of *hydrogen peroxide solution (10 volumes)*. The solution does not undergo colour change in case of lustrous variety of fibre, but for matt variety an orange-yellow colour is obtained, the intensity of which depends on the quantity of titanium dioxide present.

Tests

Colour of extract. Take 15 g of material under examination in a suitable vessel, add 150 ml of *water*, close the vessel and allow to macerate for 2 hours. Decant the solution, squeeze the residual liquid carefully from the sample with a glass rod, mix and filter. The filtered extract is colourless. Compare the colour of the extract with water using identical tubes of colourless, transparent, neutral glass 12 mm in diameter measuring 2 ml. Compare the colours in diffused daylight, viewing horizontally against a white background.

Acidity or alkalinity. To 25 ml of filtered extract obtained, add 0.1 ml of *dilute phenolphthalein solution*; to another 25 ml add 0.05 ml of *methyl orange solution*. Neither solution shows a pink colour.

Foreign fibres. When examined under a microscope, it is seen to consist exclusively of viscose fibres, except that occasionally a few isolated foreign fibres may be present.

Fluorescence. Examine a layer about 5 mm in thickness under ultraviolet light at 365 nm. It displays only a slight, brownish-violet fluorescence and a few yellow particles. Not more than a few isolated fibres show an intense blue fluorescence.

Absorbancy

A. Sinking time. Not more than 10 seconds, determined by the following method.

Apparatus

A dry, cylindrical copper wire basket, 80 mm high and 50 mm in diameter, fabricated from wire of diameter 0.4 mm and having a mesh aperture of 15 to 20 mm; the basket weighs 2.4 to 3.0 g.

Method

Weigh the basket to the nearest 10 mg. Take five samples, each of approximately 1 g, from different places in the material under examination, place loosely in the basket and weigh the packed basket to the nearest 10 mg. Hold the basket with its long axis in the horizontal position and drop it from a height of about 10 mm into *water* at 25° contained in a beaker at least 12 cm in diameter and filled to a depth of 10 cm. Measure with a stopwatch the time taken by the basket to sink below the surface of the water. Repeat the procedure on two further samples and calculate the average value.

B. Water-holding capacity. Not less than 18.0 g per g, determined by the following method.

After the sinking time has been recorded in test A, remove the basket from the *water,* allow it to drain for 30 seconds with its long axis in the horizontal position over the beaker, transfer it to a tared beaker and weigh to the nearest 10 mg. Calculate the weight of *water* retained by the sample. Repeat the procedure on two further samples and calculate the average value.

Colouring matter. Slowly extract 10 g in a narrow percolator with *ethanol (95 per cent)* until 50 ml of extract is obtained. The extract is not more intensely coloured than reference solution YS5 *or* GYS6, (2.4.1) or a solution prepared in the following manner. To 3.0 ml of CSS add 7.0 ml of a solution of *hydrochloric acid* containing 1 per cent w/v of *hydrochloric acid* and dilute 0.5 ml of the resulting solution to 10 ml with the same solution of *hydrochloric acid.*

Ether-soluble substances. Not more than 0.5 per cent, determined by the following method. Extract 5 g with *ether* in a continuous extraction apparatus such as a Soxhlet apparatus, for 4 hours in such a way that the rate is at least four extractions per hour. Evaporate the *ether* and dry the residue to constant weight at 105°.

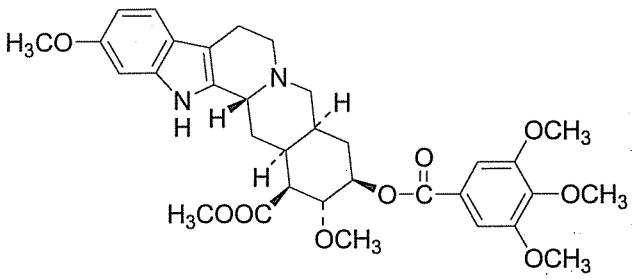
Water-soluble substances. Not more than 0.7 per cent, determined by the following method. Boil 5 g with 500 ml of *water* for 30 minutes, stirring frequently and replacing the *water* lost by evaporation. Decant the liquid into a beaker, squeeze the residual liquid from the material carefully with a glass rod, mix the liquids and filter the extract whilst hot. Evaporate 400 ml of the filtrate and dry the residue to constant weight at 105°.

Hydrogen sulphide. To 10 ml of the filtered extract obtained in the Colour of extract, add 1.9 ml of *water*, 0.15 ml of *dilute acetic acid* and 1 ml of *lead acetate solution.* After 2 minutes, the solution is not more intensely coloured than a reference solution prepared at the same time using 0.15 ml of *dilute acetic acid*, 1.2 ml of *thioacetamide reagent*, 1.7 ml of *lead standard solution (10 ppm Pb)* and 10 ml of filtered extract.

Sulphated ash (2.3.18). Not more than 1.5 per cent.

Loss on drying (2.4.19). Not more than 13.0 per cent, determined on 5 g by drying in an oven at 105°.

Reserpine



$C_{33}H_{40}N_2O_9$ Mol. Wt. 608.7

Reserpine is methyl 11,17α-dimethoxy-18β-[(3,4,5-trimethoxybenzoyl)oxy]-3β,20α-yohimbane-16β-carboxylate.

Reserpine contains not less than 99.0 per cent and not more than 101.0 per cent of total alkaloids and not less than 98.0 per cent and not more than 102.0 per cent of reserpine, $C_{33}H_{40}N_2O_9$, both calculated on the dried basis.

Category. Antihypertensive.

Dose. 500 μg daily.

Description. White to slightly yellow small crystals or a crystalline powder which darkens slowly on exposure to light.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B, C, D and E may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *reserpine RS* or with the reference spectrum of reserpine.

B. Dilute 1 ml of a 0.2 per cent w/v solution in *chloroform* to 100.0 ml with *ethanol (95 per cent)*. When examined immediately after preparation, in the range 230 nm to 360 nm (2.4.7), the resulting solution shows an absorption maximum at about 268 nm; absorbance at about 268 nm, about 0.55. Over the range 288 nm to 295 nm, the spectrum exhibits a slight minimum and then a shoulder or a slight maximum; absorbance over this range, about 0.34.

C. To about 1 mg add 0.1 ml of a 0.1 per cent w/v solution of *sodium molybdate* in *sulphuric acid*; a yellow colour is produced which changes to blue within 2 minutes.

D. To 1 mg add 0.2 ml of a freshly prepared 1 per cent w/v solution of *vanillin* in *hydrochloric acid*; a pink colour develops within 2 minutes.

E. Mix about 0.5 mg with 5 mg of *4-dimethylaminobenzaldehyde* and 0.2 ml of *glacial acetic acid* and add 0.2 ml of *sulphuric acid*; a green colour is produced. Add 1 ml of *glacial acetic acid*; the colour changes to red.

Tests

Specific optical rotation (2.4.22). –116° to –128°, determined in a solution prepared immediately before use by dissolving 0.25 g in sufficient *chloroform* to produce 25 ml.

Oxidation products. Absorbance of a 0.02 per cent w/v solution in *glacial acetic acid* at about 388 nm, measured immediately after preparation, not more than 0.10 (2.4.7).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 0.5 g by drying in an oven over *phosphorus pentoxide* at 60° at a pressure not exceeding 0.7 kPa for 3 hours.

Assay. *For total alkaloids* — Weigh accurately about 0.5 g and dissolve in a mixture of 40 ml of *anhydrous glacial acetic acid* and 6 ml of *acetic anhydride*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.06087 g of total alkaloids.

For reserpine, $C_{33}H_{40}N_2O_9$ — Carry out the following procedure protected from light. Weigh accurately about 25.0 mg, moisten with 2 ml of *ethanol (95 per cent)*, add 2 ml of *0.25 M sulphuric acid* and 10 ml of *ethanol (95 per cent)* and warm gently to dissolve. Cool, dilute to 100.0 ml with *ethanol (95 per cent)* and dilute 5.0 ml to 50.0 ml with the same solvent (solution A). Transfer 10.0 ml to a boiling tube, add 2 ml of *0.25 M sulphuric acid* and 2 ml of a freshly prepared 0.3 per cent w/v solution of *sodium nitrite*, mix and heat in a water-bath at 55° for 35 minutes. Cool, add 1 ml of a freshly prepared 5 per cent w/v solution of *sulphamic acid* and dilute to 25.0 ml with *ethanol (95 per cent)*. Measure the absorbance of the resulting solution at the maximum at about 388 nm (2.4.7), using as the blank a solution prepared by treating a further 10.0 ml of solution A in the same manner and at the same time but omitting the sodium nitrite solution.

Calculate the content of $C_{33}H_{40}N_2O_9$ from the absorbance obtained by repeating the operation using *reserpine RS* in place of the substance under examination.

Storage. Store protected from light.

Reserpine Injection

Reserpine Injection is a sterile solution of Reserpine in Water for Injections prepared with the aid of a suitable acid. It may contain suitable antioxidants.

Reserpine Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of reserpine, $C_{33}H_{40}N_2O_9$.

Usual strengths. 1 mg per ml; 2.5 mg per ml.

Identification

Extract a suitable volume of the injection containing 10 mg of Reserpine with 10 ml of *chloroform* and evaporate the chloroform layer to dryness. The residue complies with the following tests.

Test A may be omitted if tests B, C, D and E are carried out. Tests B, C, D and E may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *reserpine RS* or with the reference spectrum of reserpine.

B. Dilute 1 ml of a 0.2 per cent w/v solution in *chloroform* to 100 ml with *ethanol (95 per cent)*. When examined immediately after preparation, in the range 230 nm to 360 nm (2.4.7), the resulting solution shows an absorption maximum at about 268 nm; absorbance at about 268 nm, about 0.55. Over the range 288 nm to 295 nm, the spectrum exhibits a slight minimum and then a shoulder or a slight maximum; absorbance over this range, about 0.34.

C. To about 1 mg add 0.1 ml of a 0.1 per cent w/v solution of *sodium molybdate* in *sulphuric acid*; a yellow colour is produced which changes to blue within 2 minutes.

D. To 1 mg add 0.2 ml of a freshly prepared 1 per cent w/v solution of *vanillin* in *hydrochloric acid*; a pink colour develops within 2 minutes.

E. Mix about 0.5 mg with 5 mg of *4-dimethylaminobenzaldehyde* and 0.2 ml of *glacial acetic acid* and add 0.2 ml of *sulphuric acid*; a green colour is produced. Add 1 ml of *glacial acetic acid*; the colour changes to red.

Tests

pH (2.4.24). 3.0 to 4.0.

Other tests. Comply with the tests stated under Parenteral Preparations (Injections).

Assay. *Protect the solutions from light throughout the assay.*

Measure accurately a volume of the injection containing about 10 mg of Reserpine and dilute with a 2 per cent w/v solution of *citric acid* to 100.0 ml. Extract 10.0 ml of this solution for

2 minutes with three quantities, each of 15 ml, of *chloroform*. Wash the combined extracts with 10 ml of a 1 per cent w/v solution of *sodium bicarbonate*, add sufficient *chloroform* to produce 50.0 ml, mix and evaporate 10.0 ml to dryness on a water-bath. Dissolve the residue in 10 ml of *ethanol (95 per cent)*, add 2 ml of *0.25 M sulphuric acid* and 10 ml of *ethanol (95 per cent)* and warm gently to dissolve. Cool, dilute to 100.0 ml with *ethanol (95 per cent)* and dilute 5.0 ml to 50.0 ml with the same solvent (solution A). Transfer 10.0 ml to a boiling tube, add 2 ml of *0.25 M sulphuric acid* and 2 ml of a freshly prepared 0.3 per cent w/v solution of *sodium nitrite*, mix and heat in a water-bath at 55° for 35 minutes. Cool, add 1 ml of a freshly prepared 5 per cent w/v solution of *sulphamic acid* and dilute to 25.0 ml with *ethanol (95 per cent)*. Measure the absorbance of the resulting solution at the maximum at about 388 nm (2.4.7), using as the blank a solution prepared by treating a further 10.0 ml of solution A in the same manner and at the same time but omitting the sodium nitrite solution.

Calculate the content of $C_{33}H_{40}N_2O_9$ from the absorbance obtained by repeating the operation using *reserpine RS* in place of the substance under examination.

Storage. Store protected from light in single dose (or if stabilising agents are present, in multiple dose) containers.

Reserpine Tablets

Reserpine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of reserpine, $C_{33}H_{40}N_2O_9$.

Usual strengths. 100 µg; 250 µg; 500 µg; 1 mg.

Identification

A. Powder a few tablets and extract with *chloroform*. Evaporate the extract to dryness, add 0.1 ml of a 0.1 per cent w/v solution of *sodium molybdate* in *sulphuric acid*; a yellow colour is produced which changes to blue within 2 minutes.

B. Powder a few tablets and extract with *chloroform*. Evaporate the extract to dryness, add 0.2 ml of a freshly prepared 1 per cent w/v solution of vanillin in *hydrochloric acid*; a pink colour develops within 2 minutes.

Tests

Uniformity of content. *Protect the solutions from light throughout the test.*

Comply with the test stated under Tablets.

Powder one tablet, disperse in 10 ml of a 2 per cent w/v solution of *citric acid* and extract for 2 minutes with three quantities, each of 5 ml, of *chloroform*, filter the extracts through a plug of cotton moistened with *chloroform*. Wash the chloroform extracts with 10 ml of a 1 per cent w/v solution of *sodium bicarbonate* and evaporate the chloroform extracts to dryness on a water-bath. For tablets containing upto 250 µg of Reserpine per tablet, dissolve the residue in 10.0 ml of *ethanol (95 per cent)*. For tablets containing more than 250 µg of Reserpine per tablet, dissolve the residue in a suitable volume of *ethanol (95 per cent)* to give a concentration of 250 µg of Reserpine per 10.0 ml; add 2 ml of *0.25 M sulphuric acid* and 2 ml of a freshly prepared 0.3 per cent w/v solution of *sodium nitrite*, mix and heat in a water-bath at 55° for 35 minutes. Cool, add 1 ml of a freshly prepared 5 per cent w/v solution of *sulphamic acid* and dilute to 25.0 ml with *ethanol (95 per cent)*. Measure the absorbance of the resulting solution at the maximum at about 388 nm (2.4.7), using as the blank a solution prepared by treating a further 10.0 ml of solution A in the same manner and at the same time but omitting the sodium nitrite solution.

Calculate the content of $C_{33}H_{40}N_2O_9$ in the tablet from the absorbance obtained by repeating the operation using *reserpine RS* in place of the substance under examination.

Other tests. Comply with the tests stated under Tablets.

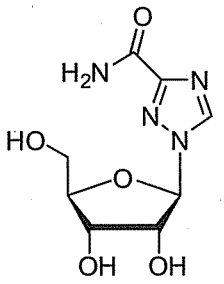
Assay. *Protect the solutions from light throughout the assay.*

Weigh accurately a quantity of the powdered tablets containing about 1 mg of Reserpine, add 10 ml of a 2 per cent w/v solution of *citric acid* and extract for 2 minutes with three quantities, each of 15 ml, of *chloroform*. Wash the combined extracts with 10 ml of a 1 per cent w/v solution of *sodium bicarbonate*, add sufficient *chloroform* to produce 50.0 ml and evaporate 10.0 ml to dryness on a water-bath. Dissolve the residue in 10 ml of *ethanol (95 per cent)* and add 2 ml of *0.25 M sulphuric acid* and 10 ml of *ethanol (95 per cent)* and warm gently to dissolve. Cool, dilute to 100.0 ml with *ethanol (95 per cent)* and dilute 5.0 ml to 50.0 ml with the same solvent (solution A). Transfer 10.0 ml to a boiling tube, add 2 ml of *0.25 M sulphuric acid* and 2 ml of a freshly prepared 0.3 per cent w/v solution of *sodium nitrite*, mix and heat in a water-bath at 55° for 35 minutes. Cool, add 1 ml of a freshly prepared 5 per cent w/v solution of *sulphamic acid* and dilute to 25.0 ml with *ethanol (95 per cent)*. Measure the absorbance of the resulting solution at the maximum at about 388 nm (2.4.7), using as the blank a solution prepared by treating a further 10.0 ml of solution A in the same manner and at the same time but omitting the sodium nitrite solution.

Calculate the content of $C_{33}H_{40}N_2O_9$ from the absorbance obtained by repeating the operation using *reserpine RS* in place of the substance under examination.

Storage. Store protected from light.

Ribavirin



$C_8H_{12}N_4O_5$ Mol.Wt. 244.2

Ribavirin is 1-β-D-ribofuranosyl-1*H*-1,2,4-triazole-3-carboxamide.

Ribavirin contains not less than 98.0 per cent and not more than 102.0 per cent of $C_8H_{12}N_4O_5$, calculated on the dried basis.

Category. Antiviral.

Description. A white or almost white crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ribavirin RS* or with the reference spectrum of ribavirin.

Tests

pH (2.4.24). 4.0 to 6.5, determined in a 2.0 per cent w/v solution in *carbon dioxide-free water.*

Specific optical rotation (2.4.22). - 33° to - 37°, determined in a 1.0 per cent w/v solution, use freshly prepared solution.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution (a). Dissolve 50 mg of the substance under examination in 100 ml of the mobile phase.

Test solution (b). Dissolve 25 mg of the substance under examination in100 ml of the mobile phase. Dilute 10 ml of the solution to 100 ml with the mobile phase.

Reference solution (a). Dilute 1 ml of test solution (a) to 100 ml with the mobile phase. Dilute 1 ml of this solution to 10 ml with the mobile phase.

Reference solution (b). Dissolve the contents of a vial of *ribavirin for system suitability RS* in 2 ml of the mobile phase.

Reference solution (c). Dissolve 25 mg of *ribavirin RS* in 100 ml of the mobile phase. Dilute 10 ml of the solution to 100 ml with the mobile phase.

Chromatographic system
- a stainless steel column 10 cm x 7.8 mm, packed with strong cation-exchange resin (9 µm),
- column temperature. 40°,
- mobile phase. *water*, adjusted to pH 2.5 with *sulphuric acid,*
- flow rate. 1ml per minute,
- spectrophotometer set at 207 nm,
- injection volume. 10 µl.

Inject reference solution (b). The test is not valid unless the peak-to-valley ratio is not less than 1.2, where H_p is the height above the baseline of the peak due to ribavirin impurity F and H_v is the height above the baseline of the lowest point of the curve separating this peak from the peak due to ribavirin.

Inject test solution (a), reference solution (a) and (b). Record the chromatogram eleven times the retention time of the principal peak. The relative retention time with reference to ribavirin for 1-(5-*O*-acetyl-β-D-ribofuranosyl) -1*H*-1,2,4-triazole-3-carboxamide (5'-*O*-acetylribavirin) (ribavirin impurity F) is about 1.2. The peak area corresponding to ribavirin impurity F is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). The area of each secondary peak corresponding to 1-β-D-ribofuranosyl-1*H*-1,2,4-triazole-3-carboxylic acid (ribavirin impurity A), 1-α-D-ribofuranosyl-1*H*-1,2,4-triazole-3-carboxamide (ribavirin impurity B), 1*H*-1,2,4-triazole-3-carboxylic acid (ribavirin impurity C), *H*-1,2,4-triazole-3-carboxamide (ribavirin impurity D), 1-(5-*O*-benzoyl-α -D-ribofuranosyl)-1*H*-1,2,4-triazole-3-carboxamide (5'-O-benzoylribavirin) (ribavirin impurity E), 1- β -D-ribofuranosyl-1*H*-1,2,4-triazole-5-carboxamide (N-isomer) (ribavirin impurity G) is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). The sum of areas of all the secondary peaks is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). Dissolve 4.0 g in 20 ml of *water* with heating if necessary and use 12 ml of the solution. The resulting solution complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 5 hour.

Assay. Determine by liquid chromatography (2.4.14) same as described under Related substances with the following modification.

Inject test solution (b) and reference solution (c).

Calculate the content of $C_8H_{12}N_4O_5$.

Storage. Store protected from light.

Ribavirin Inhalation Solution

Ribavirin Solution for Inhalation

Catogery. Antiviral.

Ribavirin Inhalation Solution is a sterile solution of Ribavirin in Water for Injections. It is prepared by dissolving Ribavirin for Inhalation in the requisite amount of Water for Injections.

Ribavirin for Inhalation

Ribavirin for Inhalation is a sterile ribavirin consisting of Ribavirin with or without excipients. It is filled in a sealed container.

The inhalation solution is constituted by dissolving the contents of the sealed container in the requisite amount of sterile water for injection, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and particulate matter stated under Inhalation Preparations.

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Ribavirin Inhalation Solution contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of $C_8H_{12}N_4O_5$.

The content of the sealed container complies with the requirements stated under Inhalation Preparations and with the following requirements.

Identification

A. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G.*

Mobile phase. A mixture of 20 volumes of *0.1 M ammonium chloride* and 90 volumes of *acetonitrile.*

Test solution. Dissolve ribavirin inhalation solution containing about 0.1 g of Ribavirin in 10 ml of *water.*

Reference solution. A 1.0 per cent w/v solution of *ribavirin RS* in *water.*

Apply to the plate 10 µl of each solution. After development, dry the plate in air for 15 minutes, and spray the plate with the mixture of 0.5 ml of *anisaldehyde*, 0.5 ml of *sulphuric acid,* 0.1 ml of *glacial acetic acid* and 9 ml of *ethanol (95 per cent)* and heat at 105° for 40 minutes and allow to cool.The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to that in the chromatogram obtained with the reference solution.

B. In the Assay, the retention time of the principal peak in the chromatogram obtained with the test solution corresponds to that of the principal peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. A 0.05 per cent w/v solution of ribavirin in the mobile phase.

Reference solution (a). A 0.000125 per cent w/v solution of ribavirin in the mobile phase.

Reference solution (b). A 0.05 per cent w/v solution of *ribavirin RS* in the mobile phase.

Chromatographic system

- a stainless steel column 10 cm x 7.8 mm, packed with strong cation-exchange resin of sulphonated, cross-linked *styrene-divinylbenzene co-polymer* in the hydrogen form (7 to 11 µm) (Such as Aminex HPAH),
- column temperature. 40°,
- mobile phase: *water*, adjusted to pH 2.5 with *sulphuric acid,*
- flow rate. 1 ml per minute,
- spectrophotometer set at 207 nm,
- injection volume. 10 µl.

Inject reference solution (b). The test is not valid unless the tailing factor for the principal peak is not less than 0.7 and not more than 1.5.

Inject the test solution and reference solution (a). In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of principal peak in the chromatogram obtained with reference solution (a) (0.25 per cent) and the sum of the areas of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent).

Sterility (2.2.11). Complies with the test for sterility.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Reconstitute the contents of one container as instructed on the label using an accurately measured volume of diluent, dilute a suitable volume of the solution to 200 volumes with the mobile phase to produce a solution containing 0.1 per cent w/v of Ribavirin, mix and dilute 5 volumes of the resulting solution to 20 volumes with the mobile phase.

Reference solution. A 0.025 per cent w/v solution of *ribavirin RS* in the mobile phase.

Chromatographic system
- a stainless steel column 10 cm x 7.8 mm, packed with strong cation-exchange resin of sulphonated, cross-linked *styrene-divinylbenzene co-polymer* in the hydrogen form (7 to 11 µm) (Such as Aminex HPAH),
- column temperature. 40°,
- mobile phase: *water*, adjusted to pH 2.5 with *sulphuric acid,*
- flow rate. 1 ml per minute,
- spectrophotometer set at 207 nm,
- injection volume. 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not less than 0.7 and not more than 1.5.

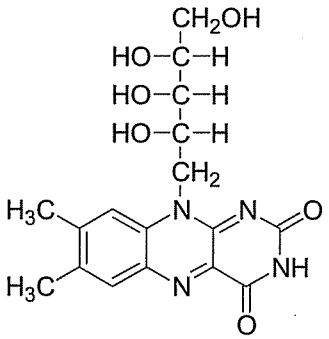
Inject the test solution and the reference solution.

Calculate the content of $C_8H_{12}N_4O_5$ in inhalation solution.

Labelling. The label of the sealed container states (1) the procedure for preparing the solution, (2) the delivery system to be used for the constituted solution (3) the conditions under which the constituted solution should be stored.

Riboflavin

Lactoflavin; Vitamin B_2



$C_{17}H_{20}N_4O_6$ Mol. Wt. 376.4

Riboflavin is 3,10-dihydro-7,8-dimethyl-10-[(2*S*,3*S*,4*R*)-2,3,4,5-tetrahydroxypentyl]benzo[*g*]pteridine-2,4-dione.

Riboflavin contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{17}H_{20}N_4O_6$, calculated on the dried basis.

Category. B-group vitamin.

Dose. Prophylactic, 1 to 4 mg daily; therapeutic, 5 to 10 mg daily.

Description. A yellow to orange-yellow, crystalline powder; odour, slight.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *riboflavine RS* or with the reference spectrum of riboflavine.

B. Dissolve about 1 mg in 100 ml of *water*. The solution has a pale greenish yellow colour by transmitted light and an intense yellowish green fluorescence by reflected light, which disappears on addition of mineral acids or alkalis.

Tests

pH (2.4.24). 5.5 to 7.2, determined in a saturated solution.

Specific optical rotation (2.4.22). –115° to –135°, determined in a 0.5 per cent w/v solution in carbonate-free *0.05 M sodium hydroxide*. Measure the angle of rotation within 30 minutes of preparing the solution.

Light absorption (2.4.7). Dilute a suitable volume of the final solution obtained in the Assay with an equal volume of *water*.

When examined in the range 210 nm to 460 nm, the resulting solution exhibits maxima at about 223 nm, 267 nm, 373 nm and 444 nm; the ratio of the absorbance at the maximum at about 373 nm to that at about 267 nm, 0.31 to 0.33 and the ratio of the absorbance at the maximum at about 444 nm to that at about 267 nm, 0.36 to 0.39.

Lumiflavine. Shake 25 mg with 10 ml of *chloroform* for 5 minutes and filter. The filtrate is not more intensely coloured than reference solution BYS6 (2.4.1).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. *Carry out the procedure in subdued light.*

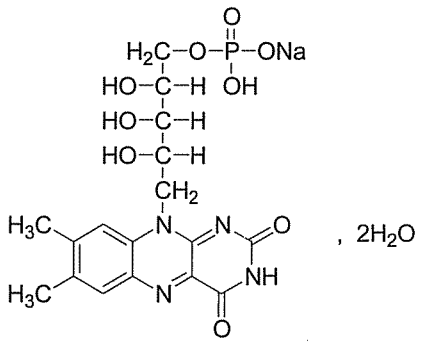
Weigh accurately about 65 mg and transfer to an amber-glass 500-ml volumetric flask, suspend in 5 ml of *water*, ensuring that it is completely wetted. Dissolve in 5 ml of *2 M sodium hydroxide*. As soon as dissolution is complete add 100 ml of *water* and 2.5 ml of *glacial acetic acid* and dilute to 500.0 ml with *water*. To 20.0 ml of this solution add 3.5 ml of a 1.4 per cent w/v solution of *sodium acetate* and dilute to 200.0 ml with *water*. Measure the absorbance of the resulting solution at the maximum at about 444 nm (2.4.7).

Calculate the content of $C_{17}H_{20}N_4O_6$ taking 328 as the specific absorbance at 444 nm.

Storage. Store protected from light.

Riboflavin Sodium Phosphate

Riboflavine-5-phosphate (Sodium Salt); Vitamin B_2 Sodium Phosphate



$C_{17}H_{20}N_4NaO_9P, 2H_2O$ Mol. Wt. 514.4

Riboflavin Sodium Phosphate is monosodium 3,10-dihydro-7,8-dimethyl-10-[(2*S*,3*S*,4*R*)-2,3,4-trihydroxypentyl] benzo[*g*]pteridine-2,4-dione 5-phosphate dihydrate.

Riboflavin Sodium Phosphate contains the equivalent of not less than 73.0 per cent and not more than 79.0 per cent of $C_{17}H_{20}N_4O_6$, calculated on the dried basis.

Category. B-group vitamin.

Dose. Prophylactic, the equivalent of 1 to 4 mg of riboflavine daily; therapeutic, the equivalent of 5 to 10 mg of riboflavine daily. (1.37 g of riboflavine sodium phosphate is approximately equivalent to 1 g of riboflavine).

Description. A yellow to orange-yellow, crystalline powder; hygroscopic.

Identification

A. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *phosphate buffer pH 7.0* shows an absorption maximum at about 267 nm; absorbance at about 267 nm, 0.58 to 0.64.

B. Dissolve about 10 mg in sufficient *2 M sodium hydroxide* to produce 100 ml, expose 1 ml to ultraviolet light at 254 nm for 5 minutes, add sufficient *5 M acetic acid* to make the solution acidic to *litmus paper* and shake the mixture with 2 ml of *dichloromethane*; the lower layer exhibits a yellow fluorescence.

C. To 0.5 g add 10 ml of *nitric acid*, evaporate the mixture to dryness on a water-bath, ignite the residue until the carbon is removed, dissolve the final residue in 5 ml of *water* and filter. The filtrate gives the reactions of sodium salts and reaction B of phosphates (2.4.1).

Tests

pH (2.4.24). 4.0 to 6.3, determined in a 2.0 per cent w/v solution.

Specific optical rotation (2.4.22). +38.0° to +42.0°, determined in a 1.5 per cent w/v solution in *5 M hydrochloric acid.*

Heavy metals (2.3.13). To 2.0 g in a silica crucible add 2 ml of *nitric acid* dropwise followed by 0.25 ml of *sulphuric acid.* Heat cautiously until white fumes are evolved and ignite. Extract the cooled residue with two quantities, each of 2 ml, of *hydrochloric acid* and evaporate the extracts to dryness. Dissolve the residue in 2 ml of *2 M acetic acid* and dilute to 20 ml with *water*. 12 ml of the solution complies with the limit test for heavy metals, Method D (10 ppm). Use 1.0 ml of *lead standard solution (10 ppm Pb)* to prepare the standard.

Lumiflavine. Shake 35 mg with 10 ml of *dichloromethane* for 5 minutes and filter. The filtrate is not more intensely coloured than reference solution BYS6 (2.4.1).

Inorganic phosphate. Not more than 1.5 per cent, determined by the following method. Dissolve 0.1 g in sufficient *water* to produce 100 ml. Dilute 5 ml with 10 ml of *water* and add 5 ml of *buffered cupric sulphate solution pH 4.0*, 2 ml of a 3 per cent w/v solution of *ammonium molybdate*, 1 ml of a freshly prepared solution containing 2 per cent w/v of *4-methyl-aminophenol sulphate* and 5 per cent w/v of *sodium meta-bisulphite* and 1 ml of a 3 per cent v/v solution of *perchloric acid.* Add sufficient *water* to produce 25 ml, mix and measure the absorbance of the resulting solution at the maximum at about 800 nm (2.4.7), within 15 minutes of its preparation, using as the blank a solution prepared in the same manner but omitting the substance under examination. The absorbance is not greater than that produced by repeating the operation using a solution prepared in the same manner using 15 ml of *phosphate standard solution (5 ppm PO_4)* and beginning at the words "add 5 ml of *buffered cupric sulphate solution pH 4.0*,"

Loss on drying (2.4.19). Not more than 8.0 per cent, determined on 0.5 g by drying in an oven at 100° at a pressure not exceeding 0.7 kPa for 5 hours.

Assay. *Carry out the procedure protected from light.*

Weigh accurately about 0.1 g, dissolve in 150 ml of *water*, add 2 ml of *glacial acetic acid* and dilute to 1000.0 ml with *water*. To 10.0 ml add 3.5 ml of a 1.4 per cent w/v solution of *sodium acetate*, dilute to 50.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 444 nm (2.4.7). Calculate the percentage content of $C_{17}H_{20}N_4O_6$ taking 328 as the specific absorbance at 444 nm.

Storage. Store protected from light.

Riboflavin Tablets

Lactoflavin Tablets; Vitamin B_2 Tablets

Riboflavin Tablets contain not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of riboflavine, $C_{17}H_{20}N_4O_6$.

Usual strengths. 2 mg; 5 mg.

Identification

Shake a quantity of the powdered tablets containing 1 mg of Riboflavine with 100 ml of *water* and filter; the filtrate has a pale greenish yellow colour by transmitted light and an intense yellowish green fluorescence by reflected light, which disappears on addition of mineral acids or alkalis.

Tests

Uniformity of content. Comply with the test stated under Tablets.

Powder one tablet, add a mixture of 2.5 ml of *glacial acetic acid* and 50 ml of *water* and heat on a water-bath for 1 hour with occasional stirring. Dilute with 50 ml of *water*, add 15 ml of *1 M sodium hydroxide* with continuous stirring and then sufficient *water* to produce a solution containing 10 µg of Riboflavine per ml. Filter and discard the first few ml of the filtrate. On the clear filtrate carry out the Assay beginning at the words "Measure the absorbance....".

Other tests. Comply with the tests stated under Tablets.

Assay. *Carry out the procedure in subdued light.*

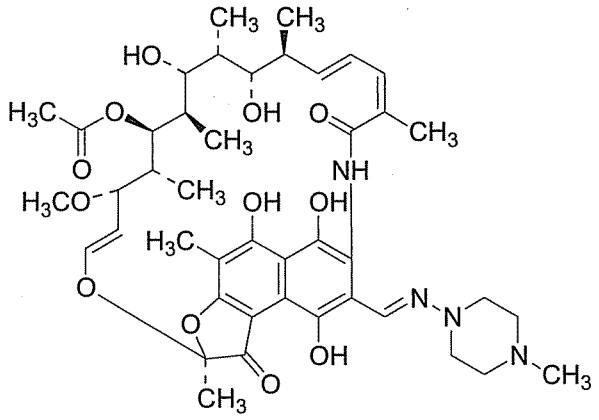
Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 10 mg of Riboflavine, add a mixture of 5 ml of *glacial acetic acid* and 100 ml of *water* and heat on a water-bath for 1 hour with occasional shaking. Dilute with 50 ml of *water*, cool, add 30 ml of *1 M sodium hydroxide* with continuous stirring. Add sufficient *water* to produce 1000.0 ml, mix and filter, discarding the first few ml of the filtrate. Measure the absorbance of the filtrate at the maximum at about 444 nm (2.4.7).

Calculate the content of $C_{17}H_{20}N_4O_6$ taking 328 as the specific absorbance at 444 nm.

Storage. Store protected from light.

Rifampicin

Rifampin



$C_{43}H_{58}N_4O_{12}$ Mol. Wt. 823.0

Rifampicin is (12*Z*,14*E*,24*E*)-(2*S*,16*S*,17*S*,18*R*,19*R*,20*R*,21*S*,22*R*,23*S*)-1,2-dihydro-5,6,9,17,19-pentahydroxy-23-methoxy-2,4,12,16,18,20,22-heptamethyl-8-(4-methyl-piperazin-1-yliminomethyl)-1,11-dioxo-2,7-(epoxypentadeca-1,11,13-trienimino)naphtho[2,1-*b*]furan-21-yl acetate.

Rifampicin contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{43}H_{58}N_4O_{12}$, calculated on the dried basis.

Category. Antitubercular.

Dose. For an adult, 450 to 600 mg (about 10 mg per kg) daily preferably before breakfast. For a child, upto 20 mg per kg daily to a maximum of 600 mg.

Description. A brick-red to reddish brown, crystalline powder; practically odourless.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *rifampicin RS* or with the reference spectrum of rifampicin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 4.5 to 6.5, determined in a 1.0 per cent w/v suspension.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. A mixture of 10 volumes of a 21.01 per cent w/v solution of *citric acid*, 23 volumes of a 13.61 per cent w/v solution of *potassium dihydrogen phosphate*, 77 volumes of a 17.42 per cent w/v solution of *dipotassium hydrogen phosphate*, 640 volumes of *water* and 250 volumes of *acetonitrile*.

Test solution. Weigh accurately a quantity of powder containing 20 mg of Rifampicin, add 10 ml of *acetonitrile*, shake and filter. Dilute 5 ml of the filtrate to 50 ml with the solvent mixture.

Reference solution. A solution containing 0.02 per cent w/v of *rifampicin quinone RS* in *acetonitrile*. To 1 ml of the solution, add 1 ml of the test solution and dilute to 100 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of a solution containing 0.1 per cent v/v of *orthophosphoric acid*, 0.19 per cent w/v of *sodium perchlorate*, 0.59 per cent w/v of *citric acid* and 2.09 per cent w/v of *potassium dihydrogen phosphate* and 35 volumes of *acetonitrile*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the resolution between rifampicin and rifampicin quinone is not less than 4.

In the chromatogram obtained with the test solution the area of any peak due to rifampicin quinone is not more than 1.5 times the area of the peak due to rifampicin quinone in the chromatogram obtained with the reference solution (1.5 per cent); the area of any peak, other than the peak due to rifampicin and rifampicin quinone, is not more than the area of the peak due to rifampicin in the chromatogram obtained with the reference solution (1.0 per cent) and the sum of the areas of any such peaks is not more than 3.5 times the area of the peak due to rifampicin in the chromatogram obtained with the reference solution (3.5 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 80° at a pressure not exceeding 0.7 kPa for 4 hours.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. A mixture of 10 volumes of a 21.01 per cent w/v solution of *citric acid*, 23 volumes of a 13.61 per cent w/v solution of *potassium dihydrogen phosphate*, 77 volumes of a 17.42 per cent w/v solution of *dipotassium hydrogen phosphate*, 640 volumes of *water* and 250 volumes of *acetonitrile*.

Test solution. Dissolve 20.0 mg of the substance under examination in 10.0 ml of *acetonitrile* and filter. Dilute 5.0 ml of the filtrate to 100.0 ml with the solvent mixture.

Reference solution. A solution containing 0.2 per cent w/v of *rifampicin RS* in *acetonitrile*. Dilute 5.0 ml of this solution to 100.0 ml with the solvent mixture.

Use the chromatographic system and the system suitability parameters described under the test for Related substances.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{43}H_{58}N_4O_{12}$.

Storage. Store protected from light, in an atmosphere of nitrogen.

Rifampicin Capsules

Rifampin Capsules

Rifampicin Capsules contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of rifampicin, $C_{43}H_{58}N_4O_{12}$.

Usual strengths. 150 mg; 300 mg; 450 mg; 600 mg.

Identification

A. Shake a quantity of the contents of the capsules containing 0.15 g of Rifampicin with 5 ml of *chloroform*, filter and evaporate the filtrate to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *rifampicin RS* or with the reference spectrum of rifampicin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. A mixture of 10 volumes of a 21.01 per cent w/v solution of *citric acid*, 23 volumes of a 13.61 per cent

w/v solution of *potassium dihydrogen phosphate*, 77 volumes of a 17.42 per cent w/v solution of *dipotassium hydrogen phosphate*, 640 volumes of *water* and 250 volumes of *acetonitrile*.

Test solution. Shake a quantity of the contents of the capsules containing 200 mg of Rifampicin, with 100 ml of *acetonitrile* and filter. Dilute 5 ml of the filtrate to 50 ml with the solvent mixture.

Reference solution (a). A solution containing 0.02 per cent w/v of *rifampicin RS* in *acetonitrile*. Dilute 1 ml of this solution to 100 ml with the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v each of *rifampicin RS* and *rifampicin quinone RS* in *acetonitrile*. Dilute 5 ml of this solution to 50 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 10 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature. 30°,
- mobile phase: a mixture of 65 volumes of a solution containing 0.1 per cent v/v of *orthophosphoric acid*, 0.19 per cent w/v of *sodium perchlorate*, 0.59 per cent w/v of *citric acid* and 2.09 per cent w/v of *potassium dihydrogen phosphate* and 35 volumes of *acetonitrile*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between rifampicin and rifampicin quinone is not less than 4, the tailing factor is not more than 2.0 and the column efficiency is not less than 2000 theoretical plates.

Inject the test solution and reference solution (a). The relative retention times are 1.0, 0.55, 1.25 and 2.61 for rifampicin, rifampicin quinone, rifampicin N-oxide and 3-formylrifamycin SV respectively. The response factors are 1.00, 1.19, 1.03 and 1.25 for rifampicin, rifampicin quinone, rifampicin N-oxide and 3-formylrifamycin SV respectively.

In the chromatogram obtained with the test solution the area of any peak due to rifampicin quinone should not be more than 4 times the area of the principal peak in the chromatogram obtained with the reference solution, the area of any peak due to rifampicin N-oxide should not be more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution and the area of any peak due to 3-formylrifamycin SV should not be more than the area of the principal peak in the chromatogram obtained with the reference solution. In the chromatogram obtained with the test solution the area of any unknown peak should not be more than the area of the principal peak in the chromatogram obtained with the reference solution.

Dissolution (2.5.2).

Apparatus No. 2,
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc having an average pore diameter not greater than 1.0 µm, rejecting the first 1 ml of the filtrate. Dilute the filtrate, if necessary, with the same solvent. Measure the absorbance (2.4.7) of the resulting solution at the maximum at about 475 nm. Calculate the content of $C_{43}H_{58}N_4O_{12}$ in the medium from the absorbance obtained from a solution of known concentration of *rifampicin RS*.

D. Not less than 75 per cent of the stated amount of $C_{43}H_{58}N_4O_{12}$.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the contents of the capsules containing about 300.0 mg of Rifampicin, with 200.0 ml of *acetonitrile*, filter. Dilute 10.0 ml of the filtrate to 50.0 ml with *acetonitrile*. Dilute 5.0 ml of this solution to 50.0 ml with the solvent mixture.

Reference solution (a). A 0.15 per cent w/v solution of *rifampicin RS* in *acetonitrile*. Dilute 10.0 ml of this solution to 50.0 ml with *acetonitrile*. Dilute 5.0 ml of the resulting solution to 50.0 ml with the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v each of *rifampicin RS* and *rifampicin quinone RS* in *acetonitrile*. Dilute 5ml of this solution to 50 ml with the solvent mixture.

Use the chromatographic system and system suitability parameters, as described under the test for Related substances.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and reference solution (a).

Calculate the content of $C_{43}H_{58}N_4O_{12}$ in the capsules.

Storage. Store protected from light and moisture.

Rifampicin Oral Suspension

Rifampicin oral suspension contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of rifampicin, $C_{43}H_{58}N_4O_{12}$.

Usual strengths. 10 mg per ml; 20 mg per ml.

Identification

A. To a quantity containing 0.1 g of Rifampicin add 30 ml of *water* and shake with two quantities, each of 50 ml, of *chloroform*. Dry the combined extracts with *anhydrous sodium sulphate*, filter and evaporate the filtrate to dryness at a temperature not exceeding 70°. Wash the residue with 1 ml of *ether* and dry at 70°. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *rifampicin RS* or with the reference spectrum of rifampicin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 4.2 to 4.8.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. A mixture of 10 volumes of a 21.01 per cent w/v solution of *citric acid*, 23 volumes of a 13.61 per cent w/v solution of *potassium dihydrogen phosphate*, 77 volumes of a 17.42 per cent w/v solution of *dipotassium hydrogen phosphate*, 640 volumes of *water* and 250 volumes of *acetonitrile*.

Test solution. Add 5 ml of *water* to a quantity of the oral suspension containing 20 mg of Rifampicin and extract with four quantities, each of 10 ml, of *dichloromethane*, filter the combined extracts and evaporate to dryness at a temperature not exceeding 40°. Dissolve the residue in 10 ml of *acetonitrile*. Dilute 5 ml of the resulting solution to 50 ml with the solvent mixture.

Reference solution (a). A solution containing 0.02 per cent w/v of *rifampicin RS* in *acetonitrile*. Dilute 1 ml of this solution to a 100 ml with the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v each of *rifampicin RS* and *rifampicin quinone RS* in *acetonitrile*. Dilute 5 ml of this solution to 50 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 10 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature. 30°,
- mobile phase: a mixture of 65 volumes of a solution containing 0.1 per cent v/v of *orthophosphoric acid*, 0.19 per cent w/v of *sodium perchlorate*, 0.59 per cent w/v of *citric acid* and 2.09 per cent w/v of *potassium dihydrogen phosphate* and 35 volumes of *acetonitrile*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between rifampicin and rifampicin quinone is not less than 4; the tailing factor is not more than 2.0 and the column efficiency is not less than 2000 theoretical plates.

Inject the test solution and reference solution (a). The relative retention times are 1.0, 0.55, 1.25 and 2.61 for rifampicin, rifampicin quinone, rifampicin N-oxide and 3-formylrifamycin SV respectively. Multiply the areas of each known impurity by their response factor. The response factors are 1.00, 1.19, 1.03, 1.22 and 1.25 for rifampicin, rifampicin quinone, rifampicin N-oxide, Isonicotinyl hydrazone and 3-formylrifamycin SV respectively.

In the chromatogram obtained with the test solution the area of any peak due to rifampicin quinone should not be more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution, the area of any peak due to rifampicin N-oxide should not be more than the area of the principal peak in the chromatogram obtained with the reference solution and the area of any peak due to 3-formylrifamycin SV should not be more than 5.0 times the area of the principal peak in the chromatogram obtained with the reference solution. In the chromatogram obtained with the test solution the area of any unknown peak should not be more than the area of the principal peak in the chromatogram obtained with the reference solution.

Other tests. Comply with the tests stated under Oral Suspensions.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh accurately a quantity of the oral suspension containing about 150 mg of rifampicin and dilute to 100.0 ml with *acetonitrile*. Dilute 10.0 ml of this solution to 50.0 ml with *acetonitrile*. Dilute 10.0 ml of the resulting solution to 50.0 ml with the solvent mixture.

Reference solution (a). A 0.15 per cent w/v solution of *rifampicin RS* in *acetonitrile*. Dilute 10.0 ml of the solution to 50.0 ml with *acetonitrile*. Dilute 10.0 ml of the resulting solution to 50.0 ml with the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v of each of *rifampicin RS* and *rifampicin quinone RS* in *acetonitrile*. Dilute 5 ml of this solution to 50 ml with the solvent mixture.

Use the chromatographic system and the system suitability parameters as described under the test for Related substances.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and reference solution (a).

Determine the weight per ml of the suspension (2.4.29) and calculate the content of $C_{43}H_{58}N_4O_{12}$ weight in volume.

Storage. Store protected from light and moisture.

Rifampicin Tablets

Rifampin Tablets

Rifampicin Tablets contain not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of rifampicin, $C_{43}H_{58}N_4O_{12}$.

Usual strength. 150 mg.

Identification

A. Shake a quantity of the powdered tablets containing 0.15 g of Rifampicin with 5 ml of *chloroform*, filter and evaporate the filtrate to dryness. The residue complies with the following test.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *rifampicin RS* or with the reference spectrum of rifampicin.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. A mixture of 10 volumes of a 21.01 per cent w/v solution of *citric acid*, 23 volumes of a 13.61 per cent solution w/v of *potassium dihydrogen phosphate*, 77 volumes of a 17.42 per cent w/v solution of *dipotassium hydrogen phosphate*, 640 volumes of *water* and 250 volumes of *acetonitrile*.

Test solution. Weigh accurately a quantity of the powdered tablets containing 200 mg of Rifampicin, dissolve in 100 ml of *acetonitrile*, filter. Dilute 5 ml of the filtrate to 50 ml with the solvent mixture.

Reference solution (a). A solution containing 0.02 per cent w/v of *rifampicin RS* in *acetonitrile*. Dilute 1 ml of this solution to a 100 ml with the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v of each of *rifampicin RS* and *rifampicin quinone RS* in *acetonitrile*. Dilute 5 ml of this solution to 50 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 10 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column. temperature. 30°,
- mobile phase: a mixture of 65 volumes of a solution containing 0.1 per cent v/v of *orthophosphoric acid*, 0.19 per cent w/v of *sodium perchlorate*, 0.59 per cent w/v of *citric acid* and 2.09 per cent w/v of *potassium dihydrogen phosphate* and 35 volumes of *acetonitrile*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between rifampicin and rifampicin quinone is not less than 4, the tailing factor is not more than 2.0 and the column efficiency is not less than 2000 theoretical plates.

Inject the test solution and reference solution (a). The relative retention times are 1.0, 0.55, 1.25 and 2.61 for rifampicin, rifampicin quinone, rifampicin N-oxide, and 3-formylrifamycin SV respectively. The response factors are 1.00, 1.19, 1.03 and 1.25 for rifampicin, rifampicin quinone, rifampicin N-oxide and 3-formylrifamycin SV respectively.

In the chromatogram obtained with the test solution the area of any peak due to rifampicin quinone should not be more than 4 times the area of the principal peak in the chromatogram obtained with the reference solution (4 per cent), the area of any peak due to rifampicin N-oxide should not be more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent) and the area of any peak due to 3-formyl rifamycin SV should not be more than the area of the principal peak in the chromatogram obtained with the reference solution (1 per cent). In the chromatogram obtained with the test solution the area of any unknown peak should not be more than the area of the principal peak in the chromatogram obtained with the reference solution.

Dissolution (2.5.2).

Apparatus No. 2,
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc having an average pore diameter not greater than 1.0 µm, rejecting the first 1 ml of the filtrate. Dilute the filtrate, if necessary, with the same solvent. Measure the absorbance (2.4.7) of the resulting solution at the maximum at about 475 nm. Calculate the content of $C_{43}H_{58}N_4O_{12}$ in the medium from the absorbance obtained from a solution of known concentration of *rifampicin RS*.

D. Not less than 75 per cent of the stated amount of $C_{43}H_{58}N_4O_{12}$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 300.0 mg of Rifampicin, dissolve in 200.0 ml of *acetonitrile*, filter. Dilute 10.0 ml of the filtrate to 50.0 ml with *acetonitrile*. Dilute 5.0 ml of this solution to 50.0 ml with the solvent mixture.

Reference solution (a). A 0.15 per cent w/v solution of *rifampicin RS* in *acetonitrile*. Dilute 10.0 ml of this solution to 50.0 ml with *acetonitrile*. Dilute 5.0 ml of the resulting solution to 50.0 ml with the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v each of *rifampicin RS* and *rifampicin quinone RS* in *acetonitrile*. Dilute 5.0 ml of this solution to 50.0 ml with the solvent mixture.

Use the chromatographic system and system suitability parameters described under the test for Related substances.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and reference solution (a).

Calculate the content of $C_{43}H_{58}N_4O_{12}$ in the tablets.

Storage. Store protected from light and moisture.

Rifampicin and Isoniazid Tablets

Rifampin and Isonicotinylhydrazid Tablets

Rifampicin and Isoniazid Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of rifampicin, $C_{43}H_{58}N_4O_{12}$ and isoniazid, $C_6H_7N_3O$.

Usual strength. Rifampicin 50 mg and Isoniazid 150 mg.

Identification

A. In the Assay, the chromatogram obtained with the test solution shows peaks that correspond to the peaks due to *rifampicin RS* and *isoniazid RS* in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. A mixture of 10 volumes of a 21.01 per cent w/v solution of *citric acid*, 23 volumes of a 13.61 per cent w/v solution of *potassium dihydrogen phosphate*, 77 volumes of a 17.42 per cent w/v solution of *dipotassium hydrogen phosphate*, 640 volumes of *water* and 250 volumes of *acetonitrile*.

Test solution. Weigh accurately a quantity of the powdered tablets containing 200 mg of Rifampicin in 100 ml of *acetonitrile* and filter. Dilute 5 ml of the filtrate to 50 ml with the solvent mixture.

Reference solution (a). Dissolve *rifampicin RS* in *acetonitrile* to obtain a solution containing 0.2 mg per ml. Dilute 1 ml of this solution to 100 ml with the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v each of *rifampicin RS* and *rifampicin quinone RS* in *acetonitrile*. Dilute 5 ml of this solution to 50 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 10 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature 30°,
- mobile phase: a mixture of 65 volumes of a solution containing 0.1 per cent v/v of *orthophosphoric acid*, 0.19 per cent w/v of *sodium perchlorate*, 0.59 per cent w/v of *citric acid* and 2.09 per cent w/v of *potassium dihydrogen phosphate* and 35 volumes of *acetonitrile*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between rifampicin and rifampicin quinone is not less than 4, the tailing factor is not more than 2.0 and the column efficiency is not less than 2000 theoretical plates.

Inject the test solution and reference solution (a). The relative retention times are 1.0, 0.55, 1.25, 1.51 and 2.61 for rifampicin, rifampicin quinone, rifampicin N-oxide, 3-formylrifamycin SV isonicotinyl hydrazone and 3-formylrifamycin SV respectively. Multiply the area of each known impurity by its response factor. The response factors are 1.00, 1.19, 1.03, 1.22 and 1.25 for rifampicin, rifampicin quinone, rifampicin N-oxide, isonicotinyl hydrazone and 3-formylrifamycin SV respectively.

In the chromatogram obtained with the test solution the area of any peak due to rifampicin quinone should not be more than 4 times the area of the principal peak in the chromatogram obtained with the reference solution (4 per cent), the area of any peak due to rifampicin N-oxide should not be more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent), the area of any peaks due to 3-formylrifamycin SV and isonicotinyl hydrazone should not be more than 5 times the area of the principal peak in the chromatogram obtained with the reference solution (5 per cent) and the area of any peak due to 3-formylrifamycin SV should not be more than the area of the

principal peak in the chromatogram obtained with the reference solution (1.0 per cent). In the chromatogram obtained with the test solution the area of any unknown peak should not be more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent).

Dissolution (2.5.2).

Apparatus No. 2,
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc with an average pore diameter not greater than 0.8 µm. Reject the first few ml of the filtrate and dilute a suitable volume of the filtrate with the medium.

Reference stock solution. A solution containing 0.0165 per cent of *rifampicin RS* and 0.00825 per cent of *isoniazid RS* in the dissolution medium.

For rifampicin — Measure the absorbance of the sample solution and the reference stock solution suitably diluted with the dissolution medium at 475 nm (2.4.7). Calculate the content of $C_{43}H_{58}N_4O_{12}$ in the medium from the absorbance obtained from the reference stock solution.

For isoniazid — Determine by liquid chromatography (2.4.14).

Use the reference stock solution and sample solution suitably diluted with a solution of *0.05 M potassium dihydrogen orthophosphate*, adjust the pH to 6.2 with *0.1 M sodium hydroxide* to obtain the reference solution and the test solution, respectively.

Chromatographic system
- a stainless steel column 30 cm × 3.9 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 99 volumes of *0.05 M potassium dihydrogen phosphate* and 1 volume of *acetonitrile* with the pH adjusted to 4.0 ± 0.05 with 2 per cent w/v solution of *phosphoric acid*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency in not less than 1500 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_6H_7N_3O$ in the dissolution medium.

D. Not less than 75 per cent of the stated amounts of $C_{43}H_{58}N_4O_{12}$ and $C_6H_7N_3O$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Dissolve 1.4 g of *disodium hydrogen orthophosphate anhydrous* in 1000 ml of *water* and adjust the pH to 6.8 with *dilute phosphoric acid.*

Test solution. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 40 mg of Isoniazid, dissolve in 100.0 ml of *methanol* and dilute to 500.0 ml with the solvent mixture.

Reference solution. A solution containing 0.08 per cent w/v of *rifampicin RS* and 0.04 per cent w/v of *isoniazid RS* in *methanol.* Dilute 10.0 ml of this solution to 50.0 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column. temperature 30°,
- mobile phase: A. a mixture of 96 volumes of buffer solution pH 6.8 prepared by dissolving 1.4 g of *disodium hydrogen orthophosphate anhydrous* in 1000 ml of *water* and adjusting the pH to 6.8 ± 0.05 with *dilute phosphoric acid*, and 4 volumes of *acetronitrile.*
  B. a mixture of 45 volumes of the buffer solution and 55 volumes of *acetonitrile*,
- flow rate. 1.5 ml per minute,
- a linear gradient programme using the conditions given below,
- spectrophotometer set at 238 nm,
- injection volume. 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
5	100	0
6	0	100
15	0	100
16	100	0
20	100	0

NOTE — Saturate the column with mobile phase B for about 1 hour before injection.

Inject the reference solution. The tailing factor is not more than 2.0 for rifampicin and isoniazid; the column efficiency for the isoniazid peak is not less than 3000 and for rifampicin not less than 25000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject alternately the test solution and the reference solution. The retention times are about 1.0 for rifampicin and about 0.3 for isoniazid.

Calculate the contents of $C_{43}H_{58}N_4O_{12}$ and $C_6H_7N_3O$ in the tablets.

Storage. Store protected from moisture.

Rifampicin, Isoniazid and Ethambutol Tablets

Rifampin, Isonicotinylhydrazid and Ethambutol Hydrochloride Tablets

Rifampicin, Isoniazid and Ethambutol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of rifampicin, $C_{43}H_{58}N_4O_{12}$, isoniazid, $C_6H_7N_3O$ and ethambutol hydrochloride $C_{10}H_{24}N_2O_2.2HCl$.

Usual strength. Rifampicin 300 mg, Isoniazid 200 mg and Ethambutol 200 mg.

Identification

A. In the Assay for rifampicin and isoniazid, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with the reference solution.

B. In the Assay for ethambutol hydrochloride the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. A mixture of 10 volumes of a 21.01 per cent w/v solution of *citric acid*, 23 volumes of a 13.61 per cent w/v solution of *potassium dihydrogen phosphate*, 77 volumes of a 17.42 per cent w/v solution of *dipotassium hydrogen phosphate*, 640 volumes of *water* and 250 volumes of *acetonitrile*.

Test solution. Weigh accurately a quantity of the powdered tablets containing 200 mg of Rifampicin, dissolve in 100 ml of *acetonitrile* and filter. Dilute 5 ml of this solution to 50 ml with the solvent mixture.

Reference solution (a). A solution containing 0.02 per cent w/v of *rifampicin RS* in *acetonitrile*. Dilute 1 ml of this solution to 100 ml with the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v each of *rifampicin RS* and *rifampicin quinone RS* in *acetonitrile*. Dilute 5 ml of this solution to 50 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 10 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature. 30°,
- mobile phase: a mixture of 65 volumes of a solution containing 0.1 per cent v/v of *orthophosphoric acid*, 0.19 per cent w/v of *sodium perchlorate*, 0.59 per cent w/v of *citric acid* and 2.09 per cent w/v of *potassium dihydrogen phosphate* and 35 volumes of *acetonitrile*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between rifampicin and rifampicin quinone is not less than 4, the tailing factor is not more than 2.0 and the column efficiency is not less than 2000 theoretical plates.

Inject the test solution and reference solution (a). The relative retention times are 1.0, 0.55, 1.25, 1.51 and 2.61 for rifampicin, rifampicin quinone, rifampicin N-oxide, 3-formylrifamycin SV Isonicotinyl hydrazone and 3-formylrifamycin SV respectively. Multiply the areas of each known impurity by its response factor. The response factors are 1.00, 1.19, 1.03, 1.22 and 1.25 for rifampicin, rifampicin quinone, rifampicin N-oxide, Isonicotinyl hydrazone and 3-formylrifamycin SV respectively.

In the chromatogram obtained with the test solution the area of any peak due to rifampicin quinone should not be more than 4 times the area of the principal peak in the chromatogram obtained with the reference solution (4 per cent), the area of any peak due to rifampicin N-oxide should not be more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent), the area of any peak due to 3-formylrifamycin SV Isonicotinyl hydrazone should not be more than 5 times the area of the principal peak in the chromatogram obtained with the reference solution (5 per cent) and the area of any peak due to 3-formylrifamycin SV should not be more than the area of the principal peak in the chromatogram obtained with the reference solution (1 per cent). In the chromatogram obtained with the test solution the area of any unknown peak should not be more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent).

Dissolution (2.5.2).

Apparatus No. 2,

Medium. 900 ml of *0.1 M hydrochloric acid,*

Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc with an average pore diameter not greater than 0.8 µm. Reject the first few ml of the filtrate.

Reference stock solution. A solution containing 0.0165 per cent w/v of *rifampicin RS*, 0.00825 per cent w/v of *isoniazid RS* and 0.031 per cent w/v of *ethambutol hydrochloride RS* in the dissolution medium. Keep this reference stock solution in the dissolution bath during the test run.

For rifampicin — Dilute the filtrate, if necessary, with the same solvent. Measure the absorbance (2.4.7) of the resulting solution at the maximum at about 475 nm. Calculate the content

of $C_{43}H_{58}N_4O_{12}$ in the medium from the absorbance obtained from suitably diluted reference stock solution.

For isoniazid — Determine by liquid chromatography (2.4.14).

Test solution. Suitably dilute the filtered medium with *0.05 M potassium dihydrogen orthophosphate* with the pH adjusted to 6.2 with *0.1 M sodium hydroxide.*

Reference solution. Suitably dilute the reference stock solution with *0.05 M potassium dihydrogen orthophosphate* with the pH adjusted to 6.2 with *0.1 M sodium hydroxide.*

Chromatographic system

- a stainless steel column 30 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 99 volumes of *0.05 M potassium dihydrogen phosphate* and 1 volume of *acetonitrile* previously adjusted to pH 4.0 with a 2 per cent w/v solution of *phosphoric acid,*
- flow rate. 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency in not less than 1500 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_6H_7N_3O$ in the dissolution medium.

For ethambutol hydrochloride — Determine by liquid chromatography (2.4.14).

Test solution. Suitably dilute the filtered medium with *0.05 M potassium dihydrogen orthophosphate* adjusted to pH 6.2 with *0.1 M sodium hydroxide.*

Reference solution. Suitably dilute the reference stock solution with *0.05 M potassium dihydrogen orthophosphate* with the pH adjusted to 6.2 with *0.1 M sodium hydroxide.*

Use the chromatographic system described under the Assay of ethambutol hydrochloride.

Calculate the content of $C_{10}H_{24}N_2O_2.2HCl$ in the dissolution medium.

D. Not less than 75 per cent of the stated amounts of $C_{43}H_{58}N_4O_{12}$, $C_6H_7N_3O$ and $C_{10}H_{24}N_2O_2.2HCl$.

Other tests. Comply with the tests stated under Tablets.

Assay. *For rifampicin and isoniazid* — Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh accurately a quantity of the powdered tablets containing about 40 mg of Isoniazid dissolve in 100.0 ml of *methanol*, dilute to 500.0 ml with the diluent and mix.

Reference solution. A solution containing 0.08 per cent w/v of *rifampicin RS* and *0.04* per cent w/v of *isoniazid RS* in *methanol.* Dilute 10.0 ml of this solution to 50.0 ml with the diluent.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature. 30°,
- mobile phase: A. a mixture of 96 volumes of buffer solution pH 6.8 (diluent) prepared by dissolving 1.4 g of *disodium hydrogen orthophosphate anhydrous* in 1000 ml of *water*, and adjusting the pH to 6.8 ± 0.05 with *dilute phosphoroic acid*, and 4 volumes of *acetonitrile*, B: a mixture of 45 volumes of the buffer solution and 55 volumes of *acetonitrile,*
- flow rate. 1.5 ml per minute,
- a linear gradient programme using the conditions given below,
- spectrophotometer set at 238 nm,
- injection volume. 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
5	100	0
6	0	100
15	0	100
16	100	0
22	100	0

NOTE — Saturate the column with mobile phase B for about 1 hour.

Inject the reference solution. The test is not valid unless the tailing factor is not less than 2.0 for rifampicin and isoniazid, the column efficiency determined from isoniazid peak is not less than 3000 and that from rifampicin is not less than 25000 theoretical plates respectively, and the relative standard deviation for replicate injections is not more than 2.0 per cent. The relative retention times are about 1.0 for rifampicin and about 0.3 for isoniazid.

Calculate the contents of $C_{43}H_{58}N_4O_{12}$ and $C_6H_7N_3O$ in the tablets.

For ethambutol hydrochloride — Determine by liquid chromatography (2.4.14).

Test solution. Weigh accurately a quantity of the powdered tablets containing about 60 mg of Ethambutol Hydrochloride and dissolve in 100.0 ml of the diluent.

Reference solution. A 0.06 per cent w/v solution of *ethambutol hydrochloride RS* in the diluent.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with nitrile groups chemically bonded to porous silica particles 5 (µm) (such as Zorbax SB CN),
- mobile phase: a mixture of 50 volumes of *acetonitrile*, and 50 volumes of a buffer solution pH 7.0 prepared by dissolving 1 ml of *triethylamine* in 1000 ml of *water* and adjusting the pH to 7.0 with *dilute phosphoric acid*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 200 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent, the tailing factor is not more than 3.0 and the column efficiency determined from Ethambutol hydrochloride peak is not less than 1500 theoretical plates.

Inject the test solution and the reference solution.

Calculate the content of $C_{10}H_{24}N_2O_2.2HCl$ in the tablets.

Storage. Store protected from moisture.

Rifampicin, Isoniazid and Pyrazinamide Tablets

Rifampin, Isonicotinylhydrazid and Pyrazinamide Tablets

Rifampicin, Isoniazid and Pyrazinamide Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of rifampicin, $C_{43}H_{58}N_4O_{12}$, isoniazid, $C_6H_7N_3O$ and pyrazinamide $C_5H_5N_3O$.

Usual strength. Rifampicin 120 mg, Isoniazid 50 mg and Pyrazinamide 300 mg.

Identification

In the Assay of rifampicin, isoniazid and pyrazinamide, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. A mixture of 10 volumes of a 21.01 per cent w/v solution of *citric acid*, 23 volumes of a 13.61 per cent w/v solution of *potassium dihydrogen phosphate*, 77 volumes of 17.42 per cent w/v solution of *dipotassium hydrogen phosphate*, 640 volumes of *water* and 250 volumes of *acetonitrile*.

Test solution. Weigh accurately a quantity of the powdered tablets containing about 200 mg of Rifampicin, dissolve in 100 ml of *acetonitrile* and filter. Dilute 5 ml of this solution to 50 ml with the solvent mixture.

Reference solution (a). A solution containing 0.02 per cent w/v of *rifampicin RS* in *acetonitrile*. Dilute 1ml of this solution to a 100 ml with the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v each of *rifampicin RS* and *rifampicin quinone RS* in *acetonitrile*. Dilute 5 ml of this solution to 50 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 10 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature. 30°,
- mobile phase: a mixture of 65 volumes of a solution containing 0.1 per cent v/v of *orthophosphoric acid*, 0.19 per cent w/v of *sodium perchlorate*, 0.59 per cent w/v of *citric acid* and 2.09 per cent w/v of *potassium dihydrogen phosphate*, 35 volumes of *acetonitrile*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between rifampicin and rifampicin quinone is not less than 4, the tailing factor is not more than 2.0 and the column efficiency is not less than 2000 theoretical plates.

Inject the test solution and reference solution (a). The relative retention times are 1.0, 0.55, 1.25, 1.51 and 2.61 for rifampicin, rifampicin quinone, rifampicin N-oxide, 3-formylrifamycin SV Isonicotinyl hydrazone and 3-formylrifamycin SV respectively. Multiply the area of each known impurity by its response factor. The response factors are 1.00, 1.19, 1.03, 1.22 and 1.25 for rifampicin, rifampicin quinone, rifampicin N-oxide, Isonicotinyl hydrazone and 3-formylrifamycin SV respectively.

In the chromatogram obtained with the test solution the area of any peak due to rifampicin quinone should not be more than 4 times the area of the principal peak in the chromatogram obtained with the reference solution (4 per cent), the area of any peak due to rifampicin N-oxide should not be more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent), the area of any peak due to 3-formylrifamycin SV Isonicotinyl hydrazone should not be more than 5 times the area of the principal peak in the chromatogram obtained with the reference solution (5 per cent) and the area of any peak due to 3-formylrifamycin SV should not be more than the area of the principal peak in the chromatogram obtained with the reference solution (1 per cent). In the chromatogram obtained with the test solution the area of any unknown peak should not be more than

1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent).

Dissolution (2.5.2).

Apparatus No. 2,
Medium. 900 ml of a solution containing 2 g of *sodium chloride* and 7.0 ml of *hydrochloric acid* in 1000 ml of *water*, with a pH of about 1.2,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter disc with an average pore diameter not greater than 0.8 µm. Reject the first few ml of the filtrate.

Reference stock solution. A solution containing 0.0165 per cent w/v of *rifampicin RS*, 0.00825 per cent w/v of *isoniazid RS* and 0.04375 per cent w/v of *pyrazinamide RS* in the dissolution medium and filtered. Keep this reference stock solution in the dissolution bath during the test run.

For rifampicin — Dilute the filtrate, if necessary, with the same solvent. Measure the absorbance (2.4.7) of the resulting solution at the maximum at about 475 nm. Calculate the content of $C_{43}H_{58}N_4O_{12}$ in the medium from the absorbance obtained from suitably diluted reference stock solution.

For isoniazid and pyrazinamide — Determine by liquid chromatography (2.4.14).

NOTE — Use this solution within one hour from preparation.

Test solution. To 15.0 ml of the filtered medium, add 15 ml of *1 M dibasic potassium phosphate*, dilute to 100.0 ml with the mobile phase and mix.

Reference solution (a). To 15.0 ml of the reference stock solution, add 15 ml of *1 M dibasic potassium phosphate*, dilute to 100.0 ml with the mobile phase and mix.

Reference solution (b). To 10.0 ml of a 0.0125 per cent w/v solution of *isonicotinic acid* in the dissolution medium, add 4.0 ml of the reference stock solution and 15 ml of *1 M dibasic potassium phosphate*, dilute to 100.0 ml with the mobile phase and mix.

Chromatographic system
- a stainless steel column 30 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 860 volumes of *water*, 100 volumes of *1 M monobasic potassium phosphate* and 40 volumes of *acetonitrile*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 50 µl.

Inject the test solution and reference solutions (a) and (b). The relative retention times are about 0.7 for isonicotinic acid, 1.0 for pyrazinamide and 1.8 for isoniazid.

The test is not valid unless in the chromatogram obtained with reference solution (b) the resolution between isonicotinic acid and pyrazinamide is not more than 2.5 and between pyrazinamide and isoniazid is not more than 4.0.

Calculate the contents of $C_6H_7N_3O$ and $C_5H_5N_3O$ in the medium.

D. Not less than 75 per cent of the stated amounts of $C_{43}H_{58}N_4O_{12}$, $C_6H_7N_3O$ and $C_5H_5N_3O$.

Other tests. Comply with the tests stated under Tablets.

Assay. *For rifampicin, isoniazid and pyrazinamide* — Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh accurately a quantity of the powdered tablets containing about 40 mg of Isoniazid, dissolve in 100.0 ml of *methanol*, dilute to 500 ml with the buffer solution pH 6.8 and mix.

Reference solution. A solution containing 0.08 per cent w/v of *rifampicin RS*, 0.04 per cent w/v of *isoniazid RS* and 0.2 per cent w/v of *pyrazinamide RS* in *methanol*. Dilute 10.0 ml of this solution to 50.0 ml with the buffer solution pH 6.8.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column. temperature 30°,
- mobile phase: A. a mixture of 96 volumes of buffer solution pH 6.8 (diluent) prepared by dissolving 1.4 g of *disodium hydrogen orthophosphate anhydrous* in 1000 ml of *water*, adjusted to pH 6.8 ± 0.05 with *dilute phosphoroic acid* and 4 volumes of *acetonitrile*,
  B. a mixture of 45 volumes of the buffer solution and 55 volumes of *acetonitrile*,
- flow rate. 1.5 ml per minute,
- a linear gradient programme using the conditions given below,
- spectrophotometer set at 238 nm,
- injection volume. 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
5	100	0
6	0	100
15	0	100
16	100	0
22	100	0

NOTE — Saturate the column with mobile phase (B) for about 1 hour.

Inject the test solution and the reference solution. The test is not valid unless the tailing factor is not less than 2.0 for rifampicin, isoniazid and pyrazinamide, the column efficiencies determined from Isoniazid, pyrazinamide and that from rifampicin are not less than 3000, 5000 and 25000 theoretical plates respectively, and the relative standard deviation for

replicate injections is not more than 2.0 per cent. The relative retention times are about 1.8 for rifampicin, about 0.7 for isoniazid and about 1.0 for pyrazinamide.

Inject the test solution and the reference solution.

Calculate the contents of $C_{43}H_{58}N_4O_{12}$, $C_6H_7N_3O$ and $C_5H_5N_3O$ in the tablets.

Storage. Store protected from moisture.

Rifampicin, Isoniazid, Pyrazinamide and Ethambutol Tablets

Rifampin, Isonicotinylhydrazid, Pyrazinamide and Ethambutol Hydrochloride Tablets

Rifampicin, Isoniazid, Pyrazinamide and Ethambutol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of rifampicin, $C_{43}H_{58}N_4O_{12}$, isoniazid, $C_6H_7N_3O$, pyrazinamide, $C_5H_5N_3O$ and ethambutol hydrochloride, $C_{10}H_{24}N_2O_2.2HCl$.

Usual strength. Rifampicin 150 mg, Isoniazid 75 mg, Pyrazinamide 400 mg and Ethambutol 275 mg.

Identification

A. In the Assay for rifampicin, isoniazid and pyrazinamide, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with the reference solution.

B. In the Assay for ethambutol hydrochloride, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. A mixture of 10 volumes of a 21.01 per cent w/v solution of *citric acid*, 23 volumes of a 13.61 per cent w/v solution of *potassium dihydrogen phosphate*, 77 volumes of a 17.42 per cent w/v solution of *dipotassium hydrogen phosphate*, 640 volumes of *water* and 250 volumes of *acetonitrile*.

Test solution. Weigh accurately a quantity of powdered tablets containing 200 mg of Rifampicin, dissolve in 100 ml of *acetonitrile* and filter. Dilute 5 ml of this solution to 50 ml with the solvent mixture.

Reference solution (a). Dissolve 20 mg of *rifampicin RS* in 100 ml of *acetonitrile*. Dilute 1 ml of this solution to a 100 ml with the solvent mixture.

Reference solution (b). A solution containing 0.01 per cent w/v each of *rifampicin RS* and *rifampicin quinone RS* in *acetonitrile*. Dilute 5 ml of this solution to 50 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 10 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature. 30°,
- mobile phase: a mixture of 65 volumes of a solution containing 0.1 per cent v/v of *orthophosphoric acid*, 0.19 per cent w/v of *sodium perchlorate*, 0.59 per cent w/v of *citric acid* and 2.09 per cent w/v of *potassium dihydrogen phosphate*, 35 volumes of *acetonitrile*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between rifampicin and rifampicin quinone is not less than 4, the tailing factor is not more than 2.0 and the column efficiency is not less than 2000 theoretical plates.

Inject the test solution and reference solution (a). The relative retention times are 1.0, 0.55, 1.25, 1.51 and 2.61 for rifampicin, rifampicin quinone, rifampicin N-oxide, 3-formylrifamycin SV Isonicotinyl hydrazone and 3-formylrifamycin SV respectively. Multiply the area of each known impurity by its response factor. The response factors are 1.00, 1.19, 1.03, 1.22 and 1.25 for rifampicin, rifampicin quinone, rifampicin N-oxide, Isonicotinyl hydrazone and 3-formylrifamycin SV respectively.

In the chromatogram obtained with the test solution the area of any peak due to rifampicin quinone should not be more than 4 times the area of the principal peak in the chromatogram obtained with the reference solution (4 per cent), the area of any peak due to rifampicin N-oxide should not be more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent), the area of any peak due to 3-formylrifamycin SV Isonicotinyl hydrazone should not be more than 5 times the area of the principal peak in the chromatogram obtained with the reference solution (5 per cent) and the area of any peak due to 3-formylrifamycin SV should not be more than the area of the principal peak in the chromatogram obtained with the reference solution (1 per cent). In the chromatogram obtained with the test solution the area of any unknown peak should not be more than 1.5 times the area of the principal peak in the chromatogram obtained with the reference solution (1.5 per cent).

Dissolution (2.5.2).

Apparatus No. 1,

Medium. 900 ml of *sodium phosphate buffer pH 6.8* prepared by dissolving 7 g of *dibasic sodium phosphate anhydrous* in 5000 ml of *water* and adjusting to pH 6.8 with *phosphoric acid*,

Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter disc with an average pore diameter not greater than 0.8 µm. Reject the first few ml of the filtrate. Determine the amounts of rifampicin, $C_{43}H_{58}N_4O_{12}$, isoniazid, $C_6H_7N_3O$, pyrazinamide, $C_5H_5N_3O$ and ethambutol hydrochloride, $C_{10}H_{24}N_2O_2.2HCl$ by using the methods described in the Assay for rifampicin, isoniazid, pyrazinamide and ethambutol hydrochloride.

D. Not less than 75 per cent of the stated amounts of $C_{43}H_{58}N_4O_{12}$, $C_6H_7N_3O$, $C_5H_5N_3O$ and $C_{10}H_{24}N_2O_2.2HCl$.

Other tests. Comply with the tests stated under Tablets.

Assay. *For rifampicin, isoniazid and pyrazinamide* — Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh accurately a quantity of the powdered tablets containing about 40 mg of Isoniazid, dissolve in 100 ml of *methanol*, dilute to 500 ml with the buffer solution pH 6.8, mix and filter.

Reference solution. A solution containing 0.08 per cent w/v of *rifampicin RS*, 0.04 per cent w/v of *isoniazid RS* and 0.2 per cent w/v of pyrazinamide *RS* in *methanol*. Dilute 10.0 ml of this solution to 50.0 ml with the buffer solution pH 6.8.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column. temperature 30°,
- mobile phase: A. a mixture of 96 volumes of buffer solution pH 6.8 prepared by dissolving 1.4 g of *disodium hydrogen orthophosphate anhydrous* in 1000 ml of *water*, adjusting to pH 6.8 ± 0.05 with *dilute phosphoric acid* and 4 volumes of *acetonitrile*,

  B. a mixture of 45 volumes of the buffer solution and 55 volumes of *acetonitrile*,
- flow rate. 1.5 ml per minute,
- a linear gradient programme using the conditions given below,
- spectrophotometer set at 238 nm,
- injection volume. 20 µl.

Time (in min.)	Solution A (per cent v/v)	Solution B (per cent v/v)
0	100	0
5	100	0
6	0	100
15	0	100
16	100	0
22	100	0

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent, the tailing factor is not more than 2.0 for rifampicin, isoniazid and pyrazinamide and the column efficiencies for isoniazid, pyrazinamide and rifampicin are not less than 3000, 5000 and 25000 theoretical plates respectively.

Inject the test solution and the reference solution. The relative retention time for rifampicin is 1.8, for isoniazid, 0.7 and for pyrazinamide, 1.0.

Calculate the contents of $C_{43}H_{58}N_4O_{12}$, $C_6H_7N_3O$ and $C_5H_5N_3O$ in the tablets.

For ethambutol hydrochloride — Determine by liquid chromatography (2.4.14).

Test solution. Weigh accurately a quantity of the powdered tablets containing about 60 mg of Ethambutol Hydrochloride and dissolve in 100 ml of the solvent mixture.

Reference solution. A 0.06 per cent w/v solution of *ethambutol hydrochloride RS* in the solvent mixture.

Chromatographic system

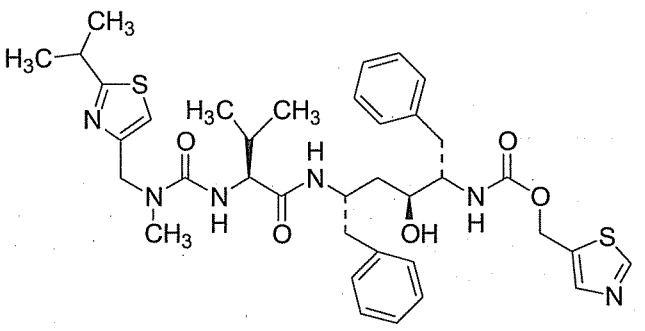
- a stainless steel column 15 cm × 4.6 mm, packed with nitrile groups chemically bonded to porous silica particles (5 µm),
- mobile phase: a mixture of 50 volumes of *acetonitrile*, and 50 volumes of buffer solution pH 7.0 (diluent) prepared by dissolving 1 ml of *triethylamine* in 1000 ml of *water* and adjusting the pH to 7.0 with *dilute phosphoric acid*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 200 nm,
- injection volume. 50 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent, the tailing factor is not more than 3.0 and the column efficiency determined from ethambutol hydrochloride peak is not less than 1500 theoretical plates.

Calculate the content of $C_{10}H_{24}N_2O_2.2HCl$ in the tablets.

Storage. Store protected from moisture.

Ritonavir



$C_{37}H_{48}N_6O_5S_2$ Mol. Wt. 721.0

Ritonavir is (5*S*,8*S*,10*S*,11*S*)-10-hydroxy-2-methyl-5-(1-methylethyl)-1-[2-(1-methylethyl)-4-thiazolyl]-3,6-dioxo-8,11-bis(phenylmethyl)-2,4,7,12-tetraazatridecan-13-oic acid 5-thiazolylmethyl ester.

Ritonavir contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{37}H_{48}N_6O_5S_2$, calculated on the anhydrous basis.

Category. Antiretroviral.

Dose. 100 mg twice daily.

Description. A white to off-white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *ritonavir RS* or with the reference spectrum of ritonavir.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to ritonavir in the chromatogram obtained with the reference solution.

C. Melting point. 119° to 123° (2.4.21).

Tests

Specific optical rotation (2.4.22). +7.0° to +10.5°, determined in a 0.2 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14), as described in the Assay and calculate the percentage of each impurity peak in the chromatogram obtained with the test solution. Not more than 0.5 per cent of any individual impurity and not more than 1.0 per cent of total impurities is found.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent

Water (2.3.43). Not more than 0.5 per cent, determined on 2.0 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25.0 mg of the substance under examination in sufficient of a mixture of 45 volumes of *acetonitrile* and 55 volumes of *water* to produce 100.0 ml.

Reference solution. A 0.025 per cent w/v solution of *ritonavir RS* in a mixture of 45 volumes of *acetonitrile* and 55 volumes of *water*.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 45 volumes of *acetonitrile* and 55 volumes of a buffer solution prepared by dissolving 3.4 g of *sodium acetate* and 0.94 g of *sodium hexanesulphonate* in 1000 ml of *water* and adjusting the pH to 4.0 with *hydrochloric acid*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 239 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency determined from the ritonavir peak is not less than 1000 theoretical plates, the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{37}H_{48}N_6O_5S_2$.

Storage. Store protected from light.

Ritonavir Capsules

Ritonavir Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ritonavir, $C_{37}H_{48}N_6O_5S_2$.

Usual strength. 100 mg.

Identification

A. In the test for Assay, the principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. When examined in the range 200 nm to 350 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* shows absorption maxima at the same wavelengths as the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1,
Medium. 900 ml of *0.1 M hydrochloric acid* with 25 mM polyoxyethylene 10 lauryl ether prepared by dissolving 15.65 g of *polyoxyethylene 10 lauryl ether* in 950 ml of *water*. Add 8.5 ml of *hydrochloric acid* and dilute to 1000 ml with *water*,
Speed and time. 50 rpm and 90 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. Use the filtrate and if necessary, dilute with the dissolution medium.

Reference solution. A 0.1 per cent w/v solution of *ritonavir RS* in *methanol*. Dilute 5 ml of the solution to 50 ml with the dissolution medium.

Use the chromatographic system described under Assay.

Inject the test solution and the reference solution.

D. Not less than 70 per cent of the stated amount of $C_{37}H_{48}N_6O_5S_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 40 volumes of *0.03M monobasic potassium phosphate buffer* and 60 volumes of *acetonitrile*.

Test solution. Weigh accurately a quantity of the mixed contents of 20 capsules containing about 25 mg of Ritonavir, dissolve in 50 ml of the solvent mixture and filter.

Reference solution (a). A 0.05 per cent w/v solution of *ritonavir RS* in the solvent mixture.

Reference solution (b). Dilute 1 ml of the solution to 100 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with butyl silane chemically bonded to porous silica (3 µm) (Such as ACE C4),
- mobile phase: A. a mixture of 69 volumes of *0.03 M monobasic potassium phosphate buffer* prepared by dissolving 4.1 g of *monobasic potassium phosphate* in 1000 ml of *water*, 18 volumes of acetonitrile, 8 volumes of *tetrahydrofuran* and 5 volumes of n-*butanol*,
  B. a mixture of 40 volumes of *0.03 M monobasic potassium phosphate buffer*, 47 volumes of acetonitrile, 8 volumes of *tetrahydrofuran* and 5 volumes of *n-butanol*,
- flow rate. 1 ml per minute,
- a linear gradient programme using the conditions given below,
- spectrophotometer set at 240 nm,
- injection volume. 50 µl.

Time (in min.)	mobile phase A (per cent v/v)	mobile phase B (per cent v/v)
0	100	0
60	100	0
120	0	100
155	100	0

Inject the reference solution (a). The test is not valid unless the tailing factor is not more than 2.0 and the column efficiency in not less than 5000 theoretical plates.

Inject the test solution and reference solution (b). In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 2.5 times the area of the peak in the chromatogram obtained with the reference solution (b) (2.5 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the peak in the chromatogram obtained with the reference solution (b) (5.0 per cent).

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh accurately a quantity of the mixed contents of 20 capsules containing about 25 mg of Ritonavir, disperse in 100.0 ml of *methanol* and filter.

Reference solution. A 0.025 per cent w/v solution of *ritonavir RS* in *methanol*.

Chromatographic system

- a stainless steel column 5 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (3.5 µm),
- column temperature 45°,
- mobile phase: a mixture of 55 volumes of a buffer solution prepared by dissolving 3.4 g of *sodium acetate trihydrate* and 0.94 g of *sodium 1-hexanesulphonate* in 1000 ml of *water* and adjusting the pH to 4.0 with *hydrochloric acid*, and 45 volumes of *acetonitrile*,
- flow rate. 2.5 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume. 10 µl.

Inject the reference solution. Run the chromatogram 1.5 times the retention time (about 3 minutes)of the principal peak The test is not valid unless the tailing factor is not more than 2.0, the column efficiency in not less than 2000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{37}H_{48}N_6O_5S_2$ in the capsules.

Storage. Store protected from light in a refrigerator (2° to 8°).

Ritonavir Tablets

Ritonavir Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of ritonavir, $C_{37}H_{48}N_6O_5S_2$.

Usual strength. 100 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2)

Apparatus No. 1,

Medium. 900 ml of a solution prepared by dissolving 15.7 g of *polyoxyethylene 10-lauryl ether* in 1000 ml of a 0.85 per cent v/v solution of *hydrochloric acid*,
Speed and time. 100 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14)

Test solution. The filtrate obtained as given above. Dilute the filtrate if necessary, with the dissolution medium.

Reference solution. A 0.1 per cent w/v solution of *ritonavir RS* in *methanol*. Dilute 5 ml of the solution to 50 ml with the dissolution medium.

Use the chromatographic system described under Assay.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation of replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{37}H_{48}N_6O_5S_2$.

D. Not less than 75 per cent of the stated amount of $C_{37}H_{48}N_6O_5S_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. A mixture of 40 volumes of *0.03 M monobasic potassium phosphate* and 60 volumes of *acetonitrile*.

Test solution: Shake a quantity of the powdered tablets containing 25 mg of Ritonavir with 50 ml of the solvent mixture.

Reference solution (a). A 0.05 per cent w/v solution of *ritonavir RS* in the solvent mixture.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm × 4.6 mm, packed with silica gel consisting of porous spherical particles with chemically bonded with nitrile group (3µm) (such as YMC C4),
- mobile phase: A. a mixture of 69 volumes of *0.03 M monobasic potassium phosphate solution*, 18 volumes of *acetonitrile*, 8 volumes of *tetrahydrofuran* and 5 volumes of *n- butanol*,
  B. a mixture of 40 volumes of *0.03 M monobasic potassium phosphate solution*, 47 volumes of *acetonitrile*, 8 volumes of *tetrahydrofuran* and 5 volumes of *n-butanol*,
- flow rate. 1 ml per minute,
- a linear gradient programme using the conditions given below,
- spectrophotometer set at 240 nm,
- injection volume. 100 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
60	100	0
120	0	100
121	100	0
155	100	0

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution and reference solution (b). In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 2.5 times the area of the peak in the chromatogram obtained with the reference solution (b) (2.5 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the peak in the chromatogram obtained with the reference solution (b) (5.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14)

Test solution. Weigh accurately a quantity of the powdered tablets containing 25 mg of Ritonavir and disperse in 100.0 ml of *methanol*.

Reference solution. A 0.025 per cent w/v solution of *ritonavir RS* in *methanol*.

Chromatographic system
- a stainless steel column 5 cm × 4.6 mm, packed with phenyl stationary phase bonded to porous silica (3µm),
- column temperature 45°,
- mobile phase: a mixture of 55 volumes of a buffer solution prepared by dissolving 3.4 g of *sodium acetate trihydrate* and 0.94 g of *sodium 1-hexanesulphonate* to 1000 ml with *water* and adjusting the pH to 4.0 with *dilute hydrochloric acid*, and 45 volumes of *acetonitrile*.
- flow rate. 2.5 ml per minute,
- spectrophotometer set at 239 nm,
- injection volume. 10 µl.

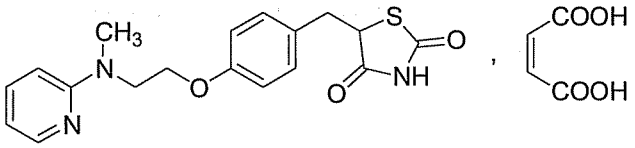
Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{37}H_{48}N_6O_5S_2$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Rosiglitazone Maleate



$C_{18}H_{19}N_3O_3S,C_4H_4O_4$ Mol. Wt. 473.5

Rosiglitazone Maleate is (*RS*)-5-{*p*-[2-(methyl-2-pyridylamino) ethoxy]benzyl}-2,4-thiazolidinedione maleate (1:1).

Rosiglitazone Maleate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{18}H_{19}N_3O_3S,C_4H_4O_4$, calculated on the anhydrous basis.

Category. Antidibatic

Description. A white to off-white crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *rosiglitazone maleate RS*.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 50 ml of mobile phase.

Reference solution (a). A 0.05 per cent w/v solution of *rosiglitazone maleate RS* in the mobile phase.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with mobile phase.

Use the chromatographic system described under Assay.

Inject reference solution (b). The test is not valid unless the tailing factor is not more than 2.0 and the column efficiency in not less than 2000 theoretical plates.

Inject the test solution and reference solution (b). In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than the area of the peak in the chromatogram obtained with the reference solution (b) (1.0 per cent). Ignore any peak (due to maleic acid) with a relative retention time of about 0.4.

Heavy metals (2.3.13). 1 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in 100.0 ml of mobile phase.

Reference solution. A 0.020 per cent w/v solution of *rosiglitazone maleate RS* in mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of *buffer solution* prepared by dissolving 1.36 g of *potassium dihydrogen orthophosphate* in 1000 ml of *water* and adjust the pH to 3.0 with *dilute phosphoric acid*, 25 volumes of *acetonitrile* and 10 volumes of *methanol*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume. 10 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{18}H_{19}N_3O_3S,C_4H_4O_4$.

Storage. Store protected from light.

Rosiglitazone Tablets

Rosiglitazone Maleate Tablets

Rosiglitazone Tablets contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of rosiglitazone, $C_{18}H_{19}N_3O_3S$.

Usual strengths. 1 mg; 2 mg; 4 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1,
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 75 rpm for 30 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc having an average pore diameter not greater than 1.0 µm, rejecting the first 1 ml of the filtrate. Dilute the filtrate, if necessary, with the same solvent. Measure

the absorbance of the resulting solution at the maximum at about 318 nm (2.4.7). Similarly measure the absorbance of a standard solution of known concentration of *rosiglitazone maleate RS* and calculate the content of $C_{18}H_{19}N_3O_3S$.

D. Not less than 70 per cent of the stated amount of $C_{18}H_{19}N_3O_3S$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh accurately a quantity of powdered tablets containing 200 mg of Rosiglitazone, disperse in 100.0 ml of mobile phase. Centrifuge and use clear supernatant liquid.

Reference solution (a). A 0.2 per cent w/v solution of *rosiglitazone maleate RS* in the mobile phase.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with mobile phase.

Use the chromatographic system described under Assay.

Inject reference solution (b). The test is not valid unless the tailing factor is not more than 2.0 and the column efficiency in not less than 2000 theoretical plates.

Inject the test solution and reference solution (b). In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the peak in the chromatogram obtained with the reference solution (b) (2.0 per cent). Ignore any peak (due to maleic acid) with a relative retention time of about 0.4.

Uniformity of content. Comply with the tests stated under Tablets.

Disperse 1 tablet in *0.1 M hydrochloric acid* to produce 0.004 per cent w/v solution. Measure the absorbance of the resulting solution at the maximum at about 318 nm (2.4.7). Calculate the content of $C_{18}H_{19}N_3O_3S$ from the absorbance obtained from same concentration of *rosiglitazone maleate RS* in the same medium.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh accurately a quantity of powdered tablets containing 20 mg of Rosiglitazone, disperse in 100.0 ml of mobile phase. Centrifuge and use clear supernatant liquid.

Reference solution. A 0.020 per cent w/v solution of *rosiglitazone maleate RS* in mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm packed with octadecysilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 65 volumes of *0.01 M potassium hydrogen phosphate* adjusted to pH 3.0 with *orthophosphoric acid*, 25 volumes of *acetonitrile* and 10 volumes of *methanol*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume. 10 µl.

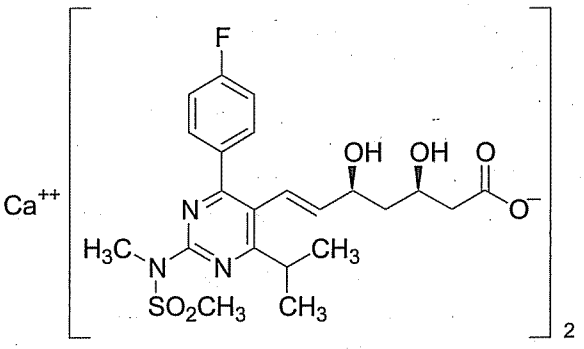
Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency in not less than 4000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{18}H_{19}N_3O_3S$.

Storage. Store protected from light and moisture.

Rosuvastatin Calcium



$(C_{22}H_{27}FN_3O_6S)_2.Ca$ Mol. Wt. 1001.1

Rosuvastatin Calcium is (*E*)-(3*R*,5*S*)-7-{4-(4-fluorophenyl)-6-isopropyl-2-{methyl(methylsulphonylamino)]pyrimidin-5-yl}-3,5-dihydroxyhepten-6-oic acid calcium.

Rosuvastatin Calcium contains not less than 98.0 per cent and not more than 102.0 per cent of $(C_{22}H_{27}FN_3O_6S)_2.Ca$. calculated on the anhydrous basis.

Category. Antihyperlipidaemic.

Description. An off- white to creamish white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *rosuvastatin calcium RS*.

B. Dissolve 20 mg in 25 ml of *methanol*, add 2 drops of *methyl red indicator* neutralise with *6 M ammonium hydroxide*. Add *3 M hydrochloric acid* until the solution is acidic to the

indicator. Add *ammonium oxalate solution*, a white precipitate is obtained.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 100 ml of the mobile phase.

Reference solution (a). A 0.05 per cent w/v solution of *rosuvastatin calcium RS* in the mobile phase.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of 0.2 per cent w/v *acetic acid* in *water*, 25 volumes of *acetonitrile* and 25 volumes of *methanol,*
- flow rate. 1 ml per minute,
- spectrophotometer set at 248 nm,
- injection volume. 20 µl.

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 2.0 and the column efficiency in not less than 2000 theoretical plates.

Inject the test solution and reference solution (b). In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.5 times the area of the peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the sum of areas of all the secondary peaks is not more than twice the area of the peak in the chromatogram obtained with the reference solution (b) (2.0 per cent).

Water (2.3.43). Not more than 8.0 per cent, determined on 0.3 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 100.0 ml of mobile phase. Dilute 5.0 ml of the solution to 25.0 ml with mobile phase, mix and filter.

Reference solution. A 0.05 per cent w/v of *rosuvastatin calcium RS* in mobile phase. Dilute 5.0 ml of the solution to 25.0 ml with mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 50 volumes of 0.2 per cent *acetic acid* in *water,* 25 volumes of *acetonitrile* and 25 volumes of *methanol*, filter and degas.
- flow rate. 1 ml per minute,
- spectrophotometer set at 248 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $(C_{22}H_{27}FN_3O_6S)_2.Ca$.

Storage. Store protected from light and moisture.

Rosuvastatin Tablets

Rosuvastatin Calcium Tablets

Rosuvastatin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of rosuvastatin, $C_{44}H_{54}F_2N_6O_{12}S_2$.

Usual strengths. 5 mg; 10 mg; 20 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1,
Medium. 900 ml of phosphate buffer pH 6.8,
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. The filtrate obtained as given above.

Reference solution. A 0.05 per cent w/v solution of *rosuvastatin calcium RS* in the mobile phase. Dilute 2 ml of the solution to 100 ml with Dissolution medium.

Chromatographic system as described under Assay.

Calculate the content of $C_{44}H_{54}F_2N_6O_{12}S_2$.

D. Not less than 70 per cent of the stated amount of $C_{44}H_{54}F_2N_6O_{12}S_2$.

Uniformity of content. Comply with the tests stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay.

Test solution. Disperse one tablet in 100 ml of the mobile phase. Dilute 5 ml of the solution to 10 ml with mobile phase and filter.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh accurately a quantity of powdered tablet containing 25 mg of Rosuvastatin, disperse in 50 ml of mobile phase and filter.

Reference solution (a). A 0.05 per cent w/v solution of *rosuvastatin calcium RS* in the mobile phase.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with mobile phase.

Chromatographic system as described under Assay.

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 2.0 and the column efficiency in not less than 2000 theoretical plates.

Inject the test solution and reference solution (b). In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 1.5 times the area of the peak in the chromatogram obtained with reference solution (b) (1.5 per cent) and the sum of areas of all the secondary peaks is not more than 3.0 times the area of the peak in the chromatogram obtained with the reference solution (b) (3.0 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh accurately a quantity of powdered tablet containing 25 mg of Rosuvastatin, disperse in 100.0 ml of mobile phase. Dilute 5.0 ml of the solution to 25.0 ml with mobile phase and filter.

Reference solution. A 0.025 per cent w/v solution of *rosuvastatin calcium RS* in mobile phase. Dilute 5.0 ml of the solution to 25.0 ml with mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature 30°,
- mobile phase: a mixture of 585 volumes of a buffer solution prepared by dissolving 1.54 g of *ammonium acetate* in 900 ml *water*, adjust pH to 4.0 with *glacial acetic acid* and dilute to 1000 ml with *water*, 360 volumes of *acetonitrile* and 50 volumes of *tetrahydrofurane*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 248 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

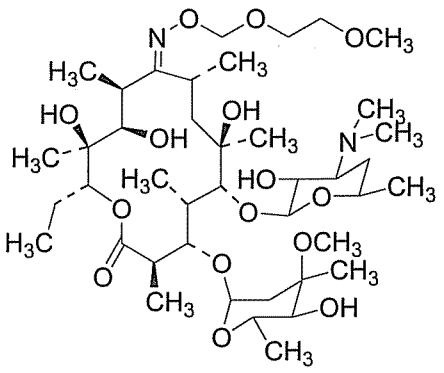
Inject the test solution and the reference solution.

Calculate the content of $C_{44}H_{54}F_2N_6O_{12}S_2$.

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of the equivalent amount of Rosuvastatin.

Roxithromycin



$C_{41}H_{76}N_2O_{15}$ Mol. Wt. 837.0

Roxithromycin is (3*R*,4*S*,5*S*,6*R*,7*R*,9*R*,11*S*,12*R*,13*S*,14*R*)-4-[(2,6-dideoxy-3-*C*-methyl-3-*O*-methyl-α-L-*ribo*-hexopyranosyl)oxy]-14-ethyl-7,12,13-trihydroxy-10-[(*E*)-[(2-methoxyethoxy)methoxy]imino]-3,5,7,9,11,13-hexamethyl-6-[[3,4,6-trideoxy-3-(dimethylamino)-β-D-*xylo*-hexopyranosyl]oxy]oxacyclotetradecan-2-one; erythromycin 9-(*E*)-[*O*-[(2-methoxyethoxy)methyl]oxime].

Roxithromycin contains not less than 96.0 per cent and not more than 102.0 per cent of $C_{41}H_{76}N_2O_{15}$, calculated on the anhydrous basis.

Category. Antibacterial.

Dose. 150 mg twice a day.

Description. A white, crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *roxithromycin RS*.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Appearance of solution. A 1.0 per cent w/v solution in *methanol* is clear (2.4.1) and colourless (2.4.1).

Specific optical rotation (2.4.22). – 93.0° to – 96.0°, determined in a 1.0 per cent w/v solution in *acetone*.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. Mix 30 volumes of *acetonitrile* and 70 volumes of a 4.8 per cent w/v solution of *ammonium dihydrogen phosphate* and adjust the pH to 5.3 with *dilute sodium hydroxide solution*.

Test solution. Dissolve 50.0 mg of the substance under examination in 25.0 ml of the solvent mixture.

Reference solution (a). A 0.2 per cent w/v solution of *roxithromycin RS* in the solvent mixture.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with the solvent mixture.

Reference solution (c). Dissolve 2 mg of *erythromycin 9-(E)-[O-[[(2-methoxyethoxy)methoxy]methyl]oxime] (impurity A)* in 10 ml of reference solution (a). Further dilute 1 ml of this solution to 10 ml with reference solution (a).

Reference solution (d). Dilute 1.0 ml of *toluene* to 100 ml with *acetonitrile*. Dilute 0.2 ml of this solution to 200 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 15 cm x 4.6 mm, packed with spherical end-capped octadecylsilane bonded to porous silica (5 µm), with a 10 nm pore size and a carbon loading of about 19 per cent,
- column temperature. 15°,
- mobile phase: A. a mixture of 26 volumes of *acetonitrile* and 74 volumes of a 5.97 per cent w/v solution of *ammonium dihydrogen phosphate*, adjusted to pH 4.3 with *dilute sodium hydroxide solution*,
  B. a mixture of 30 volumes of *water* and 70 volumes of *acetonitrile*,
- flow rate.1.1 ml per minute,
- a linear gradient programme using the conditions given below,
- spectrophotometer set at 205 nm,
- injection volume. 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
50	100	0
80	90	10
100	100	0

Inject reference solution (c). Relative retention time between roxithromycin and erythromycin 9-(E)-[O-[[(2-methoxyethoxy) methoxy]methyl] oxime] (impurity A) is about 1.15. The test is not valid unless the peak-to-valley ratio H_p / H_v is not more than 2.0, where H_p = height above the baseline of the peak due to impurity A and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to roxithromycin.

Inject the test solution and reference solutions (b) and (d). In the chromatogram obtained with the test solution the area of the impurity A peak obtained immediately after the peak obtained with roxithromycin is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). The area of any other individual impurity peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). The sum of the areas of all the peaks is not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent). Ignore any peak with an area 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent). Ignore any peak due to toluene identified using reference solution (d).

Heavy metals (2.3.13). Dissolve 2.0 g in a mixture of 15 volumes of *water* and 85 volumes of *acetone* and dilute to 20 ml with the same solvent mixture. 12 ml of this solution complies with the limit test for heavy metals, Method A (10 ppm). Use 1 ml of *lead standard solution (10 ppm lead)* prepared by diluting *lead standard solution (100 ppm lead)* with a mixture of 15 volumes of *water* and 85 volumes of *acetone*.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 3.0 per cent, determined on 0.2 g.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Mix 30 volumes of *acetonitrile* and 70 volumes of a 4.8 per cent w/v solution of *ammonium dihydrogen phosphate* and adjust the pH to 5.3 with *dilute sodium hydroxide solution*.

Test solution. Dissolve 50.0 mg of the substance under examination in 25.0 ml of the solvent mixture.

Reference solution (a). A 0.2 per cent w/v solution of *roxithromycin RS* in the solvent mixture.

Reference solution (b). Dissolve 2 mg of *erythromycin 9-(E)-[O-[[(2-methoxyethoxy)methoxy]methyl]oxime] (impurity A)* in 10.0 ml of reference solution (a). Further dilute 1.0 ml of this solution to 10.0 ml with reference solution (a).

Chromatographic system
- a stainless steel column 15 cm × 4.6 mm, packed with spherical end-capped octadecylsilane bonded to porous silica (5 µm), with a 10 nm pore size and a carbon loading of about 19 per cent,
- column temperature 15°,
- mobile phase: mix 307 volumes of *acetonitrile* and 693 volumes of a 4.91 per cent w/v solution of *ammonium dihydrogen phosphate* adjusted to pH 5.3 with *dilute sodium hydroxide solution*,
- flow rate.1.5 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume. 20 µl.

Inject reference solution (b). The test is not valid unless the peak-to-valley ratio H_p / H_v is not less than 1.5.

Inject the test solution and reference solution (a)

Calculate the content of $C_{14}H_{26}N_2O_{15}$.

Storage. Store protected from light and moisture.

Roxithromycin Tablets

Roxithromycin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of roxithromycin, $C_{41}H_{76}N_2O_{15}$.

Usual strengths. 150 mg; 300 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apprartus No. 1,
Medium. 900 ml of *phosphate buffer pH 6.0*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. The filtrate obtained as given above.

Reference solution. A 0.0166 per cent w/v solution of *roxithromycin RS* in the dissolution medium.

Chromatographic system as described under Assay.

Inject the test solution and the reference solution.

Calculate the content of $C_{41}H_{76}N_2O_{15}$ in the medium.

D. Not less than 70 per cent of the stated amount of $C_{41}H_{76}N_2O_{15}$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. Mix 30 volumes of *acetonitrile* and 70 volumes of a 4.8 per cent w/v solution of *ammonium dihydrogen phosphate* and adjust the pH to 5.3 with *dilute sodium hydroxide solution.*

Test solution. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 0.2 g of Roxithromycin, add 80 ml of the solvent mixture and mix. Dilute to 100.0 ml with the solvent mixture and filter.

Reference solution (a). A 0.2 per cent w/v solution of *roxithromycin RS* in the solvent mixture.

Reference solution (b). Dissolve 2 mg of *erythromycin 9-(E)-[O-[[(2-methoxyethoxy)methoxy]methyl]oxime] (impurity A)* in 10 ml of reference solution (a). Further dilute 1 ml of this solution to 10 ml with reference solution (a).

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with spherical end-capped octadecylsilane bonded to porous silica (5 µm), with a 10 nm pore size and a carbon loading of about 19 per cent,
- column temperature. 15°,
- mobile phase: mix 307 volumes of *acetonitrile* and 693 volumes of a 4.91 per cent w/v solution of *ammonium dihydrogen phosphate* adjusted to pH 5.3 with *dilute sodium hydroxide solution*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 205 nm,
- injection volume. 20 µl.

Inject reference solution (b). The relative retention time between roxithromycin and erythromycin-(E)-[O-[[(2-methoxyethoxy)methoxy]methyl]oxime] (impurity A) is about 1.15. The test is not valid unless the peak-to-valley ratio H_p / H_v is not more than 1.5, where H_p = height above the baseline of the peak due to impurity A and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to roxithromycin.

Inject reference solution (a). The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and reference solution (a).

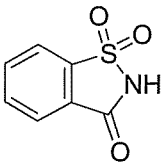
Calculate the content of $C_{41}H_{76}N_2O_{15}$ in the tablets.

Storage. Store protected from light and moisture.

Labelling. If the tablets are dispersible, the label states that the tablets should be dispersed in water immediately before use.

S

Saccharin



$C_7H_5NO_3S$ Mol. Wt. 183.2

Saccharin is 1,2-benzisothiazol-3(2*H*)-one 1,1-dioxide.

Saccharin contains not less than 98.0 per cent and not more than 101.0 per cent of $C_7H_5NO_3S$, calculated on the dried basis.

Category. Pharmaceutical aid (sweetening agent).

Description. White crystals or a white, crystalline powder; odourless or with a faint, aromatic odour.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *saccharin RS*.

B. Mix 20 mg with 20 mg of *resorcinol*, add 0.5 ml of *sulphuric acid* and heat over a small flame until a dark green colour is produced; allow to cool and add 10 ml of *water* and an excess of *2 M sodium hydroxide*; a fluorescent green liquid is produced.

C. Dissolve 0.1 g in 5 ml of a 10 per cent w/v solution of *sodium hydroxide*, evaporate to dryness and gently fuse the residue over a small flame until ammonia is no longer evolved. Allow to cool, dissolve in 20 ml of *water*, make the solution just acidic to litmus paper, filter and add 0.05 ml of *ferric chloride solution*; a violet colour is produced.

D. A saturated solution is acidic to *litmus paper*.

Tests

Appearance of solution. Dissolve 5.0 g in 20 ml of a 20 per cent w/v solution of *sodium acetate* and dilute to 25 ml with the same solution; the solution is clear (2.4.1), and colourless (2.4.1).

Related substances. Determine by gas chromatography (2.4.13).

Internal standard solution. Dissolve 25 mg of *caffeine* in *dichloromethane* and dilute to 100 ml with the same solvent.

Test solution. Suspend 10.0 g of the substance under examination in 20 ml of *water* and dissolve using about 5 ml of *strong sodium hydroxide solution*. If necessary, adjust the pH of the solution to 7.8 with *1 M sodium hydroxide* or *1 M hydrochloric acid* and dilute to 50 ml with *water*. Shake the solution with 4 quantities, each of 50 ml, of *dichloromethane*. Combine the lower layers, dry over *anhydrous sodium sulphate* and filter. Wah the filter and the sodium sulphate with 10 ml of *dichloromethane*. Combine the solution and the washings and evaporate almost to dryness in a water-bath at a temperature not exceeding 40°. With a small quantity of *dichloromethane* transfer quantitatively the residue into a suitable 10-ml tube, evaporate to dryness in a current of *nitrogen* and dissolve the residue in 1.0 ml of the internal standard solution.

Blank solution. Evaporate 200 ml of *dichloromethane* to dryness in a water-bath at a temperature not exceeding 40°. Dissolve the residue in 1 ml of *dichloromethane*.

Reference solution. Dissolve 20 mg of *o-toluenesulphonamide* and 20 mg of *p-toluene sulphonamide* in *dichloromethane* and dilute to 100 ml with the same solvent. Dilute 5 ml of the solution to 50 ml with dichloromethane. Evaporate 5 ml of the final solution to dryness in a current of *nitrogen*. Dissolve the residue in 1 ml of the internal standard solution.

Chromatographic system
- a fused silica column 10 m × 0.53 mm packed with polymethylphenylsiloxane (film thickness 2 µm),
- temperature:
  column.180°,
  inlet port and detector. 250°,
- flame ionization detector,
- flow rate. 10 ml per minute of nitrogen (carrier gas),
- split ratio. 1:2.

Inject 1 µl of each solution. The order of elution is o-toluenesulphonamide, p-toluenesulphonamide, caffeine.

The test is not valid unless the resolution between the peaks due to o-toluenesulphonamide and p-toluenesulphonamide in the chromatogram obtained with the reference solution is not less than 1.5 and the chromatogram obtained with the blank solution does not show any peak with the same retention times as the internal standard, o-toluenesulphonamide and p-toluenesulphonamide.

In the chromatogram obtained with the test solution the ratio of the area of the peak due to o-toluenesulphonamide to that of the internal standard is not greater than the corresponding ratio in the chromatogram obtained with the rference solution (10 ppm).

In the chromatogram obtained with the test solution the ratio of the area of the peak due to p-toluenesulphonamide to that of the internal standard is not greater than the corresponding ratio in the chromatogram obtained with the reference solution (10 ppm).

Arsenic (2.3.10). Mix 5.0 g with 3.0 g of *anhydrous sodium carbonate*, add 10 ml of *bromine solution* and mix thoroughly.

Evaporate to dryness on a water-bath, gently ignite and add to the cooled residue a mixture of 16 ml of *brominated hydrochloric acid AsT* and 5 ml of *bromine solution*. Add 40 ml of *water* and boil gently, adding sufficient bromine solution from time to time to maintain a slight excess. Filter and remove the excess of bromine with a sufficient quantity of *stannous chloride solution AsT*. The resulting solution complies with the limit test for arsenic (2 ppm).

Heavy metals (2.3.13). 1.2 g complies with the limit test for heavy metals, Method D (20 ppm). Use *lead standard solution (2 ppm Pb)*.

Readily carbonisable substances. Dissolve 0.2 g in 5 ml of *sulphuric acid (96 per cent w/w)* and maintain at about 50° for 10 minutes. The solution is not more intensely coloured than reference solution BYS6 (2.4.1).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 4 hours.

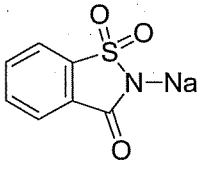
Assay. Weigh accurately about 0.5 g, dissolve in 75 ml of hot *water*, cool quickly and titrate with *0.1 M sodium hydroxide* using *phenolphthalein solution* as indicator.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01832 g of $C_7H_5NO_3S$.

Storage. Store protected from moisture.

Saccharin Sodium

Soluble Saccharin



$C_7H_4NNaO_3S$ Mol. Wt. 205.2

Saccharin Sodium is the sodium salt of 1,2-benzisothiazol-3(2*H*)-3-one 1,1-dioxide.

Saccharin Sodium contains not less than 99.0 per cent and not more than 101.0 per cent of $C_7H_4NNaO_3S$, calculated on the anhydrous basis.

Category. Pharmaceutical aid (sweetening agent).

Description. A white, crystalline powder or colourless crystals; efflorescent in dry air.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B, C and D may be omitted if tests A and E are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *saccharin sodium RS*.

B. Dissolve 0.1 g in 5 ml of a 10 per cent w/v solution of *sodium hydroxide*, evaporate to dryness and gently fuse the residue over a small flame until ammonia is no longer evolved. Allow to cool, dissolve in 20 ml of *water*, make the solution just acidic to *litmus paper*, filter and add 0.05 ml of *ferric chloride solution*; a violet colour is produced.

C. Mix 20 mg with 20 mg of *resorcinol*, add 0.5 ml of *sulphuric acid* and heat over a small flame until a dark green colour is produced; allow to cool and add 10 ml of *water* and an excess of *2 M sodium hydroxide*; a fluorescent green liquid is produced.

D. To 5 ml of a 10 per cent w/v solution add 3 ml of *2 M hydrochloric acid*; a white precipitate is produced. The precipitate, after washing with *water* and drying at 105° melts at 226° to 230° (2.4.21).

E. 0.5 ml of a 10 per cent w/v solution gives reaction B of sodium salts (2.3.1).

Tests

Appearance of solution. Solution A is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. Dissolve 5.0 g in sufficient *carbon dioxide-free water* to produce 50 ml (solution A). To 10 ml of solution A add 5 ml of *0.005 M sulphuric acid*, heat to boiling, cool and add 0.1 ml of *phenolphthalein solution*. Not less than 4.5 ml and not more than 5.5 ml of *0.01 M sodium hydroxide* is required to change the colour of the solution to pink.

Related substances. Determine by gas chromatography (2.4.13).

Internal standard solution. Dissolve 25 mg of *caffeine* in *dichloromethane* and dilute to 100 ml with the same solvent.

Test solution. Suspend 10.0 g of the substance under examination in 50 ml of *water*. If necessary, adjust the pH of the solution to 7.8 with *1 M sodium hydroxide* or *1 M hydrochloric acid* and dilute to 50 ml with *water*. Shake the solution with 4 quantities, each of 50 ml, of *dichloromethane*. Combine the lower layers, dry over *anhydrous sodium sulphate* and filter. Wah the filter and the sodium sulphate with 10 ml of *dichloromethane*. Combine the solution and the washings and evaporate almost to dryness in a water-bath at a

temperature not exceeding 40°. With a small quantity of *dichloromethane* transfer quantitatively the residue into a suitable 10-ml tube, evaporate to dryness in a current of *nitrogen* and dissolve the residue in 1.0 ml of the internal standard solution.

Blank solution. Evaporate 200 ml of *dichloromethane* to dryness in a water-bath at a temperature not exceeding 40°. Dissolve the residue in 1 ml of *dichloromethane.*

Reference solution. Dissolve 20 mg of *o-toluenesulphonamide* and 20 mg of *p-toluene sulphonamide* in *dichloromethane* and dilute to 100 ml with the same solvent. Dilute 5 ml of this solution to 50 ml with *dichloromethane.* Evaporate 5 ml of the final solution to dryness in a current of *nitrogen.* Dissolve the residue in 1 ml of the internal standard solution.

Chromatographic system
- a fused silica column 10 m x 0.53 mm packed with polymethylphenylsiloxane (film thickness 2 µm),
- temperature:
  column.180°,
  inlet port and detector. 250°
  flame ionization detector,
- flow rate. 10 ml per minute of nitrogen (carrier gas),
- split ratio. 1:2.

Inject 1 µl of each solution. The order of elution is o-toluenesulphonamide, p-toluenesulphonamide, caffeine.

The test is not valid unless the resolution between the peaks due to o-toluenesulphonamide and p-toluenesulphonamide in the chromatogram obtained with the reference solution is not less than 1.5 and the chromatogram obtained with the blank solution does not show any peak with the same retention times as the internal standard, o-toluenesulphonamide and p-toluenesulphonamide.

In the chromatogram obtained with the test solution the ratio of the area of the peak due to o-toluenesulphonamide to that of the internal standard is not greater than the corresponding ratio in the chromatogram obtained with the reference solution (10 ppm).

In the chromatogram obtained with the test solution the ratio of the area of the peak due to p-toluenesulphonamide to that of the internal standard is not greater than the corresponding ratio in the chromatogram obtained with the rference solution (10 ppm).

Arsenic (2.3.10). Mix 5.0 g with 3 g of *anhydrous sodium carbonate,* add 10 ml of *bromine solution* and mix thoroughly. Evaporate to dryness on a water-bath, gently ignite and add to the cooled residue a mixture of 16 ml of *brominated hydrochloric acid AsT* and 5 ml of *bromine solution.* Add 40 ml of water and boil gently, adding sufficient *bromine solution* from time to time to maintain a slight excess. Filter and remove the excess of bromine with a sufficient quantity of *stannous chloride solution AsT.* The resulting solution complies with the limit test for arsenic (2 ppm).

Readily carbonisable substances. Dissolve 0.2 g in 5 ml of *sulphuric acid (96 per cent w/w)* and maintain at about 50° for 10 minutes. The solution is not more intensely coloured than reference solution BS6 (2.4.1).

Heavy metals (2.3.13). 12 ml of solution A complies with the limit test for heavy metals, Method D (20 ppm). Use *lead standard solution (2 ppm Pb).*

Water (2.3.43). Not more than 15.0 per cent, determined on 0.2 g.

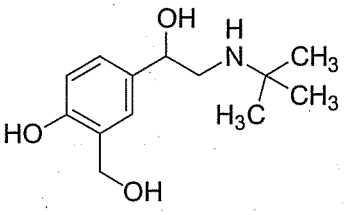
Assay. Weigh accurately about 0.15 g, dissolve in 50 ml of *anhydrous glacial acetic acid,* with slight heating if necessary. Titrate with *0.1 M perchloric acid,* determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02052 g of $C_7H_4NNaO_3S$.

Storage. Store protected from moisture.

Salbutamol

Albuterol



$C_{13}H_{21}NO_3$ Mol. Wt. 239.3

Salbutamol is (*RS*)-1-(4-hydroxy-3-hydroxymethylphenyl)-2-(*tert*-butylamino)ethanol.

Salbutamol contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{13}H_{21}NO_3$, calculated on the dried basis.

Category. Beta-adrenoceptor agonist.

Dose. Orally, 6 to 16 mg daily, in divided doses; by inhalation, for chronic bronchial asthma or as a prophylactic, 2 inhalations of 100 µg, 3 or 4 times daily; for the relief of acute bronchospasm, 1 or 2 inhalations of 100 µg as a single dose when required, up to a maximum of 8 inhalations in 24 hours; by subcutaneous or intramuscular injection, 500 µg, repeated every 4 hours, if necessary; by slow intravenous injection, 250 µg, repeated if necessary.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6), Compare the spectrum with that obtained with *salbutamol RS* or with the reference spectrum of salbutamol.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.008 per cent w/v solution in *0.1 M hydrochloric acid* shows an absorption maximum only at about 276 nm; absorbance at about 276 nm, about 0.53 to 0.60.

C. In the test for Related substances, the principal spot in the chromatogram obtained with reference solution (a) corresponds to that in the chromatogram obtained with reference solution (b).

D. Dissolve 10 mg in 50 ml of a 2 per cent w/v solution of *borax*, add 1 ml of a 3 per cent w/v solution of *4-aminophenazone*, 10 ml of a 2 per cent w/v solution of *potassium ferricyanide* and 10 ml of *chloroform*, shake and allow to separate; an orange-red colour is produced in the chloroform layer.

Tests

Appearance of solution. A 2.0 per cent w/v solution in *methanol* is clear (2.4.1), and not more intensely coloured than reference solution BYS5 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in 50.0 ml of the mobile phase.

Reference solution. A solution containing 0.02 per cent w/v each of *salbutamol RS* and *(1RS)-2-[(1,1-dimethylethyl)amino]-1-(4- hydroxyphenyl)ethanol RS (salbutamol impurity A RS)* in the mobile phase. Dilute 2.0 ml of this solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 3.9 mm, packed with endcapped octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 22 volumes of *acetonitrile* and 78 volumes of a solution containing 0.29 per cent w/v of *sodium heptanesulphonate* and 0.25 per cent w/v of *potassium dihydrogen phosphate,* adjusted to pH 3.7 with *orthophosphoric acid,*
- flow rate: 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to due to salbutamol and salbutamol impurity A is not less than 3.0. The relative retention time with reference to salbutamol for salbutamol impurity A is about 1.3.

Inject the test solution and the reference solution. Run the chromatogram 25 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.3 per cent) and the sum of areas of all the secondary peaks is not more than 3.3 times the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak with an area less than 0.05 per cent the area of the principal peak in the chromatogram obtained with the reference solution.

Boron. To 50 mg add 5 ml of a solution containing 1.3 per cent w/v of *anhydrous sodium carbonate* and 1.7 per cent w/v of *potassium carbonate*, evaporate to dryness on a water-bath and dry at 120°. Ignite the residue rapidly until the organic matter has been destroyed, allow to cool, add 0.5 ml of *water* and 3.0 ml of a freshly prepared 0.125 per cent w/v solution of *curcumin* in *glacial acetic acid.* Evaporate to dryness and allow to cool. Add 3 ml of a mixture prepared by adding 5 ml of *sulphuric acid*, slowly and with stirring, to 5 ml of *glacial acetic acid.* Mix and allow to stand for 30 minutes. Add sufficient *ethanol (95 per cent)* to produce 100.0 ml, filter and measure the absorbance of the filtrate at 555 nm (2.4.7). Prepare a reference solution in the following manner. Dissolve 0.572 g of *boric acid* in 1000.0 ml of *water*. Dilute 1.0 ml to 100.0 ml with water. To 2.5 ml of this solution add 5 ml of a solution containing 1.3 per cent w/v of *anhydrous sodium carbonate* and 1.7 per cent w/v of *potassium carbonate* and treat this mixture in the same manner as described above beginning at the words "Evaporate to dryness...". The absorbance of the solution prepared from the substance under examination is not more than that of the reference solution (50 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.2 g, dissolve in 30 ml of *anhydrous glacial acetic acid.* Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02393 g of $C_{13}H_{21}NO_3$.

Storage. Store protected from light.

Salbutamol Inhalation

Salbutamol Inhalation Aerosol; Albuterol Inhalation Aerosol

Salbutamol Inhalation is a suspension of microfine Salbutamol or Salbutamol Sulphate in a suitable liquid in a suitable

pressurised container. It may contain suitable pharmaceutical aids such as surfactants, stabilising agents etc.

Salbutamol Inhalation delivers not less than 80.0 per cent and not more than 120.0 per cent of the stated amount of salbutamol, $C_{13}H_{21}NO_3$, per inhalation, by actuation of the valve.

Usual strength. 100 µg in each metered-dose.

Identification

A. Discharge the container a sufficient number of times into a mortar to obtain about 2 mg of salbutamol, grind the residue thoroughly with 0.1 g of potassium bromide, add a further 0.2 g of potassium bromide and mix thoroughly.

On the resultant dispersion determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *salbutamol RS* or with the reference spectrum of salbutamol.

B. In the test for Related substances, the principal spot in the chromatogram obtained with reference solution (a) corresponds to that in the chromatogram obtained with reference solution (b).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 50 volumes of *ethyl acetate*, 30 volumes of *2-propanol*, 16 volumes of *water* and 4 volumes of *strong ammonia solution*.

Test solution. Discharge the inhaler a sufficient number of times into a small, dry beaker to obtain 10 mg of Salbutamol and dissolve the residue in 0.5 ml of *methanol*.

Reference solution (a). Dilute 1.0 volume of test solution (a) to 200 volumes with *methanol*.

Reference solution (b). A 0.010 per cent w/v solution of *salbutamol RS* in *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air until the odour of the solvent is no longer detectable, place it for a few minutes in an atmosphere saturated with *diethylamine* and spray with *diazotised sulphanilic acid solution*. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (a). Ignore any spot with an R_f value higher than 0.85.

Other tests. Complies with the tests stated under Inhalation Preparations (Pressurised metered-dose Preparations).

Follow the procedure described under Assay wherever the amount of active substance is to be determined in any test.

Assay. Carry out the test for Content of active ingredient delivered per actuation stated under Inhalation Preparations (Pressurised metered-dose Preparations).

Use 30 ml of *ethanol* for preparations containing salbutamol and 30 ml of a mixture of equal volumes of *ethanol* and *water* for preparations containing salbutamol sulphate and dilute the final solution and washings to 200.0 ml with *ethanol*. Dilute a suitable volume of this solution with *ethanol* to produce a solution containing 10 µg of salbutamol per ml. To 20 ml of the solution in a separating funnel add 180 ml of *water* and in the following order, 4 ml of *N,N-dimethyl-4-phenylenediamine sulphate solution* and 4 ml of a freshly prepared 8 per cent w/v solution of *potassium ferricyanide*. Mix, allow to stand for 15 minutes in subdued light and extract with two quantities, each of 10 ml, of *chloroform*. Filter the extracts through a plug of *cotton wool*, dilute to 25 ml with *chloroform* and measure the absorbance of the resulting solution at 605 nm (2.4.7). Calculate the content of $C_{13}H_{21}NO_3$ in the solution from the absorbance obtained by repeating the operation using a suitable quantity of a 0.001 per cent w/v solution of *salbutamol RS* in *ethanol*.

Calculate the amount of $C_{13}H_{21}NO_3$ delivered per actuation of the valve.

Determine the content of active ingredient a second and third time by repeating the procedure on the middle ten and on the last ten successive combined actuations of the valve. For each of the three determinations the average content of $C_{13}H_{21}NO_3$ delivered per actuation of the valve meets the requirements.

Storage. Store protected from light and moisture at a temperature not exceeding 30°.

Labelling. The label states whether the preparation contains Salbutamol or Salbutamol Sulphate.

When the active ingredient is Salbutamol Sulphate, the quantity is stated in terms of the equivalent amount of salbutamol.

Salbutamol Sulphate

Albuterol Sulphate

$(C_{13}H_{21}NO_3)_2,H_2SO_4$ Mol. Wt. 576.7

Salbutamol Sulphate is (*RS*)-1-(4-hydroxy-3-hydroxymethylphenyl)-2-(*tert*-butylamino)ethanol sulphate.

Salbutamol Sulphate contains not less than 98.0 per cent and not more than 101.0 per cent of $(C_{13}H_{21}NO_3)_2, H_2SO_4$, calculated on the dried basis.

Category. Beta-adrenoceptor agonist.

Dose. Orally, the equivalent of 6 to 16 mg of salbutamol daily, in divided doses; by slow intravenous injection, the equivalent of 250 µg of salbutamol or by intravenous infusion, the equivalent of 3 to 20 µg of salbutamol per minute. (1 mg of Salbutamol Sulphate is approximately equivalent to 830 µg of salbutamol).

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C, D and E are carried out. Tests B and C may be omitted if tests A, D and E are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6), Compare the spectrum with that obtained with *salbutamol sulphate RS* or with the reference spectrum of salbutamol sulphate.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.008 per cent w/v solution in *0.1 M hydrochloric acid* shows an absorption maximum at about 276 nm; absorbance at about 276 nm, 0.44 to 0.51.

C. In the test for Related substances, the principal spot in the chromatogram obtained with reference solution (a) corresponds to that in the chromatogram obtained with reference solution (b).

D. Dissolve 10 mg in 50 ml of a 2 per cent w/v solution of *borax*, add 1 ml of a 3 per cent w/v solution of *4-amino-phenazone*, 10 ml of a 2 per cent w/v solution of *potassium ferricyanide* and 10 ml of *chloroform*, shake and allow to separate; an orange-red colour is produced in the chloroform layer.

E. Gives reaction A of sulphates (2.3.1).

Tests

Appearance of solution. A 1.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and not more intensely coloured than reference solution BYS6 (2.4.1).

Acidity or alkalinity. To 10 ml of a 1.0 per cent w/v solution in *carbon dioxide-free water* add 0.15 ml of *methyl red solution* and 0.2 ml of *0.01 M sodium hydroxide*. The solution is yellow and not more than 0.4 ml of *0.01 M hydrochloric acid* is required to change the colour of the solution to red.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in 50.0 ml of the mobile phase.

Reference solution. A solution containing 0.02 per cent w/v each of *salbutamol RS* and *(1RS)-2-[(1,1-dimethylethyl)amino]-1-(4- hydroxyphenyl)ethanol RS (salbutamol impurity A RS)* in the mobile phase. Dilute 2.0 ml of this solution to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 3.9 mm, packed with endcapped octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 22 volumes of *acetonitrile* and 78 volumes of a solution containing 0.29 per cent w/v of *sodium heptanesulphonate* and 0.25 per cent w/v of *potassium dihydrogen phosphate,* adjusted to pH 3.7 with *orthophosphoric acid,*
- flow rate. 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to due to salbutamol and salbutamol impurity A is not less than 3.0. The relative retention time with reference to salbutamol for salbutamol impurity A is about 1.3.

Inject the test solution and the reference solution. Run the chromatogram 25 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.3 per cent) and the sum of areas of all the secondary peaks is not more than 3.3 times the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak with an area less than 0.05 per cent the area of the principal peak in the chromatogram obtained with the reference solution.

Boron. To 50 mg add 5 ml of a solution containing 1.3 per cent w/v of *anhydrous sodium carbonate* and 1.7 per cent w/v of *potassium carbonate*, evaporate to dryness on a water-bath and dry at 120°. Ignite the residue rapidly until the organic matter has been destroyed, allow to cool, add 0.5 ml of *water* and 3.0 ml of a freshly prepared 0.125 per cent w/v solution of *curcumin* in *glacial acetic acid*. Evaporate to dryness and allow to cool. Add 3 ml of a mixture prepared by adding 5 ml of *sulphuric acid*, slowly and with stirring, to 5 ml of *glacial acetic acid*. Mix and allow to stand for 30 minutes. Add sufficient *ethanol (95 per cent)* to produce 100.0 ml, filter and measure the absorbance of the filtrate at 555 nm (2.4.7). Prepare a reference solution in the following manner. Dissolve 0.572 g of *boric acid* in 1000.0 ml of *water*. Dilute 1.0 ml to 100.0 ml with *water*. To 2.5 ml of this solution add 5 ml of a solution containing 1.3 per cent w/v of *anhydrous sodium carbonate* and 1.7 per cent w/v of *potassium carbonate* and treat this mixture in the same manner as described above beginning at the words " Evaporate to dryness.....".The absorbance of the solution prepared from the substance under examination is not more than that of the reference solution (50 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.4 g, dissolve in 5 ml of *anhydrous formic acid*, add 35 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.05767 g of $(C_{13}H_{21}NO_3)_2, H_2SO_4$.

Storage. Store protected from light.

Salbutamol Injection

Albuterol Sulphate Injection; Salbutamol Sulphate Injection

Salbutamol Injection is a sterile solution of Salbutamol Sulphate in Water for Injections containing suitable stabilising agents.

Salbutamol Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of salbutamol, $C_{13}H_{21}NO_3$.

Usual strengths. The equivalent of 250 µg of salbutamol per ml; the equivalent of 500 µg of salbutamol per ml; the equivalent of 5 mg of salbutamol in 5 ml (for intravenous infusion). (1 mg of Salbutamol Sulphate is approximately equivalent to 830 µg of salbutamol).

Identification

A. Dilute a volume with sufficient *0.1 M hydrochloric acid* to produce a solution containing 0.008 per cent w/v of salbutamol. When examined in the range 230nm to 360 nm (2.4.7), the resulting solution shows an absorption maximum only at about 276 nm.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 50 volumes of *ethyl acetate*, 30 volumes of *2-propanol*, 16 volumes of *water* and 4 volumes of *strong ammonia solution*.

Test solution. Evaporate a suitable volume of the injection to dryness using a rotary evaporator, wash the residue with four quantities, each of 5 ml, of *ethanol*, filter, evaporate the filtrate to dryness and dissolve the residue in sufficient *water* to produce a solution containing the equivalent of 0.1 per cent w/v of salbutamol.

Reference solution. A 0.12 per cent w/v solution of *salbutamol sulphate RS* in *water*.

Apply to the plate 2 µl of each solution. After development, dry the plate in air until the odour of solvent is no longer detectable, place for a few minutes in an atmosphere saturated with *diethylamine* and spray with *diazotised nitroaniline solution*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

C. Dilute a volume containing 0.5 mg of salbutamol to 50 ml with water, add 1 ml of *dilute ammonia solution*, 1 ml of a 3 per cent w/v solution of *4-aminophenazone*, 10 ml of a 2 per cent w/v solution of *potassium ferricyanide* and 10 ml of *chloroform*. Shake and allow to separate; an orange-red colour is produced in the chloroform layer.

D. A volume containing 1 mg of salbutamol gives the reactions of sulphates (2.3.1).

Tests

pH (2.4.24). 3.4 to 5.0.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dilute a volume of injection containing about 5 mg of Salbutamol in 100.0 ml of the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). A solution containing 0.0004 per cent w/v of *(1RS)-2-[(1,1-dimethylethyl)amino]-1-(4-hydroxyphenyl)ethanol RS (salbutamol impurity A RS)* and 0.0005 per cent w/v of *salbutamol sulphate RS* in the mobile phase.

Chromatographic system
- a stainless steel column 15 cm x 3.9 mm, packed with endcapped octylsilane bonded to porous silica (5 µm) (such as Waters Symmetry C8),
- mobile phase: a mixture of 22 volumes of *acetonitrile* and 78 volumes of a solution containing 0.29 per cent w/v of *sodium heptanesulphonate* and 0.25 per cent w/v of *potassium dihydrogen phosphate*, adjusted to pH 3.7 with *orthophosphoric acid*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume. 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the two principal peaks is not less than 3.0.

Inject the test solution and reference solution (a). Run the chromatogram 25 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) and the sum of all the secondary peaks is not more than twice the area of the principal peak in

the chromatogram obtained with reference solution (a) (2.0 per cent).

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. Dilute a volume, accurately measured, containing about 0.15 mg of salbutamol with sufficient *water* to produce 80 ml, add 4 ml of a 5 per cent w/v solution of *sodium bicarbonate*, 4 ml of *N,N-dimethyl-4-phenylenediamine sulphate solution* and 4 ml of a freshly prepared 8 per cent w/v solution of *potassium ferricyanide*. Mix, allow to stand for 15 minutes, protected from light. Extract with two quantities, each of 10 ml, of *chloroform*. Filter the extracts through a plug of cotton wool and dilute to 25.0 ml with *chloroform*. Measure the absorbance of the resulting solution at 605 nm (2.4.7).

Calculate the content of $C_{13}H_{21}NO_3$ from the absorbance obtained by repeating the operation using 10.0 ml of a 0.0018 per cent w/v solution of *salbutamol sulphate*.

Storage. Store protected from light, in single dose containers in which the air has been displaced by nitrogen or other suitable inert gas.

Labelling. The label states the strength in terms of the equivalent amount of salbutamol in a suitable dose-volume.

Salbutamol Syrup

Albuterol Sulphate Syrup; Salbutamol Sulphate Syrup

Salbutamol Syrup contains Salbutamol Sulphate equivalent to not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of salbutamol, $C_{13}H_{21}NO_3$.

Usual strength. The equivalent of 2 mg of salbutamol in 5 ml. (1 mg of Salbutamol Sulphate is approximately equivalent to 830 µg of salbutamol).

Identification

A. To 5 ml add 50 ml of a 2 per cent w/v solution of *borax*, 1 ml of a 3 per cent w/v solution of *4-aminophenazone*, 10 ml of a 2 per cent w/v solution of *potassium ferricyanide* and 10 ml of *chloroform*. Shake and allow to separate; an orange-red colour is produced in the chloroform layer.

B. To 5 ml add sufficient *1 M sodium hydroxide* to make the solution alkaline, add 1 ml of *alkaline borate buffer pH 9.2* and 1 ml of a 0.04 per cent w/v solution of *2,6-dichloroquinone chlorimide* in *ethanol (95 per cent)*; a blue colour develops.

Tests

pH (2.4.24). 3.4 to 4.5.

Other tests. Complies with the tests stated under Oral Liquids.

Assay. To an accurately measured volume containing about 4 mg of salbutamol add 25 ml of *0.05 M sulphuric acid* and extract with two quantities, each of 50 ml, of *ether*. Collect the aqueous layers into a 250-ml volumetric flask and combine the ether extracts. Wash the combined ether extracts with 50 ml of *water* and add the aqueous layer to the solution in the 250 ml volumetric flask. Discard the ether extracts and dilute the aqueous solution with sufficient *water* to produce 250.0 ml. To 10.0 ml of this solution add sufficient *water* to produce 80 ml and add 4 ml of a 5 per cent w/v solution of *sodium bicarbonate*, 4 ml of *N,N-dimethyl-4-phenylenediamine sulphate solution* and 4 ml of a freshly prepared 8 per cent w/v solution of *potassium ferricyanide*. Mix, allow to stand for 15 minutes, protected from light. Extract with two quantities, each of 10 ml, of *chloroform*. Filter the extracts through a plug of cotton wool and dilute to 25.0 ml with *chloroform*. Measure the absorbance of the resulting solution at 605 nm (2.4.7).

Calculate the content of $C_{13}H_{21}NO_3$ from the absorbance obtained by repeating the operation using 10.0 ml of a 0.0018 per cent w/v solution of *salbutamol sulphate*.

Storage. Store protected from light.

Labelling. The label states the strength in terms of the equivalent amount of salbutamol in a suitable dose-volume.

Salbutamol Tablets

Albuterol Sulphate Tablets; Salbutamol Sulphate Tablets

Salbutamol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of salbutamol, $C_{13}H_{21}NO_3$.

Usual strengths. The equivalent of 2 mg; 4 mg of salbutamol. (1 mg of Salbutamol Sulphate is approximately equivalent to 830 µg of salbutamol).

Identification

A. Carry out the method described under Related substances applying separately to the plate 2 µl of each of the following solutions. For the test solution shake a quantity of the powdered tablets containing 10 mg of salbutamol with 10 ml of *methanol (80 per cent)* and filter. The reference solution contains 0.12 per cent w/v of *salbutamol sulphate RS*. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. Shake a quantity of the powdered tablets containing 8 mg of salbutamol with 50 ml of a 2 per cent w/v solution of *borax*, add 1 ml of a 3 per cent w/v solution of *4-aminophenazone*, 10 ml of a 2 per cent w/v solution of *potassium ferricyanide*

and 10 ml of *chloroform*. Shake and allow to separate; an orange-red colour is produced in the chloroform layer.

C. Shake a quantity of the powdered tablets containing 4 mg of salbutamol with 10 ml of *water* and filter; the filtrate gives the reactions of sulphates (2.3.1).

Tests

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 50 volumes of *ethyl acetate*, 30 volumes of *2-propanol*, 16 volumes of *water* and 4 volumes of *strong ammonia solution*.

Test solution. Shake a quantity of the powdered tablets containing 10 mg of salbutamol with 1 ml of *water* for 15 minutes, centrifuge and use the supernatant liquid.

Reference solution. A 0.006 per cent w/v solution of *salbutamol sulphate RS* in *water*.

Apply to the plate 20 µl of each solution. After development, dry the plate in air until the odour of the solvent is no longer detectable, place it for a few minutes in an atmosphere saturated with *diethylamine* and spray with *diazotised sulphanilic acid solution*. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution. Ignore any pink spot near the line of application.

Uniformity of content. Comply with the test stated under Tablets.

Determine by liquid chromatography (2.4.14).

Test solution. Add 50 ml of *water* to one tablet, shake for 1 hour, add sufficient *water* to produce 100.0 ml, mix and centrifuge. Dilute further with *water*, if necessary, to produce a solution containing 0.002 per cent w/v of salbutamol.

Reference solution (a). A 0.0024 per cent w/v of *salbutamol sulphate RS* in *water*.

Reference solution (b). A 0.048 per cent w/v of *2-tert-butylamino-1-(4-hydroxy-3-methylphenyl) ethanol sulphate RS* and 0.048 per cent w/v of *salbutamol sulphate RS* in *methanol (10 per cent)*.

Chromatographic system
- a stainless steel column 20 cm x 5 mm, packed with spherical particles of silica, 5 µm in diameter, the surface of which has been modified with chemically-bonded nitrile groups (such as Spherisorb CN),
- mobile phase: a mixture of 65 volumes of *water*, 30 volumes of *0.05 M ammonium acetate* and 5 volumes of *2-propanol*, the pH of the mixture being adjusted to 4.5 with *glacial acetic acid*,
- flow rate. 2 ml per minute,
- spectrophotometer set at 276 nm,
- injection volume. 20 µl.

The test is not valid unless resolution between two principal peaks in the chromatogram obtained with reference solution (b) is at least 1.5.

Calculate the content of $C_{13}H_{21}NO_3$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Shake 10 tablets or a sufficient number of tablets containing 5.0 mg of salbutamol with about 60 ml of *water* for 1 hour, add sufficient *water* to produce 250.0 ml, mix and centrifuge 10 ml of the mixture and use the supernatant liquid.

Reference solution (a). A 0.0024 per cent w/v of *salbutamol sulphate RS* in *water*..

Reference solution (b). A solution containing 0.0024 per cent w/v of *2-tert-butylamino-1-(4-hydroxy-3-methylphenyl) ethanol sulphate RS* and 0.0024 per cent w/v of *salbutamol sulphate RS in methanol (10 per cent)*.

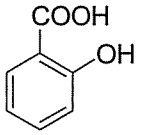
Follow the chromatographic procedure described under Uniformity of content. The test is not valid unless the resolution between the two principal peaks in the chromatogram obtained with reference solution (b) is at least 1.5.

Calculate the content of $C_{13}H_{21}NO_3$ in the tablets.

Storage. Store protected from light.

Labelling. The label states the strength in terms of the equivalent amount of salbutamol.

Salicylic Acid



$C_7H_6O_3$ Mol. Wt. 138.1

Salicylic Acid is 2-hydroxybenzoic acid.

Salicylic Acid contains not less than 99.0 per cent and not more than 100.5 per cent of $C_7H_6O_3$, calculated on the dried basis.

Category. Keratolytic.

Description. White or colourless, acicular crystals or a white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Test B may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *salicylic acid RS* or with the reference spectrum of salicylic acid.

B. Dissolve about 30 mg in 5 ml of *0.05 M sodium hydroxide*, neutralise if necessary and dilute to 20 ml with *water*. 1 ml of the solution gives reaction A of salicylates (2.3.1).

C. Melting point. 158° to 161° (2.4.21).

Tests

Appearance of solution. Dissolve 1.0 g in 10 ml of *ethanol (95 per cent)*. The resulting solution is clear, and colourless (2.4.1).

Heavy metals (2.3.13). Dissolve 2.0 g in 15 ml of *ethanol (95 per cent)* and add 5 ml of *water*. 12 ml of the resulting solution complies with the limit test for heavy metals, Method D (20 ppm). Use *lead standard solution (100 ppm Pb)* diluted with a mixture of 3 volumes of *ethanol (95 per cent)* and 1 volume of *water* to contain 2 µg of Pb per ml to prepare the standard.

Iron (2.3.14). Boil 12.0 g with 14 ml of *dilute ammonia solution* and 35 ml of *water*. Cool and adjust the pH 5.0 to 6.0 by the dropwise addition of *dilute ammonia solution* or *dilute sulphuric acid* and dilute to 50 ml with *water*, if necessary. Any pink colour produced is not more intense than that obtained by boiling 2.0 g with 1 ml of *iron standard solution (20 ppm Fe)*, 2 ml of *dilute ammonia solution* and 45 ml of *water*, adjusting the pH 5.0 to 6.0 and diluting to 50 ml with *water* (2 ppm).

Chlorides (2.3.12). Dissolve 5.0 g in 50 ml of boiling *distilled water*, cool and filter (solution A). 20 ml of solution A complies with the limit test for chlorides (125 ppm).

Sulphates (2.3.17). 7.5 ml of solution A complies with the limit test for sulphates (200 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent, determined on 2.0 g.

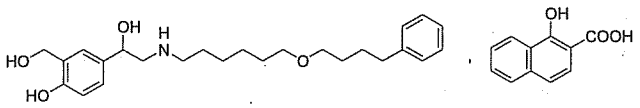
Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* in a desiccator.

Assay. Weigh accurately about 0.3 g, dissolve in 50 ml of *ethanol (95 per cent)*, add 20 ml of *water* and titrate with *0.1 M sodium hydroxide*, using *phenol red solution* as indicator, until a reddish violet colour is obtained.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01381 g of $C_7H_6O_3$.

Storage. Store protected from light.

Salmeterol Xinafoate



$C_{25}H_{37}NO_4, C_{11}H_8O_3$ Mol. Wt. 603.7

Salmeterol Xinafoate is (*RS*)-4-hydroxy-α^1-[[[6-(4-phenylbutoxy)hexyl]amino]methyl]-1,3-benzenedimethanol 1-hydroxy-2-naphthoate.

Salmeterol Xinafoate contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{36}H_{45}NO_7$, calculated on the anhydrous basis.

Category. Bronchodilator.

Description. A white to off-white powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *salmeterol xinafoate RS* or with the reference spectrum of salmeterol xinafoate.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 50 ml of the mobile phase.

Reference solution. A 0.002 per cent w/v solution of *salmeterol xinafoate RS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of *a* buffer solution prepared by dissolving 1.36 g of *potassium dihydrogen phosphate* in 1000 ml of *water* and adjusting the pH to 7.0 with *triethylamine* and 40 volumes of *acetonitrile*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume. 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the column efficiency in not less than 4500 theoretical plates.

Inject the test solution. Any individual impurity is not more than 0.5 per cent and the sum of all the impurities found is not more than 1.0 per cent.

Heavy metals (2.3.13). 1 g complies with limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 0.5 per cent, determined on 0.5 g.

Assay. Weigh accurately about 0.2 g and dissolve in 50 ml of *glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.06038 g of $C_{36}H_{45}NO_7$.

Storage. Store protected from light.

Salmeterol and Fluticasone Propionate Inhalation

Salmeterol and Fluticasone Propionate Inhalation is a suspension of microfine Salmeterol Xinafoate and Fluticasone Propionate in a suitable liquid filled in a suitable pressurised container. It may contain suitable pharmaceutical aids such as surfactants, stabilizing agents.

Salmeterol and Fluticasone Propionate Inhalation delivers not less than 80.0 per cent and not more than 120.0 per cent of the stated amounts of salmeterol, $C_{25}H_{37}NO_4$ and fluticasone propionate, $C_{25}H_{31}F_3O_5S$, per inhalation by actuation of the valve.

Identification

In the Assay, the principal peaks in the chromatogram obtained with test solution correspond to the peaks in the chromatogram obtained with reference solution (c).

Tests

Other tests. Comply with the tests stated under Inhalation Preparations (Pressurised Metered-dose Preparations).

Follow the procedure described under Assay with suitable dilution of the reference solution wherever the amount of active substance is to be determined in any test.

Assay. Carry out the test for Content of active ingredient delivered per actuation stated under Inhalation Preparations (Pressurised Metered-dose Preparations).

Determine by liquid chromatography (2.4.14).

Test solution. Prepare using the mobile phase as described under the test for Content of active ingredient delivered per actuation stated under Inhalation Preparations (Pressurised Metered-dose Preparations).

Reference solution (a). A solution containing 0.5 mg of salmeterol per ml prepared by dissolving 10 mg of *salmeterol xinafoate RS* in 10 ml *acetonitrile* and adding sufficient of the mobile phase to produce 20 ml.

Reference solution (b). A solution containing 0.5 mg of fluticasone propionate per ml prepared by dissolving 10 mg of *fluticasone propionate RS* in 10 ml *acetonitrile* and adding sufficient of the mobile phase to produce 20 ml.

Reference solution (c). Dilute suitable volumes of reference solution (a) and reference solution (b) with the mobile phase to obtain a solution containing 5 µg Salmeterol and 50 µg Fluticasone propionate per ml or quantities as per the label claim.

Chromatographic system

- a stainless steel column 15 cm × 3.9 mm, packed with octylsilyl silica gel (5 µm),
- column temperature 40°,
- mobile phase: a mixture of 45 volumes of a buffer solution prepared by dissolving 1.15 g *ammonium dihydrogen orthophosphate* to 1000 ml of *water* and adjusting the pH to 3.5 with *orthophosphoric acid*, 25 volumes of *acetonitrile* and 30 volumes of *methanol*,
- flow rate. 2 ml per minute,
- spectrophotometer set at 220 nm,
- inject 200 µl.

Inject reference solution (c). The test is not valid unless the column efficiency for salmeterol and fluticasone propionate peak is not less than 1000 and 2500 theoretical plates respectively and the tailing factor is not more than 2.0 for each peak and the relative standard deviation for replicate injections for each component is not more than 2.0 per cent.

Inject the test solution and reference solution (c).

Calculate the contents of $C_{25}H_{37}NO_4$ and $C_{25}H_{31}F_3O_5S$ in the solution and the contents of $C_{25}H_{37}NO_4$ and $C_{25}H_{31}F_3O_5S$ delivered per actuation of the valve.

Determine the contents of the active ingredients a second and third time by repeating the procedure on the middle ten and on the last ten successive combined actuations of the valve. For each of the three determinations the average contents of $C_{25}H_{37}NO_4$ and $C_{25}H_{31}F_3O_5S$ delivered per actuation of the valve meet the requirements.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Labelling. The label states the amounts of active ingredients delivered per inhalation.

Salmeterol and Fluticasone Propionate Powder for Inhalation

Salmeterol and Fluticasone Propionate Powder for Inhalation consists of Fluticasone Propionate and Salmeterol Xinafoate in microfine powder either alone or admixed with Lactose in a pre-metered unit for use in a suitable powder inhaler.

Salmeterol and Fluticasone Propionate Powder for Inhalation contains not less than 90.0 per cent and not more than 125.0 per cent of the stated amounts of salmeterol $C_{25}H_{37}NO_4$ and fluticasone propionate, $C_{25}H_{31}F_3O_5S$ per unit dose.

Identification

In the Assay, the principal peaks in the chromatogram obtained with the test solution correspond to the peaks in the chromatogram obtained with reference solution (c).

Tests

Other tests. Complies with the tests stated under the Inhalation Preparations (Powders for Inhalation).

Follow the procedure described under Assay with suitable dilution of the reference solution wherever the amount of active substance is to be determined in any test.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve a quantity of the mixed contents of 20 capsules in sufficient of the mobile phase to get a solution containing 5 µg per ml of Salmeterol.

Reference solution (a). A solution containing 0.5 mg of salmeterol per ml prepared by dissolving 10 mg of *salmeterol xinafoate RS* in 10 ml *acetonitrile* and adding sufficient of the mobile phase to produce 20 ml.

Reference solution (b). A solution containing 0.5 mg of fluticasone propionate per ml prepared by dissolving 10 mg of *fluticasone propionate RS* in 10 ml *acetonitrile* and adding sufficient of the mobile phase to produce 20 ml.

Reference solution (c). Dilute suitable volumes of reference solution (a) and reference solution (b) with the mobile phase to obtain a solution containing 5 µg Salmeterol and 50 µg Fluticasone propionate per ml or quantities as per the label claim..

Chromatographic system

- a stainless steel column 15 cm × 3.9 mm, packed with octylsilyl silica gel (5 µm),
- column temperature 40°,
- mobile phase: a mixture of 45 volumes of a buffer solution prepared by dissolving 1.15 g *ammonium dihydrogen orthophosphate* to 1000 ml of *water* and adjusting the pH to 3.5 with *orthophosphoric acid*, 25 volumes of acetonitrile and 30 volumes of *methanol*,
- flow rate. 2 ml per minute,
- spectrophotometer set at 220 nm,
- injection volume. 200 µl.

Inject reference solution(c). The test is not valid unless the column efficiency determined from the salmeterol and fluticasone propionate peak is not less than 1000 and 2500 theoretical plates respectively, the tailing factor for each of salmeterol and fluticasone propionate peaks is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

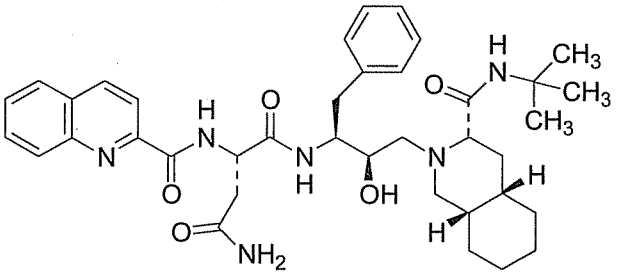
Inject the test solution and reference solution (c).

Calculate the contents of $C_{25}H_{37}NO_4$ and $C_{25}H_{31}F_3O_5S$ per unit.

Storage. Store protected from moisture, at temperature not exceeding 30°.

Labelling. The label states the quantities of active ingredients per pre-metered unit.

Saquinavir



$C_{38}H_{50}N_6O_5$ Mol. Wt. 670.8

Saquinavir is (*S*)-*N*-[(α*S*)-α-{(1*R*)-2-[(3*S*,4a*S*,8a*S*)-3-(*tert*-butylcarbamoyl)octahydro-2(1*H*)-isoquinolyl]-1-hydroxyethyl}phenethyl]-2-quinaldamidosuccinamide.

Saquinavir contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{38}H_{50}N_6O_5$, calculated on the anhydrous basis.

Category. Antiretroviral.

Dose. 1 g twice daily.

Description. A white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6), Compare the spectrum with that obtained with *saquinavir RS* or with the reference spectrum of saquinavir.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to saquinavir in the chromatogram obtained with reference solution (a).

C. When examined in the range 220 nm to 350 nm (2.4.7), a 0.002 per cent w/v solution in *methanol* shows absorption maxima at about 239 nm and 290 nm.

Tests

Specific optical rotation (2.4.22). –50.0° to –55.0°, determined in a 0.5 per cent w/v solution in *methanol*.

Related substances. Determine by liquid chromatography (2.4.14), as described in the Assay using the test solution and reference solution (c).

Inject reference solution (c). Calculate the amount of related substance by area normalisation method. In the chromatogram obtained with the test solution, the area of any peak other than the principal peak is not greater than the area of the principal peak obtained with reference solution (c) (0.1 per cent) and the sum of the areas of all such peaks is not greater than 5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit tests for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 2.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25.0 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). A 0.025 per cent w/v solution of *saquinavir RS* in the mobile phase.

Reference solution (b). Dissolve suitable quantities of *saquinavir-related compound A RS* and *saquinavir RS* in the mobile phase to obtain a solution containing 2 µg per ml of saquinavir-related compound A and 0.25 mg per ml of saquinavir.

Reference solution (c). A 0.000025 per cent w/v solution of *saquinavir RS* in the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 20 volumes of *methanol*, 50 volumes of *acetonitrile* and 30 volumes of a buffer prepared by dissolving 4 g of *sodium dihydrogen phosphate* in 1000.0 ml of *water* to which 1 ml of *diethylamine* and 1 g of *sodium octane sulphonate* has been added,
- flow rate. 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume. 20 µl.

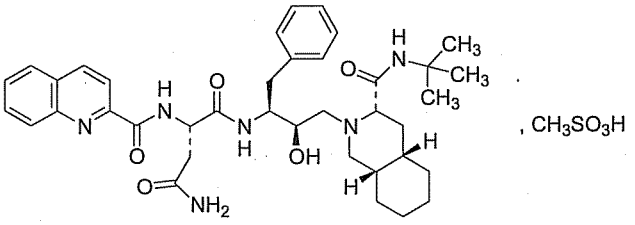
Inject reference solution (b). The relative retention times are about 0.89 for saquinavir-related compound A and about 1.0 for saquinavir. The test is not valid unless the resolution between the peaks due to saquinavir-related compound A and saquinavir is not less than 1.5, the column efficiency determined from the saquinavir peak is not less than 500 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Separately inject the test solution and reference solution (a). Record the chromatograms up to three times the retention time of the principal peak and measure the responses for the principal peak.

Calculate the content of $C_{38}H_{50}N_6O_5$.

Storage. Store protected from light.

Saquinavir Mesylate



$C_{38}H_{50}N_6O_5,CH_4O_3S$ Mol. Wt. 767.0

Saquinavir mesylate is (*S*)-*N*-[(α*S*)-α-{(1*R*)-2-[(3*S*,4a*S*,8a*S*)-3-(*tert*-butylcarbamoyl)octahydro-2(1*H*)-isoquinolyl]-1-hydroxyethyl}phenethyl]-2-quinaldamidosuccinamide methanesulphonate.

Saquinavir Mesylate contains not less than 98.5 per cent and not more than 101.0 per cent of $C_{38}H_{50}N_6O_5$, CH_4O_3S, calculated on the anhydrous basis.

Category. Antiretroviral.

Dose. 1 g twice daily.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6), Compare the spectrum with that obtained with *saquinavir mesylate RS* or with the reference spectrum of saquinavir mesylate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to saquinavir mesylate in the chromatogram obtained with reference solution (a).

Tests

Specific optical rotation (2.4.22). –66.8° to –69.6°, determined in a 0.5 per cent w/v solution in *methanol* at 436 nm.

Related substances. Determine by liquid chromatography (2.4.14), as described in the Assay using the test solution and reference solution (c).

Inject reference solution (c). Calculate the amount of related substances by area normalisation method. In the chromatogram obtained with the test solution, the area of any peak other than the principal peak is not greater than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent) and the sum of the areas of all such peaks is not greater than 5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Methanesulphonic acid. 11.9 to 13.1 per cent w/w, calculated on the anhydrous basis, determined by the following method. Weigh accurately about 0.1 g of the substance under examination, dissolve in 50 ml of *methanol*. Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.00961 g of CH_3SO_3H.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25.0 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). A 0.025 per cent w/v solution of *saquinavir mesylate RS* in the mobile phase.

Reference solution (b). Dissolve suitable quantities of *saquinavir-related compound A RS* and *saquinavir mesylate RS* in the mobile phase to obtain a solution containing 2 µg per ml of saquinavir- related compound A and 0.25 mg per ml of saquinavir mesylate.

Reference solution (c). A 0.000025 per cent w/v solution of *saquinavir mesylate RS* in the mobile phase.

NOTE — Store the buffer solution protected from light. Make adjustments if necessary for system suitability.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 25 volumes of *tetrahydrofuran*, 5 volumes of *acetonitrile* and 17 volumes of a buffer prepared by mixing 10 ml of *triethylamine* with *water* to make 1000 ml and adjusting the pH of the solution to 2.5 with *phosphoric acid*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume. 20 µl.

Inject reference solution (b). The relative retention times are about 0.89 for saquinavir-related compound A and about 1.0 for saquinavir mesylate. The test is not valid unless the resolution between the peaks due to saquinavir related compound A and saquinavir mesylate is not less than 1.5, the column efficiency determined from the saquinavir mesylate peak is not less than 500 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Separately inject the test solution and reference solution (a). Record the chromatograms upto three times the retention time of the principal peak and measure the responses for the principal peak.

Calculate the content of $C_{38}H_{50}N_6O_5$, CH_4O_3S.

Storage. Store protected from light.

Saquinavir Mesylate Tablets

Saquinavir Mesylate Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of saquinavir $C_{38}H_{50}N_6O_5$.

NOTE —Perform the tests and assay using low-actinic glassware.

Usual strength. 200 mg.

Identification

A. In the Assay, the principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

B. When examined in the range 200 nm to 400 nm (2.4.7), 1 ml of a 0.1 per cent w/v solution in *methanol* diluted to 100 ml with *citrate buffer pH 3.0* (see under Dissolution), shows absorption maxima at the same wavelengths as shown by the reference solution.

Tests

Dissolution (2.5.2).

Apparatus. No 1
Medium. 900 ml of *citrate buffer pH 3.0* prepared by dissolving 5.82 mg of *anhydrous dibasic sodium phosphate* and 16.7 mg of *citiric acid monohydrate* in 1000 ml of *water* and adjusting the pH to 3.0 with *orthophosphoric acid*.

Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter promptly. Dilute the filtrate, if necessary, with the medium. Measure the absorbance (2.4.7) of the resulting solution at the maximum at about 240 nm. Calculate the content of $C_{38}H_{50}N_6O_5$ in the medium from the absorbance obtained from a solution of known concentration of *saquinavir mesylate RS*.

D. Not less than 75 per cent of the stated amount of $C_{38}H_{50}N_6O_5$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets Weigh accurately a quantity of the powder containing 100 mg of saquinavir in 100 ml of the mobile phase and filter.

Reference solution (a). A 0.1 per cent w/v solution of *saquinavir mesylate RS* in the mobile phase.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 14 volumes of *triethylamine phosphate solution* prepared by diluting 10 ml of *triethylamine* to 1000 ml with *water* and adjusting the pH to 2.5 with *orthophosphoric acid*, 5 volumes of tetrahydrofuran and 1 volume of *acetonitrile*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume. 20 µl.

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 3000 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution and reference solution (b). Run the chromatogram for 5 times the retention time (about 12 minutes) of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.2 times the area of the peak in the chromatogram obtained with the reference solution (b) (0.2 per cent) and the sum of areas of all the secondary peaks is not more than the area of the peak in the chromatogram obtained with the reference solution (b) (1.0 per cent).

Uniformity of content. Comply with the test stated under Tablets.

Determine by liquid chromatography (2.4.14), as described under Assay.

Test solution. Disperse one tablet in 500 ml of the mobile phase and filter. Dilute 5 ml of the filtrate to 20 ml with the mobile phase.

Calculate the content of $C_{38}H_{50}N_6O_5$ in the tablet.

Other tests. Comply with the tests stated under Tablets.

Water (2.3.43). Not more than 6.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing 100 mg of saquinavir, dissolve in 100.0 ml of mobile phase and filter. Dilute 5.0 ml of the filtrate to 20.0 ml with the mobile phase.

Reference solution. A 0.1 per cent w/v solution of *saquinavir mesylate RS* in the mobile phase. Dilute 5.0 ml of the solution to 20.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 14 volumes of a solution prepared by diluting 10.0 ml of *triethylamine* to 1000 ml with *water*, adjusting the pH to 2.5 with *orthophosphoric acid* and filtering, 5 volumes of *tetrahydrofuran* and 1 volume of *acetonitrile*.
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency in not less than 2000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

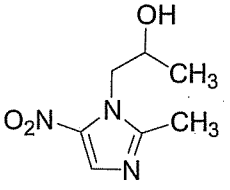
Inject the test solution and the reference solution.

Calculate the content of $C_{38}H_{50}N_6O_5$ in the tablets.

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the equivalent amount of saquinavir.

Secnidazole



$C_7H_{11}N_3O_3$ Mol. Wt. 185.2

Secnidazole is (*RS*)-1-(2-methyl-5-nitroimidazol-1-yl)propan-2-ol.

Secnidazole contains not less than 98.0 per cent and not more than 101.0 per cent of $C_7H_{11}N_3O_3$, calculated on the anhydrous basis.

Category. Antiamoebic.

Dose. Adults - 2g; Children - 30 mg per kg as single dose.

Description. A white to yellowish white, crystalline powder.

Identification

A. When examined in the range 230 nm to 360 nm (2.4.7), a 0.001 per cent w/v solution in *0.1 M hydrochloric acid* shows an absorption maximum at about 277 nm, 0.325 to 0.355.

B. Heat about 10 mg in a water-bath with 10 mg of *zinc powder*, 1 ml of *water* and 0.25 ml of *2 M hydrochloric acid* for 5 minutes and cool. The solution gives the reaction of primary aromatic amines (2.3.1).

Tests

Appearance of solution. A 5 per cent w/v solution in *1 M hydrochloric acid* is not more opalescent than opalescence standard OS2 (2.4.1) and not more intensely coloured than reference solution GYS4 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the same solvent.

Reference solution (b). A solution containing 0.005 per cent w/v each of *2-methyl-5-nitroimidazole RS* and *secnidazole RS* in the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the same solvent.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of *methanol* and 65 volumes of 0.14 per cent w/v solution of *potassium dihydrogen phosphate,*
- flow rate. 1 ml per minute,
- spectrophotometer set at 318 nm,
- injection volume. 10 µl.

Inject reference solution (b). The test is not valid unless the resolution between 2-methyl-4-nitroimidazole and secnidazole is not less than 1.5.

Inject the test solution and reference solution (a). In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 2 times the area of the peak in the chromatogram obtained with reference solution (a) (0.2 per cent) and the sum of areas of all the secondary peaks is not more than 5 times the area of the peak in the chromatogram obtained with the reference solution (a) (0.5 per cent). Disregard any peak which is 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.01 per cent).

Heavy metals (2.3.13).1.0 g complies with the limit test for heavy metals, Method A (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 4.0 to 5.0 per cent, determined on 0.4 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 25.0 ml of the mobile phase. Dilute 5.0 ml of the solution to 100.0 ml with the same solvent.

Reference solution. A 0.005 per cent w/v solution of *secnidazole RS* in mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of *methanol* and 65 volumes of 0.14 per cent w/v solution of *potassium dihydrogen phosphate,*
- flow rate. 1 ml per minute,
- spectrophotometer set at 318 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_7H_{11}N_3O_3$.

Storage. Store protected from light and moisture.

Secnidazole Tablets

Secnidazole Tablets contain not less than 95.0 per cent and not more than 110.0 per cent of the stated amount of secnidazole, $C_7H_{11}N_3O_3$.

Usual strengths. 1 g; 2 g.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus. No. 1,

Medium. 900 ml of *0.1 M hydrochloric acid.*
Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter promptly through a membrane filter disc having an average pore diameter not greater than 1.0 µm, rejecting the first 1 ml of the filtrate. Dilute the filtrate, if necessary, with the same solvent. Measure the absorbance of the resulting solution at the maximum at about 277 nm (2.4.7). Calculate the content of $C_7H_{11}N_3O_3$ in the medium from the absorbance obtained from a solution of known concentration of *secnidazole RS* in the same medium.

D. Not less than 80 per cent of the stated amount of $C_7H_{11}N_3O_3$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh accurately a quantity of powdered tablets containing 50 mg of Secnidazole, disperse in 100 ml of mobile phase and filter.

Reference solution (a). A 0.05 per cent w/v solution of *secnidazole RS* in the mobile phase.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with mobile phase.

Chromatographic system as described under Assay.

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 2.0 and the column efficiency in not less than 2000 theoretical plates.

Inject the test solution and reference solution (b). In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 2.0 times the area of the peak in the chromatogram obtained with the reference solution (b) (2.0 per cent).

Water (2.3.43). Not more than 6.5 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh accurately a quantity of powdered tablet containing 50 mg of Secnidazole, disperse in 100.0 ml of mobile phase and filter.. Dilute 5.0 ml of the filtrate to 50.0 ml with mobile phase.

Reference solution. A 0.005 per cent w/v solution of *secnidazole RS* in mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane chemically bonded to porous silica (5 µm),
- mobile phase: a mixture of 85 volumes of *0.01 M potassium dihydrogen orthophosphate* and 15 volumes of *acetonitrile,*
- flow rate. 1 ml per minute,
- spectrophotometer set at 228 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation of replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_7H_{11}N_3O_3$.

Storage. Store protected from light and moisture.

Labelling. The label states the strength of secnidazole.

Serratiopeptidase

Serratiopeptidase is a proteolytic enzyme for oral use which is produced by bacteria of genus Serratia.

Serratiopeptidase contains not less than 2000 units and not more than 2600 units of serratiopeptidase activity per mg.

Category. Prolytic enzyme.

Description. A grayish white to pale brown powder with characteristic odour.

Identification

Dissolve 0.4 g of serratiopeptidase in 100 ml of *acetic acid sodium acetate buffer solution pH 5.0*, transfer exactly 1 ml of this solution into 3 test tubes, refer them as A, B and C. Add 1 ml of *water* in tube A. In tube B and C add 1 ml of 0.04 ml of *disodium edetate solution.* Mix gently and allow them to stand at 4±1°, for 1 hour. Add 2 ml of *water* in tube A and C. Add 2 ml of *0.04 M zinc chloride* solution in tube B. Mix gently and allow them to stand at 4±1°, for 1 hour. Pipette 1 ml of A and B and make up the volume to 200 ml with *borate buffer pH 9.0.* Pipette 1 ml of C and make up the volume to 50 ml with *borate buffer pH 9.0.* Proceed with these solutions as sample solutions as directed in the assay. The activities of solution A and B are almost same and the activity of C is not more than 5 per cent of that of activity of A.

Tests

Arsenic (2.3.10). Dissolve 0.4 g in 50 ml of *water*, and add 10 ml of *stannated hydrochloric acid.* The resulting solution complies with the limit test for arsenic (5 ppm).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (50 ppm).

Sulphated Ash (2.3.18). Not more than 1.5 per cent.

Loss on drying (2.4.19). Not more than 7.0 per cent, determined on 1 g by drying in an oven at 105° for 4 hours.

Microbial contamination (2.2.9). Total viable aerobic count, not more than 100 micro-organisms per ml, determined by plate count. 1 ml is free from *Escherichia coli.*

Assay. Unit definition: one serratiopeptidase unit is defined as the amount of enzyme required to liberate 1 µm of free tyrosine per minute under the specified assay conditions.

sodium borate hydrochloric acid buffer pH 9.0. Dissolve 19 g *sodium borate* in 900 ml of *water.* Adjust the pH 9.0 with *1 M hydrochloric acid* and dilute with *water* to 1000 ml.

Substrate solution. Dissolve 1.2 g dried casein in 100 ml of *sodium borate hydrochloric acid buffer pH 9.0.* Keep it on boiling water-bath for 1-2 minutes to get clear solution. Cool and filter through cotton and dilute with *sodium borate hydrochloric acid buffer pH 9.0* to 200 ml.

Protein precipitating solution. To 18 g of *trichloroacetic acid,* add 30 g of *sodium acetate* and 20 ml of *glacial acetic acid,* and dilute with *water* to 100 ml.

Dilute folin's reagent. 1 ml of *folin's reagent,* add 2 ml of *water.*

Reference tyrosine solution. Dissolve 10 mg of *tyrosine* in 1 ml of *1 M hydrochloric acid* and dilute to 100 ml with *sodium borate hydrochloric acid buffer pH 9.0.*

Reference tyrosine curve. To 1, 2, 3, 4 and 5 ml of *reference tyrosine solution,* add 5, 4, 3, 2 and 1 ml of *sodium borate hydrochloric acid buffer pH 9.0* respectively. Add 5 ml of *protein precipitating reagent* in each tube. To 2 ml of these solutions, add 5 ml of *sodium carbonate solution.* Add 1 ml of diluted *folin's reagent* mix and allow to stand at 37° for 30 minutes, measure the absorbance at 660 nm (2.4.7). Plot a graph of µm of tyrosine per system against the absorbance.

Stock test solution. Weigh about 0.1 g of the substance under examination, dissolve in 100 ml of *sodium borate hydrochloric acid buffer pH 9.0* (solution A). Mix and keep it for 5 minutes. Take 1 ml of solution A and dilute to 200 ml with *sodium borate hydrochloric acid buffer pH 9.0* (solution B).

Test solution. Pipet 1.0 ml of *stock test solution,* allow to stand in a water-bath at 37° for 5 minutes. Add 5 ml of substrate solution shake immediately and allow to stand in water-bath at 37° for 20 minutes. Add 5 ml of *protein precipitating solution.* Mix and allow to stand in water-bath at 37° for 30 minutes and filter. Take 2 ml of the filtrate, add 5 ml of 0.6 per cent w/v *sodium carbonate solution.* Add 1 ml of *diluted folin's reagent* mix and allow to stand at 37° for 30 minutes. Measure the absorbance at 660 nm (2.4.7).

Blank solution. Pipet 1.0 ml of *stock test solution,* allow to stand in a water-bath at 37° for 5 minutes, add 5 ml of *protein precipitating solution,* shake immediately and allow to stand in water-bath at 37° for 20 minutes. Add 5 ml of substrate solution. Mix and allow to stand in water-bath at 37° for 30 minutes and filter. Take 2 ml of the filtrate, add 50 ml of 0.6 per cent w/v *sodium carbonate solution.* Add 1 ml of *diluted folin's reagent* mix and allow stand at 37° for 30 minutes. Measure the absorbance at 660 nm (2.4.7).

Calculate the serratiopeptidase IU/mg by using concentration of tyrosine from graph considering the reaction time and dilution.

Storage. Store protected from light and moisture, at temperature not exceeding 30°.

Serratiopeptidase Tablets

Serratiopeptidase Tablets contain not less than 90.0 per cent of the stated amount of Serratiopeptidase.

Usual strengths. 5 mg; 10 mg.

Tests

Other tests. Comply with the tests stated under Tablets.

Assay. The tyrosine units are dissolved in *sodium carbonate solution,* which is alkaline in nature. The *Folin's ciocalteau reagent* helps in colour development where the tyrosine units bind to the copper molecule in the reagent and causes the reduction of phosphomolybdate which is present in the reagent. There is formation of tyrosine-copper molybdate coloured complex. The intensity of colour depends upon the tyrosine units present which is read at 660 nm.

Disodium tetraborate buffer. Dissolve 19.0 gm of *disodium tetraborate* in 900 ml of *water,* adjusted to pH 9.0 with *1 M hydrochloric acid* and dilute to 1000 ml with *water.*

Casein hammerstein substrate. Dissolve 1.2 gm of *Casein Hammerstein* to 100 ml of the sodium tetraborate buffer. Allow the casein to dissolve and form homogeneous solution. Boil the solution in boiling water-bath for 2 minutes. After removing from boiling water-bath, cool the casein substrate immediately in ice cold water. Filter this solution through cotton plug to get clear solution and dilute to 200 ml with *water.*

NOTE—Always add casein to the buffer while stirring. Do not add buffer to casein as this will cause lumps and not go into solution completely and giving incorrect values.

Trichloroacetic acid reagent. Dissolve 18 gm of *trichloroacetic Acid,* 30 gm of *anhydrous sodium acetate* and 20 ml of *glacial acetic acid* in 1000 ml of *water.*

NOTE—TCA should be in the crystal form and not in liquid form as this will effect the quantity weighed and thereby interfere with the complete precipitation of casein. Use Sodium acetate anhydrous because if, sodium acetate trihydrate should be used, the trihydrate forms gives lower results.

Diluted Folin's Ciocalteau Reagent. Dilute 1 ml of Folin's Ciocalteau reagent with 2 ml of *water* to get 3 ml of the reagent.

NOTE—Folin's Ciocalteau reagent should be of the protein estimation grade and not the indicator grade. Folin's reagent should be diluted to just before addition to the tubes since it is sensitive to light. Do not prepare this solution at the beginning of the assay.

Tyrosine reference solution. Dissolve 160 mg of *tyrosine* in 100 ml of *0.2 M hydrochloric acid.*

Dilute 1 ml of this solution to 100 ml with *0.2 M hydrochloric acid.* Use 2 ml of this solution for colour development.

Trisodium phosphate buffer pH 6.8. Weigh 19 g of *trisodium phosphate* and 6.4 ml of *hydrochloric acid* in 1000 ml of *water*, adjusted to pH 6.8.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing about 120 mg of Serratiopeptidase with 100 ml of *trisodium phosphate buffer pH 6.8.* Stir on magnetic stirrer for 1 hour. Further dilute 5.0 ml to 25 ml with *5.0 per cent ammonium sulphate solution,* stir for 5 minutes and filter. Dilute 2 ml of the filtrate to 100 ml with *sodium tetraborate buffer.* 1 ml of resulting solution is used for analysis. Set the water bath to 37°.

For each sample, keep four test tubes. Mark two test tubes as TEST and two as BLANK. Add 5 ml of Casein Substrate to the tubes marked as TEST and 5 ml. of TCA to the test tube marked as BLANK. Prewarm these tubes for five minutes along with the tubes containing the sample dilutions. Add 1 ml of enzyme solution to all these tubes and vertex the tubes for exactly 10 seconds. Keep the test tubes in the water-bath at 37° for 20 minutes for the reaction. After exactly 20 minutes, add 5 ml of TCA to tubes marked as TEST and 5 ml of Casein substrate to the tube marked as BLANK. Vertex all the tubes exactly for 30 seconds. Keep the tubes in the water-bath at 37° for 30 minutes for precipitation, filter.

NOTE— For tablets, the settlement may take a longer time than 30 minutes. So filter the solution after the settlement is clearly seen (Vertex in between for better precipitation).

Mark tubes as TEST, BLANK, TYROSINE and TYROSINE BLANK.

Add the following respectively;

TEST – 2 ml of the TEST filtrate.

BLANK – 2 ml of BLANK filtrate.

TYROSINE – 2 ml of TYROSINE standard solution.

TYROSINE BLANK – 0.2 M hydrochloric acid.

Add 5 ml of 6 per cent sodium carbonate solution to all tubes.

Add 1 ml of diluted Folin's reagent to all the tubes. Keep the tubes at 37° for 30 minutes for colour development. Measure the absorbance at about 660 nm (2.4.7).

$$\text{Serratiopeptidase Units/Tablets} = \frac{A_1 - A_2}{A_3 - A_4} \times 176 \times \frac{1}{20} \times \frac{100}{\text{Spl.Wt.(g)}} \times \frac{25}{5} \times \frac{100}{2} \times \text{Avg.wt.in gm}$$

$$\% \text{ of L.A.} = \frac{\text{Serratiopeptidase Units/Tablet}}{\text{L.A.}} \times 100$$

Where, 176 = Conversion Co-efficient of Tyrosine to Serratiopeptidase
20 = Reaction time [minutes]
A_1 = Absorbance of test solution
A_2 = Absorbance of blank solution
A_3 = Absorbance of tyrosine reference solution.
A_4 = Absorbance of 0.2M hydrochloric acid
L.A. = 20000 Units/tablet.

Storage. Store protected from moisture, at a temperature not exceeding 25°.

Labeling. The label states the strength in terms of the equivalent to Enzyme activity units of Serratiopeptidase.

Colloidal Silicon Dioxide

Colloidal Anhydrous Silica

SiO_2 Mol. Wt. 60.1

Colloidal Silicon Dioxide is a submicroscopic fumed silica prepared by the vapour-phase hydrolysis of a silicon compound.

Colloidal Silicon Dioxide contains not less than 99.0 per cent and not more than 100.5 per cent of SiO_2, calculated on the ignite basis.

Category. Pharmaceutical aid (tablet excipient).

Description. A light, fine, white, amorphous powder. It has a particle size of about 15 nm.

Identification

About 20 mg gives the reaction of silicates (2.3.1).

Tests

pH (2.4.24). 3.5 to 5.5, determined in a suspension of 1.0 g in 30 ml of *carbon dioxide-free water.*

Arsenic (2.3.10). To 2.5 g contained in a round-bottomed flask add 50 ml of *3 M hydrochloric acid* and heat under a reflux condenser for 30 minutes. Cool, filter with the aid of suction and transfer the filtrate to a 100-ml volumetric flask. Wash the filter with several portions of hot water and add the washings to the volumetric flask. Cool, dilute to volume with *water* and

mix. To 50.0 ml of the solution add 3 ml of *hydrochloric acid;* the resulting solution complies with the limit test for arsenic (8 ppm).

Heavy metals (2.3.13). Suspend 2.5 g in sufficient *water* to produce a semi-fluid slurry and dry at 140°. When the dried substance is white, break up the mass using a glass rod, add 25 ml of *1 M hydrochloric acid*, boil gently for 5 minutes, stirring frequently with the glass rod, centrifuge for 20 minutes and filter the supernatant liquid through a membrane filter. To the residue in the centrifuge tube add 3 ml of *2 M hydrochloric acid* and 9 ml of *water*, boil, centrifuge for 20 minutes and filter the supernatant liquid through the same membrane filter. Wash the residue with small quantities of *water*, combine the filtrates and washings and dilute to 50.0 ml with *water*. To 20.0 ml of the solution add 50 mg of *L-ascorbic acid* and 1 ml of *strong ammonia solution*, neutralise with *2 M ammonia* and dilute to 25 ml with *water*. 12 ml of the solution complies with the limit test for heavy metals, Method D (25 ppm). Use *lead standard solution (1 ppm Pb)* to prepare the standard.

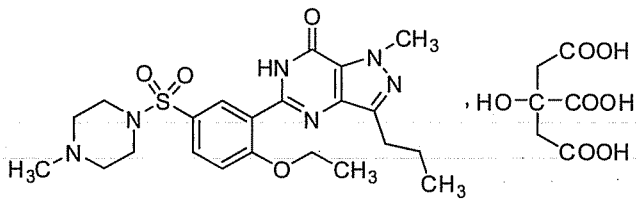
Chlorides (2.3.12). To 1.0 g add a mixture of 20 ml of *2 M nitric acid* and 30 ml of *water*, heat on a water-bath for 15 minutes, shaking frequently, dilute to 50 ml with *water* if necessary, filter and cool. The filtrate complies with the limit test for chlorides (250 ppm).

Loss on ignition (2.4.20). Not more than 5.0 per cent, determined on 0.2 g by igniting at 900° in a platinum crucible for 2 hours.

Assay. To the residue obtained in the test for Loss on ignition add 0.2 ml of *sulphuric acid* and sufficient *ethanol (95 per cent)* to moisten the residue completely, add 6 ml of *hydrofluoric acid* and evaporate to dryness on a hot plate at 95° to 105°, avoiding loss from sputtering. Wash the sides of the dish with 6 ml of *hydrofluoric acid*, evaporate to dryness in a well-ventilated hood, ignite at 1000°, allow to cool in a desiccator and weigh. The difference between the weight of the final residue and that of the residue obtained in the test for Loss on ignition represents the amount of SiO_2 in the amount of the substance taken for the test for Loss on ignition.

Storage. Store protected from light.

Sildenafil Citrate



$C_{28}H_{38}N_6O_{11}S$ Mol. Wt. 666.7

Sildenafil Citrate is 5-[2-ethoxy-5-(4-methylpiperazinylsulphonyl)phenyl]-1-methyl-3-*n*-propyl-1,6-dihydro-7*H*-pyrazolo[4,3-*d*]pyrimidin-7-one citrate.

Sildenafil Citrate contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{28}H_{38}N_6O_{11}S$, calculated on the dried basis.

Category. Used in erectyle dysfunction.

Description. A white to off white powder.

Dose. 50 mg per day.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum that obtained with *sildenafil citrate RS* or with the reference spectrum of sildenafil citrate.

B. Complies with the test for Citrate (2.3.1).

Tests

Citric acid. 28.0 per cent to 34.0 per cent.

Accurately weigh about 0.2 g of the substance under examination and transfer into a 250-ml conical flask, add 50 ml of *methanol* and sonicate to dissolve, then add 50 ml of *water*. Titrate with *0.1 M sodium hydroxide solution* using *phenolphthalein* indicator until the colour changes from colourless to pink.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.006403 g of $C_6H_8O_7$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Use freshly prepared solution.

Solvent mixture. 30 volumes of *water* and 70 volumes of *acetonitrile*.

Test solution. Dissolve 50 mg of the substance under examination in 100.0 ml of the solvent mixture.

Reference solution (a). A 0.05 per cent w/v solution of *sildenafil citrate RS* in the solvent mixture.

Reference solution (b). Dilute 10.0 ml of reference solution (a) to 100.0 ml with the solvent mixture. Further dilute 3.0 ml of this solution to 100.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (such as Hypersil ODS C18),
- mobile phase: A. dissolve 3.85 g of *ammonium acetate* in 1000 ml of *water*, adjusted to pH 7.5 with *ammonia solution*,

  B. *acetonitrile*,
- a linear gradient programme using the conditions given below,
- flow rate. 1 ml per minute,

- spectrophotometer set at 240 nm,
- injection volume. 20 µl.

Time (in min.)	Mobile phase A (per cen v/v)	Mobile phase B (per cent v/v)
0	65	35
15	65	35
30	20	80
40	20	80
45	65	35
50	65	35

Inject reference solution (b). The test is not valid unless the relative standard deviation for replicate injections is not more than 5.0 per cent. The relative retention time with reference to sildenafil for N-oxide is about 0.29 and for chlorosulphonyl is about 1.6.

Inject the test solution and reference solution (b). In the chromatogram obtained with test solution the area of the peak due to N-oxide impurity is not more than 1.67 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent), the area of peak due to chlorosulphonyl is not more than 0.67 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent). The sum of areas of all the secondary peaks is not more than 3.3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak corresponding to citric acid.

Heavy Metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

NOTE—Use freshly prepared solution.

Solvent mixture. 30 volumes of *water* and 70 volumes of *acetonitrile*.

Test solution. Dissolve 50 mg of the substance under examination in 50.0 ml of the solvent mixture. Dilute 5.0 ml of this solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.1 per cent w/v solution of *sildenafil citrate RS* in the solvent mixture. Dilute 5.0 ml of this solution to 50.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (such as Hypersil ODS C18),
- mobile phase: a mixture of 50 volumes of a buffer solution prepared by dissolving 3.85 g of *ammonium acetate* in 1000 ml of *water*, adjusted to pH 7.5 with *ammonia solution* and 50 volumes of *acetonitrile,*
- flow rate. 1 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the theoretical plates is not less than 2000, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{28}H_{38}N_6O_{11}S$.

Storage. Store protected from light and moisture.

Sildenafil Tablets

Sildenafil Citrate Tablets

Sildenafil Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of sildenafil citrate, $C_{28}H_{38}N_6O_{11}S$.

Usual Strengths . 25 mg; 50 mg; 100 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1,

Medium. 900 ml of *0.01 M Hydrochloric acid,*

Speed and time. 100 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the medium if necessary, at the maximum at about 294 nm (2.4.7). Calculate the content of $C_{28}H_{38}N_6O_{11}S$ in the medium from the absorbance obtained from a solution of known concentration of *sildenafil citrate RS* in the same medium.

D. Not less than 70 per cent of the stated amount of $C_{28}H_{38}N_6O_{11}S$.

Related substances. Determine by liquid chromatography (2.4.14)

Solvent mixture. 50 volumes of mobile phase A and 50 volumes of *methanol.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing about 50 mg of sildenafil with 35 ml of

the solvent mixture, sonicate for 20 minutes and dilute to 50 ml with the solvent mixture, filter.

Reference solution (a). A 0.028 per cent w/v solution of *sildenafil citrate RS* in the solvent mixture.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 100 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane chemically bonded to porous silica (5 µm) (Such as Zorbax Eclipse XDB C18),
- column temperature. 40°,
- mobile phase: A. a solution containing 3.85 g of *ammonium acetate* and 1.0 ml of *triethylamine* in 1000 of *water*, adjusted to pH 5.5 with *acetic acid*,
  B. *methanol*,
- a linear gradient programme using the conditions given below,
- flow rate. 1 ml per minute,
- spectrophotometer set at 294 nm,
- injection volume.10 µl.

Time (in min.)	Mobile Phase A (per cent /v/v)	Mobile Phase B (per cent /v/v)
0	47	53
20	47	53
35	10	90
45	10	90
50	47	53
60	47	53

Inject reference solution (b). The test is not valid unless the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject reference solution (b) and the test solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 0.8 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.8 per cent), the area of peak corresponding to N-oxide impurity at relative retention time 0.54 is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 2.0 times the area of the peak in the chromatogram obtained with reference solution (b) (2.0 per cent). Ignore the peak due to citric acid at retention time about 2.4 minutes.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 50 volumes of mobile phase and 50 volumes of *methanol*.

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing about 50 mg of sildenafil with 35 ml of the solvent mixture, sonicate for 20 minutes and dilute to 50.0 ml with the solvent mixture, filter.

Reference solution. A 0.14 per cent w/v solution of *sildenafil citrate RS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with silica (5 µm) (Such as Zorbax Eclipse XDB C18),
- mobile phase: a mixture of 30 volumes of solution containing 3.85 g of *ammonium acetate* and 1.0 ml of *triethylamine* in 1000 ml of *water*, adjusted to pH 5.5 with *acetic acid* and 70 volumes of *methanol*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 294 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the theoretical plates is not less than 2000, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the reference solution the test solution.

Calculate the content of $C_{28}H_{38}N_6O_{11}S$ in the tablet.

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the equivalent amount of sildenafil.

Silver Nitrate

$AgNO_3$ Mol. Wt. 169.9

Silver Nitrate contains not less than 99.0 per cent and not more than 100.5 per cent of $AgNO_3$.

Category. Local anti-infective.

Description. Colourless crystals or a white, crystalline powder.

Identification

A. Gives the reactions of silver salts (2.3.1).

B. 10 mg gives reaction A of nitrates (2.3.1).

Tests

Appearance of solution. A 4.0 per cent w/v solution (solution A) is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. To 2 ml of solution A add 0.1 ml of *bromocresol green solution*; the solution is blue. To 2 ml of this solution add 0.1 ml of *phenol red solution*; the solution is yellow.

Aluminium, bismuth, copper and lead. Dissolve 1.0 g in a mixture of 4 ml of *strong ammonia solution* and 6 ml of *water*; the resulting solution is clear (2.4.1), and colourless (2.4.1).

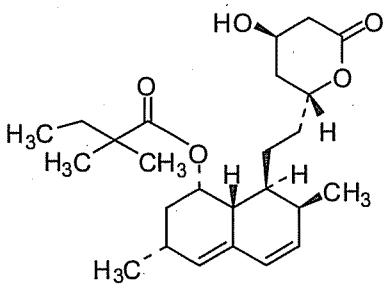
Foreign salts. Not more than 0.3 per cent, determined by the following method. To 30 ml of solution A add 7.5 ml of *2 M hydrochloric acid*, shake vigorously, heat for 5 minutes on a water-bath, filter and evaporate 20 ml of the filtrate to dryness on a water-bath. Dry the residue at 105° and weigh.

Assay. Weigh accurately about 0.3 g, dissolve in 50 ml of *water*, add 2 ml of *2 M nitric acid* and 2 ml of *ferric ammonium sulphate solution* and titrate with *0.1 M ammonium thiocyanate* until a reddish yellow colour is produced.

1 ml of *0.1 M ammonium thiocyanate* is equivalent to 0.01699 g of $AgNO_3$.

Storage. Store protected from light and moisture, in non-metallic containers.

Simvastatin



$C_{25}H_{38}O_5$ Mol.Wt. 418.6

Simvastatin is (1*S*,3*R*,7*S*,8*S*,8a*R*)-8-[2-[(2*R*,4*R*)-4-hydroxy-6-oxotetrahydro-2*H*-pyran-2-yl]ethyl]-3,7-dimethyl-1,2,3,7,8,8a-hexahydronapthalen-1-yl 2,2-dimethylbutyrate.

Simvastatin contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{25}H_{38}O_5$, calculated on the dried basis. A suitable antioxidant may be added.

Category. Antihyperlipidaemic.

Dose. 5 mg to 10 mg per day.

Description. A white or almost white, crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *simvastatin RS* or with the reference spectrum of simvastatin.

Tests

Appearance of solution. A 1.0 per cent w/v solution in *methanol* is clear (2.4.1) and not more intensely coloured than reference solution BYS6 (2.4.1).

Specific optical rotation (2.4.22). +285° to +300°, determined in a 0.5 per cent w/v solution in *acetonitrile*.

Related substances. Determine by liquid chromatography (2.4.14), as described under the Assay.

Inject test solution (a). Run the chromatogram 5 times the retention time of the principal peak. The relative retention time with reference to simvastatin for (3*R*,5*R*)-7-[(1*S*,2*S*,6*R*,8*S*,8a*R*)-8-[(2,2-dimethylbutanoyl)oxy]-2,6-dimethyl-1,2,6,7,8,8a-hexahydronaphthalen-1-yl]-3,5-dihydroxyheptanoic acid (hydroxy acid) (simvastatin impurity A) is about 0.45, for lovastatin (simvastatin impurity E) and epilovastatin (simvastatin impurity F) is about 0.6, for (1*S*,7*S*,8*S*,8a*R*)-8-[2-[(2*R*,4*R*)-4-hydroxy-6-oxotetrahydro-2*H*-pyran-2-yl]ethyl]-7-methyl-3-methylene-1,2,3,7,8,8a-hexahydronaphthalen-1-yl 2,2-dimethylbutanoate) (simvastatin impurity G) is about 0.8, for (1*S*,3*R*,7*S*,8*S*,8a*R*)-8-[2-[(2*R*,4*R*)-4-(acetyloxy)-6-oxotetrahydro-2*H*-pyran-2-yl]ethyl]-3,7-dimethyl-1,2,3,7,8,8a-hexahydronaphthalen-1-yl 2,2-dimethylbutanoate (acetate ester) (simvastatin impurity B) is about 2.38, for (1*S*,3*R*,7*S*,8*S*,8a*R*)-3,7-dimethyl-8-[2-[(2*R*)-6-oxo-3,6-dihydro-2*H*-pyran-2-yl]ethyl]-1,2,3,7,8,8a-hexahydronaphthalen-1-yl 2,2-dimethylbutanoate (anhydrosimvastatin) (simvastatin impurity C) is about 2.42 and for (2*R*,4*R*)-2-[[(1*S*,2*S*,6*R*,8*S*,8a*R*)-8-[(2,2-dimethylbutanoyl)oxy]-2,6-dimethyl-1,2, 6,7,8,8a-hexahydronaphthalen-1-yl]ethyl]-6-oxotetrahydro-2*H*-pyran-4-yl(3*R*,5*R*)-7-[(1*S*,2*S*,6*R*,8*S*,8a*R*)-8-[(2,2-dimethylbutanoyl)oxy]-2,6-dimethyl-1,2,6,7,8,8a-hexahydronaphthalen-1-yl]-3,5-dihydroxyheptanoate (dimer) (simvastatin impurity D) is about 3.8.

Inject test solution (a) and reference solution (b). In the chromatogram obtained with test solution (a) the area of the secondary peaks corresponding to lovastatin and epilovastatin is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent), the area of any secondary peak other than lovastatin and epilovastatin is not more than 0.8 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent). The sum of the areas of all the secondary peaks other than lovastatin and epilovastatin is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13).). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 60° for 3 hours under high vacuum.

Assay. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use.

Solvent mixture. 40 volumes of a 0.14 per cent w/v solution of *potassium dihydrogen phosphate*, adjusted to pH 4.0 with *orthophosphoric acid* and 60 volumes of *acetonitrile*.

Test solution (a). Dissolve 75 mg of the substance under examination in 50.0 ml of the solvent mixture.

Test solution (b). Dissolve 40 mg of the substance under examination in 50.0 ml of the solvent mixture.

Reference solution (a). Dissolve 1 mg each of *simvastatin RS* and *lovastatin RS* in 50.0 ml of the solvent mixture.

Reference solution (b). Dilute 0.5 ml of test solution (a) to 100.0 ml with the solvent mixture.

Reference solution (c). Dissolve 40 mg of *simvastatin RS* in 50.0 ml of the solvent mixture.

Chromatographic system
- a stainless steel column 3.3 cm x 4.6 mm, packed with end-capped octadecylsilane bonded to porous silica (3 µm),
- mobile phase: A. a mixture 50 volumes of *acetonitrile* and 50 volumes of a 0.1 per cent v/v solution of *orthophosphoric acid,*
  B. 0.1 per cent v/v solution of *orthophosphoric acid* in *acetonitrile*,
- a linear gradient programme using the conditions given below,
- flow rate. 3.0 ml per minute,
- spectrophotometer set at 238 nm,
- injection volume. 5 µl.

Time (min)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0–4.5	100	0
4.5–4.6	100 →95	0 →5
4.6–8.0	95 →25	5 →75
8.0–11.5	25	75
11.5–11.6	25 →100	75 →0
11.6–13	100	0

Inject reference solution (a). The test is not valid unless resolution between the peaks due to lovastatin and epilovastatin and simvastatin is not less than 5.0.

Inject test solution (b) and reference solution (c).

Calculate the content of simvastatin.

Storage. Store protected from light and moisture, under nitrogen.

Simvastatin Tablets

Simvastatin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of simvastatin, $C_{25}H_{38}O_5$.

Usual strengths. 10 mg; 20 mg; 40 mg.

Identification

Shake a quantity of the powdered tablets containing about 50 mg of Simvastatin with 20 ml of *dichloromethane*, filter and evaporate the filtrate to dryness using a rotary evaporator and a water-bath at 40°. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *simvastatin RS* or with the reference spectrum of simvastatin.

Tests

Dissolution (2.5.2).

Apparatus No. 1,
Medium. 900 ml of *0.01 M sodium dihydrogen orthophosphate* containing 0.5 per cent w/v of *sodium dodecyl sulphate*, adjusted to pH 7.0 with *1 M sodium hydroxide,*
Speed and time. 50 rpm and 30 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter and transfer 10 ml of the filtrate into a centrifuge tube containing 0.1 g of *pre-washed manganese (IV) oxide*. Shake the tube for 30 minutes, or until the manganese (IV) oxide is completely dispersed, centrifuge and measure the absorbance (2.4.7) of the clear supernatant liquid, suitably diluted if necessary with dissolution medium at the maximum at about 257 nm and the minimum at about 257 nm. Calculate the content of simvastatin, $C_{25}H_{38}O_5$.in the medium from the absorbance obtained from a solution of known concentration of *simvastatin RS,* using the differences in absorbance at 247 nm and at 257 nm.

D. Not less than 70 per cent of the stated amount of $C_{25}H_{38}O_5$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE—Prepare the solutions immediately before use.

Buffer solution. A 0.51 per cent w/v solution of *sodium dihydrogen orthophosphate*, adjusted to pH 4.5 with 25 per cent v/v solution of *orthophosphoric acid.*

Solution A. A mixture of 1 volume of 0.3 per cent v/v solution of *glacial acetic acid*, adjusted to pH 4.0 with *1 M sodium hydroxide* and 4 volumes of *acetonitrile.*

Test solution. Shake a quantity of the powdered tablets containing about 25 mg of Simvastatin with 20 ml of solution A for 15 minutes, dilute to 100 ml and filter.

Reference solution (a). Dilute 1 ml of the test solution to 500 ml with solution A.

Reference solution (b). A solution of 0.002 per cent w/v each of *simvastatin RS* and *lovastatin RS* in solution A.

Chromatographic system

- a stainless steel column 10 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (3µm) (such as Hypersil ODS),
- mobile phase: A. a mixture of 40 volumes of *acetonitrile* and 60 volumes of buffer solution,
  B. a mixture of 20 volumes of buffer solution and 80 volumes of *acetonitrile*,
- a linear gradient programme using the conditions given below,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 238 nm,
- injection volume. 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0 - 5	85	15
5 - 30	85 →0	15 →100
30 - 45	0	100
45 - 46	0 →85	100 →15
46 - 50	85	15

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to simvastatin and lovastatin is not less than 3.0. The relative retention time with reference to simvastatin for simvastatin hydroxy acid (simvastatin impurity A) is about 0.52, for lovastatin (simvastatin impurity E) is about 0.71, for epilovastatin (simvastatin impurity F) is about 0.74, for anhydrosimvastatin (simvastatin impurity C) is about 1.74 and for simvastatin dimer (simvastatin impurity D) is about 2.42.

Inject the test solution and reference solution (a). In the chromatogram obtained with the test solution the area of peaks corresponding to lovastatin and epilovastatin is not more than five times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent), the area of any secondary peak other than lovastatin and epilovastatin is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent). The sum of the areas of all the secondary peaks other than lovastatin and epilovastatin is not more than five times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than 0.25 times of the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solution A. Add 3 ml of *glacial acetic acid* to 900 ml of *water*, adjust the pH to 4.0 with *1 M sodium hydroxide* and add sufficient *water* to produce 1000 ml. Mix 1 volume of this solution with 4 volumes of *acetonitrile.*

Test solution. Disperse a quantity of whole tablets containing about 0.16 g of Simvastatin in *water* and mix with the aid of ultrasound and shaking. Add sufficient of solution A to produce about 75 ml, mix with the aid of ultrasound and shaking for 15 minutes, dilute to 100 ml with solution A and centrifuge. Dilute 1 ml of the clear supernatant solution with sufficient of solution A to produce a solution containing 0.01 per cent w/v of Simvastatin.

Reference solution. A 0.01 per cent w/v solution of *simvastatin RS* in solution A.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm) (such as Hypersil ODS),
- column temperature. 45°,
- mobile phase: a mixture of 7 volumes of a buffer solution prepared by dissolving 5.1 g of *sodium dihydrogen orthophosphate* in 900 ml of *water*, adjusted to pH 4.5 with *orthophosphoric acid* or *1 M sodium hydroxide* and add sufficient *water* to produce 1000 ml and 13 volumes of *acetonitrile*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 238 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor of the principal peak is not more than 2.0.

Inject the test solution and the reference solution.

Calculate the content of $C_{25}H_{38}O_5$ in the tablets.

Sodium Acetate

$CH_3COONa,3H_2O$

$C_2H_3NaO_2, 3H_2O$ Mol. Wt. 136.1

Sodium Acetate contains not less than 99.0 per cent and not more than 101.0 per cent of $C_2H_3NaO_2$, calculated on the dried basis.

Category. Pharmaceutical aid (for peritoneal dialysis fluids).

Description. Colourless crystals or a white, crystalline powder.

Identification

Dissolve 10.0 g in sufficient *carbon dioxide-free water* to produce 100.0 ml (solution A). 1 ml of solution A gives reaction B of acetates and reaction A of sodium salts (2.3.1).

Tests

Appearance of solution. Solution A is clear (2.4.1), and colourless (2.4.1).

pH (2.4.24). 7.5 to 9.0, determined in a 5.0 per cent w/v solution.

Arsenic (2.3.10). Dissolve 5.0 g in 50 ml of *water* and add 15 ml of *stannated hydrochloric acid AsT*. The resulting solution complies with the limit test for arsenic (2 ppm).

Calcium and magnesium. Not more than 50 ppm, calculated as Ca, determined by the following method. Mix 200 ml of *water* with 10 ml of *ammonia buffer pH 10.0*, 0.1 g of *mordant black 11 mixture* and 2 ml of *0.05 M zinc chloride*. Add dropwise *0.02 M disodium edetate* until the colour changes from violet to blue. To this solution add 10 g of the substance under examination, shake to dissolve and titrate with *0.02 M disodium edetate* until the blue colour is restored. Not more than 0.65 ml of *0.02 M disodium edetate* is required.

Heavy metals (2.3.13).12 ml of solution A complies with the limit test for heavy metals, Method D (10 ppm).

Iron (2.3.14). 20 ml of solution A complies with the limit test for iron (20 ppm).

Chlorides (2.3.12). 10 ml of solution A complies with the limit test for chlorides (250 ppm).

Sulphates (2.3.17). 15 ml of solution A complies with the limit test for sulphates (225 ppm).

Reducing substances. Dissolve 1.0 g in 100 ml of boiling *water*, add 5 ml of *1 M sulphuric acid* and 0.5 ml of *0.002 M potassium permanganate*, mix and boil gently for 5 minutes; the pink colour is not completely discharged.

Loss on drying (2.4.19). 39.0 to 40.5 per cent, determined on 0.2 g by drying in an oven at 130°. Place the substance under examination in the oven while the oven is still cold.

Assay. Weigh accurately about 0.25 g, dissolve in 50 ml of *anhydrous glacial acetic acid*, add 5 ml of *acetic anhydride*, mix and allow to stand for 30 minutes. Titrate with *0.1 M perchloric acid*, using 0.3 ml of *1-naphtholbenzein solution* as indicator, until a green colour is produced. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.00820 g of $C_2H_3NaO_2$.

Sodium Acetate intended for use in the preparation of dialysis solutions complies with the following additional requirement.

Aluminium. Dissolve 20 g in 100 ml of *water* and adjust to pH 6.0 by the addition of about 10 ml of *1 M hydrochloric acid*. Extract with successive quantities of 20, 20 and 10 ml of a 0.5 per cent w/v solution of *8-hydroxyquinoline* in *chloroform* and dilute the combined extracts to 50 ml with *chloroform*. Use as the standard solution a mixture of 0.4 ml of *aluminium standard solution (2 ppm Al)*, 10 ml of *acetate buffer pH 6.0* and 98 ml of *water* treated in the same manner and as the blank solution a mixture of 10 ml of *acetate buffer pH 6.0* and 100 ml of *water* treated in the same manner. Measure the fluorescence (2.4.5) of the test solution and the standard solution, using an excitation wavelength of about 392 nm and emission wavelength of about 518 nm, and setting the instrument to zero with the blank solution in each case. The fluorescence of the test solution is not greater than that of the standard solution (0.2 ppm).

Storage. Store protected from light.

Labelling. The label states whether or not the material is intended for use in the manufacture of dialysis solutions.

Sodium Alginate

Sodium Polymannuronate

Sodium Alginate consists mainly of the sodium salt of alginic acid which is a mixture of polyuronic acids $[(C_6H_8O_6)_n]$ composed of residues of D-mannuronic acid and L-guluronic acids and is obtained mainly from algae belonging to the order Phaeophyceae.

Category. Pharmaceutical aid (viscosity-increasing agent).

Description. A cream-coloured to pale yellowish brown powder; almost odourless.

Identification

A. Dissolve 0.2 g with shaking in 20 ml of *water* and to 5 ml of the resulting solution add 1 ml of *calcium chloride solution*; a voluminous gelatinous precipitate is produced.

B. To 10 ml of the solution obtained in test A add 1 ml of *1 M sulphuric acid*; a gelatinous mass is produced.

C. To 5 mg add 5 ml of *water*, 1 ml of a freshly prepared 1 per cent w/v solution of *naphthalene-1,3-diol* in *ethanol (95 per cent)* and 5 ml of *hydrochloric acid*. Boil for 3 minutes, cool, add 5 ml of *water* and shake with 15 ml of *di-isopropyl ether*. The upper layer exhibits a deeper bluish red colour than the upper layer obtained by repeating the procedure without the substance under examination.

D. The residue obtained in the test for Sulphated ash gives reaction A of sodium salts (2.3.1).

Tests

Heavy metals (2.3.13). 0.5 g complies with the limit test for heavy metals, Method B (40 ppm), using *nitric acid* instead of *sulphuric acid* for wetting the sample.

Chloride. Not more than 1.0 per cent, determined by the following method. Shake 2.5 g with 50 ml of *2 M nitric acid* for 1 hour, dilute to 100 ml with 2M nitric acid and filter. To 50 ml of the filtrate add 10.0 ml of *0.1 M silver nitrate* and 5 ml of *toluene*. Titrate with *0.1 M ammonium thiocyanate* using 2 ml of *ferric ammonium sulphate solution* as indicator and shaking vigorously towards the end-point.

1 ml of *0.1 M silver nitrate* is equivalent to 0.00355 g of Cl.

Microbial contamination (2.2.9). Not more than 10^3 micro-organisms per gram. It complies with the test for *Escherichia coli* and *Salmonella.*

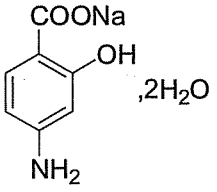
Sulphated ash (2.3.18). 30.0 to 36.0 per cent, determined on 0.1 g and calculated on the dried basis.

Loss on drying (2.4.19). Not more than 15.0 per cent, determined on 0.2 g by drying in an oven at 105° for 4 hours.

Storage. Store protected from light.

Sodium Aminosalicylate

Sodium PAS



$C_7H_6NNaO_3,2H_2O$. Mol. Wt. 211.2

Sodium Aminosalicylate is sodium 4-amino-2-hydroxy-benzoate dihydrate.

Sodium Aminosalicylate contains not less than 99.0 per cent and not more than 101.0 per cent of $C_7H_6NNaO_3$, calculated on the anhydrous basis.

Category. Antitubercular.

Dose. 10 to 15 g daily, in divided doses.

Description. A white to cream coloured crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sodium aminosalicylate RS* or with the reference spectrum of sodium aminosalicylate.

B. A 5 per cent w/v solution complies with the tests for sodium salts (2.3.1).

Tests

pH (2.4.24). 6.5 to 8.5, determined in a 2.0 per cent w/v solution.

3-aminophenol. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50.0 mg of the substance under examination in 100 ml of the mobile phase.

Reference solution (a). Dissolve 25.0 mg of *3-aminophenol RS* in 100.0 ml of the mobile phase (solution A). Dilute 5.0 ml of the solution to 100.0 ml with the mobile phase. Dilute 5.0 ml of the resulting solution to 50.0 ml with the mobile phase.

Reference solution (b). Dissolve 25.0 mg of *sodium aminosalicylate RS* in 100.0 ml of the mobile phase. Dilute 5.0 ml of this solution and 5 ml of solution A to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous base deactivated silica (5 µm) (such as Hypersil BDS),
- mobile phase: dissolve 6.0 g of *disodium hydrogen orthophosphate* and 6.6 g of *sodium dihydrogen orthophosphate dihydrate* in 1600 ml with *water*, add 19 ml of *tetra n-butyl ammonium hydroxide (20 per cent solution)* and make the volume to 1700 ml with *water* and add 300 ml of *methanol,*
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume. 20 µl.

Inject reference solution (a). The relative standard deviation for replicate injections is not more than 5.0 per cent

Inject reference solution (b). The test is not valid unless the resolution between m-aminophenol and sodium aminosalicylate is at least 5.0.

Inject the test solution and reference solution (a). In the chromatogram obtained with the test solution, the area of the peak corresponding to 3-aminophenol is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.25 per cent).

Hydrogen Sulphide and Sulphur dioxide. Dissolve 0.5 g in 5 ml of *1 M sodium hydroxide*, add 6 ml of *3 M hydrochloric acid* and stir vigorously. No odour of hydrogen sulphide or sulpher dioxide is perceptible, and not more than a faint odour of Amyl Alcohol is perceptible. A piece of moistened *lead acetate paper* held over the mixture does not become discoloured.

Arsenic (2.3.10). Mix 5.0 g with 10 ml of *bromine solution* and evaporate to dryness on a water-bath, ignite gently, dissolve the cooled residue, ignoring any carbon, in 50 ml of *water* and 14 ml of *brominated hydrochloric acid AsT* and remove the

excess bromine with a few drops of *stannous chloride solution AsT*. The resulting solution complies with the limit test for arsenic (2 ppm).

Heavy metals (2.3.13). 0.66 g complies with the limit test for heavy metals, Method B (30 ppm).

Chlorides (2.3.12). Dissolve 1.0 g in 10 ml of *water*, add 3 ml of *acetic acid* and filter, dilute the filtrate to 50 ml with *water*. 10 ml of the solution complies with the limit test for chlorides (0.25 per cent).

Sulphates (2.3.17). 0.1 g complies with the limit test for sulphates (0.15 per cent).

Loss on drying (2.4.19). 16.0 to 17.5 per cent, determined on 0.5 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50.0 mg of the substance under examination in 100.0 ml of the mobile phase. Dilute 5.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (a). Dissolve 50.0 mg of *sodium aminosalicylate RS* in 100.0 ml of the mobile phase (solution A). Dilute 5.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 25.0 mg of *3-aminophenol RS* in 100.0 ml of the mobile phase. Dilute 5.0 ml of this solution and 5 ml of solution A to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 6.0 g of *disodium hydrogen orthophosphate* and 6.6 g of *sodium dihydrogen orthophosphate dihydrate* in 1600 ml with *water*, add 19 ml of *tetra n-butyl ammonium hydroxide (20 per cent solution)* and make the volume to 1700 ml with *water* and add 300 ml of *methanol*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Inject reference solution (a). The tailing factor is not more than 2.0. The column efficiency in not less than 3000 theoretical plates. The relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject reference solution (b). The test is not valid unless the resolution between 3-aminophenol and sodium aminosalicylate is at least 5.0.

Inject alternately the test solution and the reference solution.

Calculate the content of $C_7H_6NNaO_3$.

Storage. Store protected from light and moisture.

Sodium Aminosalicylate Tablets

Sodium PAS Tablets

Sodium aminosalicylate tablet contains not less than 95.0 per cent not more than 105.0 per cent of $C_7H_6NNaO_3.2H_2O$.

Usual strengths. 500 mg; 1 g.

Identification

Digest a quantity of powdered tablets containing about 3.0 g of sodium aminosalicylate, with 40 ml of *water*, and filter. Add to the filtrate 15 ml of *1M acetic acid*, and allow it to stand until precipitation has occurred. Collect the precipitate on a filter, wash well with *water* and dry at 105°C for 30 min. The residue complies with the following tests.

A. Place about 1 g of the residue in a small, round-bottom flask, and add 10 ml of *acetic anhydride*. Heat the flask on a steam bath for 30 minutes, and add 40 ml of *water*, mix, filter, cool, and allow to stand until diacetyl derivative crystallizes, wash well with *water*, and dry at 105° for 1 hour. The diacetyl derivative so obtained melts at 191° to 197°.

B. Shake 0.1 g of the residue with 10 ml of *water*, and filter. To 5 ml of the filtrate add 1 drop of *ferric chloride solution*. A violet colour is produced.

C. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

3-aminophenol. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh a quantity of the powder containing about 50 mg of Sodium Aminosalicylate and dissolve in 100 ml of the mobile phase.

Reference solution (a). A 0.024 per cent w/v solution of *m-aminophenol RS* in the mobile phase. Dilute 5 ml to 100 ml with the mobile phase. Dilute 5 ml of the resulting solution to 50 ml with the mobile phase.

Reference solution (b). A 0.024 per cent w/v solution of *sodium aminosalicylate RS* in the mobile phase.

Reference solution (c). Mix 5 ml each of reference solution (a) and reference solution (b) and dilute to 100 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous base deactivated silica (5 µm) (such as Hypersil BDS),
- mobile phase: dissolve 6.0 g of *disodium hydrogen orthophosphate* and 6.6 g of *sodium dihydrogen orthophosphate dihydrate* in 1600 ml with *water*, add

19 ml of *tetra n-butyl ammonium hydroxide (20 per cent aqueous solution)* and make the volume to 1700 ml with *water*, add 300 ml of *methanol*, mix well and degas,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume. 20 µl.

Inject reference solution (a). The relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject reference solution (c). The resolution between 3-aminophenol and sodium aminosalicylate is not less than 5.0.

Inject the test solution and reference solution (a). In the chromatogram obtained with the test solution, the area of the peak corresponding to 3-aminophenol is not more than the area of the peak in the chromatogram obtained with reference solution (a) (1.0 per cent).

Dissolution (2.5.2).

Apparatus. No. 2,
Medium. 900 ml *water*,
Speed and time.100 rpm for 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. The filtrate diluted with the mobile phase to produce a 0.055 per cent w/v solution.

Reference solution. A 0.055 per cent w/v solution of *sodium aminosalicylate RS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 6.0 g of *disodium hydrogen orthophosphate* and 6.6 g of *sodium dihydrogen orthophosphate dihydrate* in 1600 ml with *water*, add 19 ml of *tetra n-butyl ammonium hydroxide (20 per cent aqueous solution)* and make the volume to 1700 ml with *water*, add 300 ml of *methanol*, mix well and degas,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Inject the reference solution. The tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent

Inject alternatively the test solution and the reference solution.

Calculate the content of $C_7H_6NNaO_3.2H_2O$ in the medium.

D. Not less than 75 per cent of the stated amount of $C_7H_6NNaO_3.2H_2O$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 0.5 g of sodium aminosalicylate, add sufficient mobile phase to produce 100.0 ml and filter. Dilute 5.0 ml of this solution to 50.0 ml with the mobile phase.

Reference solution. A 0.05 per cent w/v solution of *sodium aminosalicylate RS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 6.0 g of *disodium hydrogen orthophosphate* and 6.6 g of *sodium dihydrogen orthophosphate dihydrate* in 1600 ml with *water*, add 19 ml of *tetra n-butyl ammonium hydroxide (20 per cent aqueous solution)* and make the volume to 1700 ml with *water*, add 300 ml of *methanol*, mix well and degas,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

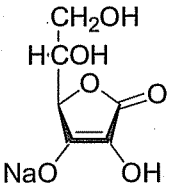
Inject the reference solution. The tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent

Inject alternately the test solution and the reference solution.

Calculate the content of $C_7H_6NNaO_3.2H_2O$ in the tablets.

Storage. Store protected from moisture.

Sodium Ascorbate



$C_6H_7NaO_6$ Mol. Wt. 198.1

Sodium Ascorbate is L-ascorbic acid monosodium salt.

Sodium Ascorbate contains not less than 99.0 per cent and not more than 101.0 per cent of $C_6H_7NaO_6$, calculated on the dried basis.

Category. Vitamin C.

Dose. The equivalent of up to 1 g of ascorbic acid daily.

Description. White or faintly yellow crystals or a crystalline powder; odourless or almost odourless. It darkens gradually on exposure to light.

Identification

Test A may be omitted if tests B, C and D are carried out. Test B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6), Compare the spectrum with that obtained with *sodium ascorbate RS.*

B. To 4 ml of a 2 per cent w/v solution add 1 ml of *0.1 M hydrochloric acid*, add a few ml of *2,6-dichlorophenol-indophenol solution*; the solution is decolorised.

C. To 4 ml of a 2 per cent w/v solution add 1 ml of *0.1 M hydrochloric acid*, add 1 drop of a freshly prepared 5 per cent w/v solution of *sodium nitroprusside* and 2 ml of *dilute sodium hydroxide solution*. Add 0.6 ml of *hydrochloric acid* dropwise and stir; the yellow colour turns blue.

D. A 2 per cent w/v solution gives the reactions of sodium salts (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1) and not more intensely coloured than reference solution BYS7 (2.4.1).

pH (2.4.24). 7.0 to 8.0, determined in a 10.0 per cent w/v solution.

Specific optical rotation (2.4.22). +103° to +108°, determined in a 10.0 per cent w/v solution.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

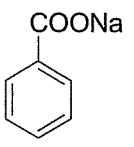
Loss on drying (2.4.19). Not more than 0.25 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa for 24 hours.

Assay. Weigh accurately about 0.2 g, dissolve in a mixture of 100 ml of *carbon dioxide-free water* and 25 ml of *1 M sulphuric acid.* Titrate immediately with *0.05 M iodine*, using 1 ml of *starch solution* as indicator, until a persistent violet-blue colour is obtained.

1 ml of *0.05 M iodine* is equivalent to 0.009905 g of $C_6H_7NaO_6$.

Storage. Store protected from light.

Sodium Benzoate



$C_7H_5NaO_2$ Mol. Wt. 144.1

Sodium Benzoate contains not less than 99.0 per cent and not more than 100.5 per cent of $C_7H_5NaO_2$, calculated on the dried basis.

Category. Pharmaceutical aid (preservative).

Description. A white, crystalline or granular powder or flakes; odourless or with a faint odour; hygroscopic.

Identification

A. To a 10 per cent w/v solution add *ferric chloride test solution*; a buff coloured precipitate is formed. Add *dilute hydrochloric acid*; a white crystalline precipitate is produced.

B. Gives the reactions of sodium salts and reactions B and C of benzoates (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and not more intensely coloured than reference solution YS6 (2.4.1).

Acidity or alkalinity. To 20 ml of a 5.0 per cent w/v solution in *carbon dioxide-free water* add 0.2 ml of *phenolphthalein solution*. Not more than 0.2 ml of *0.1 M hydrochloric acid* or 0.2 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution.

Arsenic (2.3.10). Mix 5.0 g with 10 ml of *bromine solution* and evaporate to dryness on a water-bath. Ignite gently, dissolve the cooled residue, ignoring any carbon, in 50 ml of *water* and 14 ml of *brominated hydrochloric acid AsT*, and remove the excess of *bromine* with 2 ml of *stannous* Chloride *solution AsT*. The resulting solution complies with the limit test for arsenic (2 ppm).

Heavy metals (2.3.13). Dissolve 2.0 g in 45 ml of *water* and 5 ml of *hydrochloric acid.* 25 ml of the solution complies with the limit test for heavy metals, Method B (20 ppm).

Chlorinated compounds. Dissolve 0.33 g in 5 ml of *0.5 M sodium carbonate*, evaporate to dryness and heat the residue until completely charred, keeping the temperature below 400°. Extract the residue with a mixture of 10 ml of *water* and 12 ml of *dilute nitric acid* and filter; the filtrate complies with the limit test for chlorides (2.3.12).

Loss on drying (2.4.19). Not more than 2.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.25 g, dissolve in 20 ml of *anhydrous glacial acetic acid*, warming to 50° if necessary, cool. Titrate with *0.1 M perchloric acid*, using 0.05 ml of *1-naphtholbenzein solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01441 g of $C_7H_5NaO_2$.

Storage. Store protected from light.

Sodium Bicarbonate

Sodium Hydrogen Carbonate

$NaHCO_3$ Mol. Wt. 84.0

Sodium Bicarbonate contains not less than 99.0 per cent and not more than 101.0 per cent of $NaHCO_3$.

Category. Electrolyte replenisher; systemic alkaliser.

Dose. 1 to 4 g.

Description. A white, crystalline powder or small, opaque, monoclinic crystals. It gradually forms sodium carbonate on heating in the dry state or in solution.

Identification

A. To 5 ml of a 5.0 per cent w/v solution in *carbon dioxide-free water* (solution A) add 0.1 ml of *phenolphthalein solution*; a pale pink colour is produced. On heating, a gas is evolved and the solution becomes red.

B. Gives reaction A of bicarbonates (2.3.1).

C. Solution A gives the reactions of sodium salts (2.3.1).

Tests

Appearance of solution. Solution A is clear (2.4.1), and colourless (2.4.1).

Arsenic (2.3.10). Dissolve 5.0 g in 50 ml of *water*, add 15 ml of *brominated hydrochloric acid AsT* and remove the excess of *bromine* with a few drops of *stannous chloride solution AsT*. The resulting solution complies with the limit test for arsenic (2 ppm).

Calcium. A 2.0 per cent w/v solution, when boiled for 5 minutes, is clear.

Heavy metals (2.3.13). Mix 4.0 g with 5 ml of *water* and 18 ml of *dilute hydrochloric acid*, heat to boiling and maintain that temperature for 1 minute. Add 0.05 ml of *phenolphthalein solution* and sufficient *5 M ammonia* dropwise to give the solution a faint pink colour, cool and dilute to 25 ml with *water*. The solution complies with the limit test for heavy metals, Method A (5 ppm).

Iron (2.3.14). Dissolve 2.0 g in 20 ml of *water* and 4 ml of *hydrochloric acid* and dilute to 40 ml with *water*; the resulting solution complies with the limit test for iron (20 ppm).

Carbonate. pH of solution A, when freshly prepared, not more than 8.6.

Chlorides (2.3.12). 1.25 g dissolved in 15 ml of *water* and 2 ml of *nitric acid* complies with the limit test for chlorides (200 ppm).

Sulphates (2.3.17). Suspend 1.0 g in 10 ml of *distilled water*, neutralise with *hydrochloric acid* and dilute to 15 ml with *distilled water*. The resulting solution complies with the limit test for sulphates (150 ppm).

Assay. Weigh accurately about 1.5 g, dissolve in 50 ml of *carbon dioxide-free water* and titrate with *1 M hydrochloric acid* using 0.2 ml of *methyl orange solution* as indicator.

1 ml of *1 M hydrochloric acid* is equivalent to 0.08401 g of $NaHCO_3$.

Storage. Store protected from moisture.

Sodium Bicarbonate Injection

Sodium Bicarbonate Intravenous Infusion

Sodium Bicarbonate Injection is a sterile solution of Sodium Bicarbonate in Water for Injections.

Sodium Bicarbonate Injection contains not less than 94.0 per cent and not more than 106.0 per cent of the stated amount of sodium bicarbonate, $NaHCO_3$.

Category. Electrolyte replenisher; systemic alkaliser.

Usual strengths. 1.4, 4.2, 5.0, 7.5 and 8.4 per cent w/v.

Description. A clear, colourless solution.

Identification

A. The residue on evaporation, when moistened with *hydrochloric acid* and introduced on a platinum wire into a flame, imparts a yellow colour to the flame.

B. Gives reaction A of sodium salts and the reactions of bicarbonates (2.3.1).

Tests

pH (2.4.24). 7.0 to 8.5.

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. Titrate a volume containing 1.5 g of Sodium Bicarbonate with *1 M hydrochloric acid* using *methyl orange solution* as indicator.

1 ml of *1 M hydrochloric acid* is equivalent to 0.08401 g of $NaHCO_3$.

Storage. Store in single dose containers.

Labelling. The label states (1) the strength as the percentage w/v of Sodium Bicarbonate; (2) the approximate concentrations, in millimoles per litre, of the sodium ions and the bicarbonate ions; (3) that an injection containing visible particles in the solution should not be used.

Sodium Carbonate

Na_2CO_3 Mol. Wt. 106.0 (anhydrous)

Na_2CO_3, H_2O Mol.Wt.124.0 (monohydrate)

Sodium Carbonate is anhydrous or contains one molecule of water of hydration.

Sodium Carbonate contains not less than 99.5 per cent and not more than 100.5 per cent of Na_2CO_3, calculated on the dried basis.

Category. Pharmaceutical aid (alkalising agent)

Description. *Anhydrous* — A white or almost white, slightly granular powder, hygroscopic.

Monohydrate — A white, crystalline powder or colourless crystals.

Identification

A. Dissolve 1 g in *water* and dilute to 10 ml with *water*; the solution is strongly alkaline.

B. The solution prepared for test A gives reaction A of carbonates and reactions of sodium salts (2.3.1)

Tests

Appearance of solution. Dissolve 2.0 g in 10 ml of *water*. The resulting solution is clear and not more intensely coloured than reference solution YS6, (2.4.1).

Alkali hydroxides and bicarbonates. Dissolve 0.4 g in 20 ml of *water*, add 20 ml of *barium chloride solution* and filter. To 10 ml of the filtrate add 0.1 ml of *phenolphthalein solution*. The solution does not become red. Heat the remainder of the filtrate to boiling for 2 minutes. The solution remains clear.

Heavy metals (2.3.13). Dissolve 2.0 g in portions in a mixture of 5 ml of hydrochloric acid and 25 ml of water. Heat the solution to boiling and cool. Add dilute sodium hydroxide solution until the solution is neutral. Dilute to 50 ml with water (solution A). 12 ml of the resulting solution complies with the limit test for heavy metals, Method A (50 ppm). Use lead standard solution (2 ppm Pb) for the standard.

Iron (2.3.14). Dilute 5 ml of solution A to 10 ml with water. The solution complies with the limit test for iron (50 ppm).

Chlorides (2.3.12). Dissolve 0.4 g in water, add 4 ml of dilute nitric acid and dilute to 15 ml with water. The solution complies with the limit test for chlorides (125 ppm).

Sulphates (2.3.17). 15 ml of solution A complies with the limit test for sulphates, (250 ppm).

Loss on drying (2.4.19). Not more than 1.0 per cent (for anhydrous form) or between 12.0 per cent and 15.0 per cent (for monohydrate form), determined on 2.0 g by drying in an oven at 300°.

Assay. Weigh accurately about 1.0 g, dissolve in 25 ml of *water* and titrate with *1 M hydrochloric acid* using *methyl orange solution* as indicator.

1 ml of *1 M hydrochloric acid* is equivalent to 0.05299 g of Na_2CO_3.

Storage. Store in tightly-closed, non-metallic containers.

Labelling. The label states whether the material is anhydrous or monohydrate.

Sodium Chloride

NaCl Mol. Wt. 58.4

Sodium Chloride contains not less than 99.0 per cent and not more than 100.5 per cent of NaCl, calculated on the dried basis.

Category. Pharmaceutical aid (tonicity agent); fluid and electrolyte replenisher.

Description. White or colourless crystals or a white crystalline powder.

Identification

A. Gives the reactions of chlorides (2.3.1).

B. A 20 per cent w/v solution in *carbon dioxide-free water* prepared from *distilled water* (solution A) gives the reactions of sodium salts (2.3.1).

Tests

Appearance of solution. Solution A is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. To 20 ml of solution A add 0.1 ml of *bromothymol blue solution*; not more than 0.5 ml of *0.01 M hydrochloric acid* or of *0.01 M sodium hydroxide* is required to change the colour of the solution.

Arsenic (2.3.10). Dissolve 10.0 g in 50 ml of *water* and 12 ml of *stannated hydrochloric acid AsT*. The resulting solution complies with the limit test for arsenic (1 ppm).

Barium. Dissolve 2 g in 10 ml of *water*, and add 2 ml of *dilute sulphuric acid*; no turbidity is produced within 2 hours.

Bromide. To 0.5 ml of solution A add 4.0 ml of *water*, 2.0 ml of *phenol red reagent* and 1.0 ml of 0.01 per cent w/v solution of *chloramine T* and mix immediately. After exactly 2 minutes, add 0.15 ml of *0.1 M sodium thiosulphate*, mix and dilute to 10.0 ml with *water*. The absorbance of the solution measured at about 590 nm (2.4.7), using *water* as the blank, is not more than that of the standard solution prepared at the same time and in the same manner, using 5.0 ml of a 0.0003 per cent w/v solution of *potassium bromide* (100 ppm).

Calcium and magnesium. Not more than 50 ppm, calculated as Ca, determined by the following method. Dissolve 20.0 g in 200 ml of *water*, and add 0.1 ml of *hydrochloric acid*, 5 ml of *strong ammonia-ammonium chloride solution*, 5 drops of *eriochrome black T solution* and titrate with *0.005 M disodium edetate* to a blue end-point.

1 ml of *0.005 M disodium edetate* is equivalent to 0.0002004 g of Ca.

Ferrocyanide. Dissolve 2.0 g in 6 ml of *water* and add 0.5 ml of a mixture of 5 ml of a 1 per cent w/v solution of *ferric ammonium sulphate* in a 0.25 per cent w/v solution of *sulphuric acid*, and 95 ml of a 1 per cent w/v solution of *ferrous sulphate*; no blue colour is produced within 10 minutes.

Heavy metals (2.3.13). 4.0 g in 2 ml of *dilute acetic acid* and sufficient *water* to produce 25 ml. The solution complies with the limit test for heavy metals, Method A (5 ppm).

Iodide. Moisten 5 g by adding dropwise, a solution freshly prepared by mixing 25 ml of *iodide-free starch solution* 2 ml of *0.5 M sulphuric acid*, 0.15 ml of *sodium nitrite solution* and 25 ml of *water* and examine the mixture in daylight; the substance shows no blue colour after 5 minutes.

Iron (2.3.14). 2.0 g dissolved in 20 ml of *water* complies with the limit test for iron (20 ppm).

Sulphates (2.3.17). 2.5 ml of solution A diluted to 15 ml with *water* complies with the limit test for sulphates (300 ppm).

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Weigh accurately about 0.1 g and dissolve in 50 ml of *water* in a glass-stoppered flask. Add 50.0 ml of *0.1 M silver nitrate*, 5 ml of *2 M nitric acid* and 2 ml of *dibutyl phthalate*, shake well and titrate with *0.1 M ammonium thiocyanate* using 2 ml of *ferric ammonium sulphate solution* as indicator, until the colour becomes reddish yellow.

1 ml of *0.1 M silver nitrate* is equivalent to 0.005844 g of NaCl.

Sodium *Chloride* intended for use in the manufacture of parenteral preparations or in the manufacture of dialysis solutions complies with the following additional requirement.

Potassium. Not more than 0.1 per cent, determined by flame photometry (2.4.4), using a 1.0 per cent w/v solution and measuring at 768 nm. Use suitable dilutions in *water* of *potassium solution FP* for the standard solution.

Sodium *Chloride* intended for use in the preparation of dialysis solutions complies with the following additional requirement.

Aluminium. Not more than 0.2 ppm, determined by the following method. Dissolve 20 g in 100 ml of *water* and add 10 ml of *acetate buffer pH 6.0*. Extract the resulting solution with successive quantities of 20, 20 and 10 ml of a 0.5 per cent w/v solution of *8-hydroxyquinoline* in *chloroform* and dilute the combined extracts to 50 ml with *chloroform*. Use as the blank solution a mixture of 10 ml of *acetate buffer pH 6.0* and 100 ml of *water* treated in the same manner and as the standard solution a mixture of 2 ml of *aluminium standard solution (2 ppm Al)*, 10 ml of *acetate buffer pH 6.0* and 90 ml of *water* treated in the same manner. Measure the fluorescence of the test solution and of the standard solution (2.4.5), using an excitation wavelength of 392 nm and a secondary filter with a transmission band centered at 518 nm, or a monochromator set to transmit at this wavelength, and setting the instrument to zero with the blank solution in each case. The fluorescence of the test solution is not greater than that of the standard solution.

Storage. Store protected from light.

Labelling. The label states whether or not the material is suitable for use in the manufacture of parenteral preparations or for the preparation of dialysis solutions.

Sodium Chloride and Dextrose Injection

Sodium Chloride and Dextrose Intravenous Infusion; Sodium Chloride and Glucose Injection; Sodium Chloride and Glucose Intravenous Infusion

Sodium Chloride and Dextrose Injection is a sterile solution of Sodium Chloride and Dextrose in Water for Injections.

Sodium Chloride and Dextrose Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amounts of sodium chloride, NaCl, and dextrose, $C_6H_{12}O_6$.

Usual strengths. Injections containing the following amounts of Sodium Chloride, NaCl and Dextrose, $C_6H_{12}O_6$.

Per centage w/v of sodium chloride (NaCl)	Percentage w/v of dextrose ($C_6H_{12}O_6$)	Percentage w/v of sodium chloride (NaCl)	Percentage w/v of dextrose ($C_6H_{12}O_6$)
0.11	5		
0.18	5	0.45	5
0.2	5	0.45	10
0.225	5	0.9	2.5
0.3	5	0.9	5
0.33	5	0.9	10
0.45	2.5	0.9	25

Description. A clear, colourless or faintly straw-coloured solution.

Identification

A. To 1 ml add 0.05 ml of *potassium cupri-tartrate solution*; the solution remains blue and clear. Heat to boiling, a copious red precipitate is formed.

B. Gives reaction B of sodium salts and reaction A of chlorides (2.3.1).

Tests

pH (2.4.24). 3.5 to 6.5.

5-Hydroxymethylfurfural and related substances. Dilute a volume containing 1.0 g of dextrose, $C_6H_{12}O_6$, to 500 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 284 nm (2.4.7); absorbance at about 284 nm, not more than 0.25.

Bacterial endotoxins (2.2.3). Not more than 10 Endotoxin Units per g of dextrose.

Other tests. Complies with the tests stated under Parenteral Preparations (Intravenous Infusions).

Assay. *For sodium chloride* — Titrate an accurately measured volume containing 0.1 g of Sodium Chloride with *0.1 M silver nitrate* using *potassium chromate solution* as indicator.

1 ml of *0.1 M silver nitrate* is equivalent to 0.005844 g of NaCl.

For dextrose — To an accurately measured volume containing 2 to 5 g of anhydrous dextrose, $C_6H_{12}O_6$, add 0.2 ml of *5 M ammonia* and sufficient *water* to produce 100.0 ml. Mix well, allow to stand for 30 minutes and measure the optical rotation in a 2-dm tube (2.4.22). The observed rotation in degrees multiplied by 0.9477 represents the weight, in g, of dextrose, $C_6H_{12}O_6$, in the volume of the injection taken for assay.

Storage. Store in single dose containers. On keeping, small solid particles may separate from a glass container.

Labelling. The label states (1) the strength as the percentages w/v of Sodium Chloride and Dextrose; (2) that a solution containing visible particles must not be used.

When the preparation is intended for intravenous infusion, the label states the approximate concentrations, in millimoles per litre, of the sodium and chloride ions and the number of grams per litre of dextrose, $C_6H_{12}O_6$.

Sodium Chloride and Fructose Injection

Sodium Chloride and Fructose Intravenous Infusion; Sodium Chloride and Fructose Infusion; Fructose and Sodium Chloride Injection.

Sodium Chloride and Fructose Injection is a sterile solution of Sodium Chloride and Fructose in Water for Injections.

Sodium Chloride and Fructose Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amounts of sodium chloride, NaCl, and fructose, $C_6H_{12}O_6$. It contains no antimicrobial agent.

Usual strengths. Injections containing the following amounts of Sodium Chloride, NaCl, and Fructose, $C_6H_{12}O_6$.

Per cent w/v of Sodium Chloride (NaCl)	Per cent w/v of Fructose ($C_6H_{12}O_6$)	Per cent w/v of Sodium Chloride (NaCl)	Per cent w/v of Fructose ($C_6H_{12}O_6$)
0.11	5	0.45	2.5
0.18	5	0.45	10
0.225	5	0.9	2.5
0.33	5	0.9	5
0.45	5	0.9	10

Description. A clear, colourless or faintly straw-coloured solution.

Identification

A. To 1 ml add 0.05 ml of *potassium cupri-tartrate solution*; the solution remains blue and clear. Heat to boiling, a copious red precipitate is formed.

B. The solution prepared in the Assay is laevo-rotatory.

C. Gives reaction B of sodium salts and reaction A of chlorides (2.3.1).

Tests

pH (2.4.24). 3.0 to 6.0.

5-Hydroxymethylfurfural and related substances. Dilute a volume containing 1.0 g of Fructose to 500.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 284 nm (2.4.7); absorbance at about 284 nm, not more than 0.50.

Heavy metals (2.3.13). Evaporate a volume containing 4.0 g of Fructose to 10 ml and add 2 ml of *dilute acetic acid* and sufficient *water* to produce 25 ml. The solution complies with the limit test for heavy metals, Method A (5 ppm).

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Assay. *For sodium chloride* — Titrate an accurately measured volume containing about 0.1 g of Sodium Chloride with *0.1 M silver nitrate* using *potassium chromate solution* as indicator.

1 ml of *0.1 M silver nitrate* is equivalent to 0.005844 g of NaCl.

For fructose — To an accurately measured volume containing about 5.0 g of Fructose, add 0.2 ml of *6 M ammonia* and sufficient *water* to produce 100.0 ml. Mix well, allow to stand for 30 minutes and measure the optical rotation in a 2-dm tube (2.4.22). The observed rotation in degrees multiplied by 0.5427 represents the weight, in g, of fructose, $C_6H_{12}O_6$, in the volume taken for assay.

Storage. Store in single dose containers. On keeping, small solid particles may separate from glass containers.

Labelling. The label states (1) the strength as the percentages w/v of Sodium Chloride and Fructose; (2) when the preparation is intended for intravenous infusion, the approximate concentrations, in millimoles per litre, of the sodium and chloride ions and the number of grams per litre of fructose; (3) that a solution containing visible particles should not be used.

Compound Sodium Chloride and Dextrose Injection

Compound Sodium Chloride and Dextrose Intravenous Infusion

Compound Sodium Chloride and Dextrose Injection is a sterile solution containing 0.86 per cent w/v of Sodium Chloride, 0.03 per cent w/v of Potassium Chloride, 0.033 per cent w/v of Calcium Chloride and 5 per cent w/v of Dextrose in Water for Injections.

Compound Sodium Chloride and Dextrose Injection contains not less than 0.82 per cent and not more than 0.90 per cent w/v of sodium chloride, NaCl, not less than 0.0285 per cent and not more than 0.0315 per cent w/v of potassium chloride, KCl, not less than 0.030 per cent and not more than 0.036 per cent w/v of calcium chloride, $CaCl_2,2H_2O$, and not less than 0.523 per cent and not more than 0.580 per cent w/v of chloride, Cl, and not less than 4.75 per cent and not more than 5.25 per cent w/v of dextrose, $C_6H_{12}O_6$. It contains no antimicrobial agent.

Category. Fluid and electrolyte replenisher.

Description. A clear, colourless or faintly straw-coloured solution.

Identification

A. To 1 ml add 0.05 ml of *potassium cupri-tartrate solution*; the solution remains blue and clear. Heat to boiling, a copious red precipitate is formed.

B. Gives reaction B of sodium salts and reaction A of chlorides (2.3.1).

C. After evaporation to one half of its original volume, the solution gives reaction A of potassium salts and reaction B of calcium salts (2.3.1).

Tests

pH (2.4.24). 3.5 to 6.5.

5-Hydroxymethylfurfural and related substances. Dilute a volume containing 1.0 g of Dextrose to 500.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 284 nm; absorbance at about 284 nm, not more than 0.25 (2.4.7).

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. *For sodium chloride* — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 589 nm and using *sodium solution FP* or *sodium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

1 g of Na is equivalent to 2.542 g of NaCl.

For potassium chloride — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 767 nm and using *potassium solution FP* or *potassium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

1 g of K is equivalent to 1.907 g of KCl.

For calcium chloride — To 50.0 ml add 5.0 ml of *0.01 M magnesium sulphate* and 5 ml of *ammonia buffer pH 10.9* and titrate with *0.01 M disodium edetate* using *eriochrome black T mixture* as indicator. From the volume of *0.01 M disodium edetate* required subtract the volume of *0.01 M magnesium sulphate* added.

1 ml of the remainder of *0.01 M disodium edetate* is equivalent to 0.00147 g of $CaCl_2, 2H_2O$.

For total chloride — To 20.0 ml add 30 ml of *water*, 50.0 ml of *0.1 M silver nitrate* and 2 ml of *nitric acid*. Filter, wash the precipitate with *water* slightly acidified with *nitric acid* and titrate the excess of silver nitrate with *0.1 M ammonium thiocyanate* using *ferric ammonium sulphate solution* as indicator until a reddish yellow colour is produced. Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of total Chloride, calculated as Cl.

For dextrose — To an accurately measured volume containing 2 g to 5 g of Dextrose, add 0.2 ml of *5 M ammonia* and sufficient

water to produce 100.0 ml. Mix well, allow to stand for 30 minutes and measure the optical rotation in a 2-dm tube (2.4.22). The observed rotation in degrees multiplied by 0.9477 represents the weight, in g, of dextrose, $C_6H_{12}O_6$, in the volume taken for assay.

Storage. Store in single dose containers of glass or plastic at a temperature not exceeding 30°. On keeping, small solid particles may separate from the solution in glass containers.

Labelling. The label states (1) the strength as the percentages w/v of Sodium Chloride, Potassium Chloride, Calcium Chloride and Dextrose; (2) that the injection contains, in millimoles per litre, the following approximate amounts of the ions. sodium, 147.5, potassium, 4, calcium, 4.5, and Chloride, 156; (3) the total osmolar concentration in mOsmol per litre; (4) that the injection should not be used if it contains visible particles.

Sodium Chloride Hypertonic Injection

Hypertonic Saline

Sodium Chloride Hypertonic Injection is a sterile 1.6 per cent w/v solution of Sodium Chloride in Water for Injections. It contains no antimicrobial agent.

Sodium Chloride Hypertonic Injection contains not less than 1.52 per cent w/v and not more than 1.68 per cent w/v of sodium chloride, NaCl.

Description. A clear, colourless solution.

Identification

Gives the reactions of sodium salts and reaction A of chlorides (2.3.1).

Tests

pH (2.4.24). 5.0 to 7.5.

Heavy metals (2.3.13). Evaporate 40 ml to about 20 ml, add 2 ml of *dilute acetic acid* and dilute to 25 ml with *water*. The solution complies with the limit test for heavy metals, Method A (0.5 ppm).

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Complies with the tests stated under Parenteral Preparations (Intravenous Infusions).

Assay. To an accurately measured volume containing about 0.16 g of Sodium Chloride in a glass-stoppered flask add 50 ml of *water* and 50.0 ml of *0.1 M silver nitrate*, 5 ml of *2 M nitric acid* and 2 ml of *dibutyl phthalate*. Shake well and titrate with *0.1 M ammonium thiocyanate* using 2 ml of *ferric ammonium sulphate solution* as indicator, until the colour becomes reddish yellow.

1 ml of *0.1 M silver nitrate* is equivalent to 0.005844 g of NaCl.

Storage. Store in single dose containers of glass or plastic. On keeping, small solid particles may separate from a glass container.

Labelling. The label states (1) the strength as the percentage w/v of Sodium Chloride; (2) that a solution containing visible solid particles must not be used.

When the preparation is intended for intravenous infusion, the label states that the injection contains approximately 270 millimoles each of sodium and chloride ions per litre.

Sodium Chloride Injection

Sodium Chloride Intravenous Infusion

Sodium Chloride Injection is a sterile 0.9 per cent w/v solution of Sodium Chloride in Water for Injections. It contains no antimicrobial agent.

Sodium Chloride Injection contains not less than 0.85 per cent w/v and not more than 0.95 per cent w/v of sodium Chloride, NaCl.

Description. A clear, colourless solution.

Identification

Gives the reactions of sodium salts and reaction A of chlorides (2.3.1).

Tests

pH (2.4.24). 4.5 to 7.0.

Heavy metals (2.3.13). Evaporate 67 ml to about 20 ml, add 2 ml of *dilute acetic acid* and dilute to 25 ml with *water*. The solution complies with the limit test for heavy metals, Method A (0.3 ppm).

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Complies with the tests stated under Parenteral Preparations (Intravenous Infusions).

Assay. To an accurately measured volume containing about 0.16 g of Sodium Chloride in a glass-stoppered flask add 50 ml of *water* and 50.0 ml of *0.1 M silver nitrate*, 5 ml of *2 M nitric acid* and 2 ml of *dibutyl phthalate*. Shake well and titrate with *0.1 M ammonium thiocyanate* using 2 ml of *ferric ammonium sulphate solution* as indicator, until the colour becomes reddish yellow.

1 ml of *0.1 M silver nitrate* is equivalent to 0.005844 g of NaCl.

Storage. Store in single dose containers of glass or plastic. On keeping, small solid particles may separate from a glass container.

Labelling. The label states (1) the strength as the percentage w/v of Sodium Chloride; (2) that a solution containing visible solid particles must not be used.

When the preparation is intended for intravenous infusion, the label states that the injection contains approximately 150 millimoles each of sodium and chloride ions per litre.

Compound Sodium Chloride Injection

Ringer's Injection

Compound Sodium Chloride Injection is a sterile solution containing 0.86 per cent w/v of Sodium Chloride, 0.03 per cent w/v of Potassium Chloride and 0.033 per cent w/v of Calcium Chloride in Water for Injections. It contains no antimicrobial agent.

Compound Sodium Chloride Injection contains not less than 0.82 per cent w/v and not more than 0.90 per cent w/v of sodium chloride, NaCl, not less than 0.0285 per cent w/v and not more than 0.0315 per cent w/v of potassium chloride, KCl, and not less than 0.030 per cent w/v and not more than 0.036 per cent w/v of calcium chloride, $CaCl_2, 2H_2O$.

Description. A clear, colourless solution.

Identification

Gives reaction B of sodium salts and reaction A of chlorides (2.3.1). When concentrated to one half of its original volume, it gives reaction A of potassium salts and reaction B of calcium salts (2.3.1).

Tests

pH (2.4.24). 5.0 to 7.5.

Heavy metals (2.3.13). Evaporate 67 ml to about 20 ml, add 2 ml of *dilute acetic acid* and dilute to 25 ml with *water*. The solution complies with the limit test for heavy metals, Method A (0.3 ppm).

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Complies with the tests stated under Parenteral Preparations (Intravenous Infusions).

Assay. *For sodium chloride* — Dilute appropriately with water and determine by Method A for flame photometry (2.4.4), measuring at 589 nm or by Method A for atomic absorption spectrophotometry (2.4.2), using sodium solution FP, suitably diluted with water for the standard solutions.

1 g of Na is equivalent to 2.54 g of NaCl.

For potassium Chloride — Dilute appropriately with *water* and determine by Method A for flame photometry (2.4.4), measuring at 767 nm or by Method A for atomic absorption spectrophotometry (2.4.2), using *potassium solution FP*, suitably diluted with water for the standard solutions.

1 g of K is equivalent to 1.007 g of KCl.

For Calcim Chloride — To 50.0 ml add 5.0 ml of *0.01 M magnesium sulphate* and 5 ml of *ammonia buffer pH 10.9* and titrate with 0.01M disodium edetate using *mordant black II mixture* as indicator. From the volume of *0.01 M disodium edetate* required subtract the volume of 0.01M magnesium sulphate added.

1 ml of the remainder of *0.01 M disodium edetate* is equivalent to 0.00147 g of $CaCl_2, 2H_2O$.

Storage. Store in single dose containers of glass or plastic. On keeping, small solid particles may separate from a glass container.

Labelling. The label states (1) the strength as the percentages w/v of Sodium Chloride, Potassium Chloride and Calcium Chloride; (2) that a solution containing visible solid particles must not be used.

When the preparation is intended for intravenous infusion, the label states that the Injection contains in millimoles per litre, the following approximate amounts of ions; sodium, 147.5; potassium, 4; calcium, 2.25 and chloride, 156.

Compound Sodium Chloride Solution

Ringer's Solution

Compound Sodium Chloride Solution is a solution containing 0.86 per cent w/v of Sodium Chloride, 0.03 per cent w/v of Potassium Chloride and 0.033 per cent w/v of Calcium Chloride in Purified Water. The solution may be clarified by filtration.

Compound Sodium Chloride Solution contains not less than 0.82 per cent w/v and not more than 0.90 per cent of sodium chloride, NaCl, not less than 0.025 per cent and not more than 0.035 per cent w/v of potassium chloride, KCl, and not less than 0.030 per cent and not more than 0.036 per cent w/v of calcium chloride, $CaCl_2, 2H_2O$.

Category. Irrigation solution (for external use).

Description. A clear, colourless solution.

Identification

Gives reaction B of sodium salts and reaction A of chlorides (2.3.1). When concentrated to one half of its original volume,

it gives reaction A of potassium salts and reaction B of calcium salts (2.3.1).

Tests

pH (2.4.24). 5.0 to 7.5.

Heavy metals (2.3.13). Evaporate 67 ml to about 20 ml, add 2 ml of *dilute acetic acid* and dilute to 25 ml with *water*. The solution complies with the limit test for heavy metals, Method A (0.3 ppm).

Assay. *For sodium chloride* — Dilute appropriately with water and determine by Method A for flame photometry (2.4.4), measuring at 589 nm or by Method A for atomic absorption spectrophotometry (2.4.2), using *sodium solution FP,* suitably diluted with water for the standard solutions.

1 g of Na is equivalent to 2.54 g of NaCl.

For potassium chloride — Dilute appropriately with water and determine by Method A for flame photometry (2.4.4), measuring at 767 nm or by Method A for atomic absorption spectrophotometry (2.4.2), using *potassium solution FP,* suitably diluted with water for the standard solutions.

1 g of K is equivalent to 1.007 g of KCl.

For calcium Chloride — To 50.0 ml add 5.0 ml of *0.01 M magnesium sulphate* and 5 ml of *ammonia buffer pH 10.9* and titrate with *0.01 M disodium edetate* using *mordant black II mixture* as indicator. From the volume of *0.01 M disodium edetate* required subtract the volume of 0.01M magnesium sulphate added.

1 ml of the remainder of *0.01 M disodium edetate* is equivalent to 0.00147 g of $CaCl_2, 2H_2O$.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from light.

Labelling. The label states the strength as the percentages w/v of Sodium Chloride, Potassium Chloride and Calcium Chloride. If the contents of the container are sterile, the label states (1) Sterile Compound Sodium Chloride Solution; (2) that the solution is not intended for injection.

Sodium Chloride Irrigation Solution

Sodium Chloride Irrigation Solution is a sterile solution containing 0.9 per cent w/v of Sodium Chloride in Water for Injections.

Sodium Chloride Irrigation Solution contains not less than 0.85 per cent w/v and not more than 0.95 per cent w/v of sodium Chloride, NaCl. It contains no antimicrobial agent.

Description. A clear, colourless solution.

Identification

Gives the reactions of sodium salts and reaction A of chlorides (2.3.1).

Tests

pH (2.4.24). 4.5 to 7.0.

Heavy metals (2.3.13). Evaporate 67 ml to about 20 ml, add 2 ml of *dilute acetic acid* and dilute to 25 ml with *water*. The solution complies with limit test for heavy metals, Method A (0.3 ppm).

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. Titrate an accurately measured volume containing about 0.135 g of Sodium Chloride with *0.1 M silver nitrate* using *potassium chromate solution* as indicator.

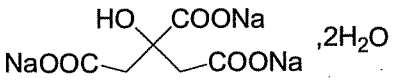
1 ml of *0.1 M silver nitrate* is equivalent to 0.005844 g of NaCl.

Storage. Store in single dose containers. The container may be designed to empty rapidly and may contain a volume of more than 1 litre.

Labelling. The label states (1) the strength as the percentage w/v of Sodium Chloride; (2) that the solution should not be used if it contains visible particles; (3) 'For Irrigation only' and 'Not for Injection'; (4) that once the container is opened, the unused portion should be discarded.

Sodium Citrate

Trisodium Citrate



$C_6H_5Na_3O_7,2H_2O$ Mol. Wt. 294.1

Sodium Citrate is trisodium 2-hydroxypropane-1,2,3-tricarboxylate dihydrate.

Sodium Citrate contains not less than 99.0 per cent and not more than 101.0 per cent of $C_6H_5Na_3O_7$, calculated on the anhydrous basis.

Category. Systemic alkalinising agent.

Dose. 1 to 10 g.

Description. White, granular crystals or a white, crystalline powder; odourless; slightly deliquescent in moist air.

Identification

A. 10.0 per cent w/v solution in *carbon dioxide-free water* (solution A) gives the reactions of sodium salts and reaction A of citrates (2.3.1).

Tests

Appearance of solution. Solution A is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. Titrate 20 ml of solution A with *0.05 M sulphuric acid* or *0.1 M sodium hydroxide* using *thymol blue solution* as indicator; not more than 0.5 ml of *0.05 M sulphuric acid* or *0.1 M sodium hydroxide* is required.

Arsenic (2.3.10). Dissolve 5.0 g in 50 ml of *water* and add 15 ml of *stannated hydrochloric acid AsT*. The resulting solution complies with the limit test for arsenic (2 ppm).

Heavy metals (2.3.13). Dissolve 2.0 g in 10 ml of *water*, 5 ml of *dilute hydrochloric acid* and sufficient *water* to produce 25 ml. The solution complies with the limit test for heavy metals, Method A (10 ppm).

Chlorides (2.3.12). 25 ml of solution A complies with the limit test for chlorides (100 ppm).

Oxalate. Dissolve 0.5 g in 4 ml of *water*, add 3 ml of *hydrochloric acid* and 1 g of *zinc*, in granules, and heat on a water-bath for 1 minute. Allow to stand for 2 minutes, decant the liquid into a test-tube containing 0.25 ml of a 1 per cent w/v solution of *phenylhydrazine hydrochloride* and heat to boiling. Cool rapidly, transfer to a graduated cylinder and add an equal volume of *hydrochloric acid* and 0.25 ml of *potassium ferricyanide solution*. Shake and allow to stand for 30 minutes. Any pink colour produced is not more intense than that obtained by treating at the same time and in the same manner 4 ml of a 0.005 per cent w/v solution of *oxalic acid* (300 ppm, calculated as anhydrous oxalic acid).

Sulphates (2.3.17). To 10 ml of solution A add 2 ml of *7 M hydrochloric acid* and dilute to 15 ml with *distilled water*; the resulting solution complies with the limit test for sulphates (150 ppm).

Tartrates. To a solution of 1 g in 2 ml of *water* in a test-tube, add 1 ml of a 10 per cent w/v solution of *potassium acetate* and 1 ml of *6 M acetic acid*. Scratch the walls of the test-tube with a glass rod; no crystalline precipitate is formed.

Readily carbonisable substances. Heat 0.2 g, in powder, with 10 ml of *sulphuric acid (96 per cent w/w)* in a water-bath at 90° ± 1° for 1 hour and cool rapidly. The solution is not more intensely coloured than reference solution YS2 or GYS2 (2.4.1).

Water (2.3.43). 11.0 to 13.0 per cent, determined on 0.3 g and after stirring for 15 minutes before titrating.

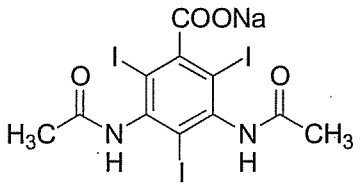
Assay. Weigh accurately about 0.15 g and dissolve in 20 ml of *anhydrous glacial acetic acid*, warming to about 50°. Allow to cool. Titrate with *0.1 M perchloric acid*, using 0.25 ml of *1-naphtholbenzein solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.008602 g of $C_6H_5Na_3O_7$.

Storage. Store protected from light.

Sodium Diatrizoate

Diatrizoate Sodium



$C_{11}H_8I_3N_2NaO_4$ Mol. Wt. 635.9

Sodium Diatrizoate is sodium 3,5-diacetamido-2,4,6-triiodobenzoate.

Sodium Diatrizoate contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{11}H_8I_3N_2NaO_4$, calculated on the anhydrous basis.

Category. Urographic radio-opaque substance.

Dose. To be decided by the physician in accordance with the needs of the patient.

Description. A white powder; odourless or almost odourless.

Identification

Tests A and D may be omitted if tests B, C, E and F are carried out. Tests B, C and F may be omitted if tests A, D and E are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sodium diatrizoate RS* or with the reference spectrum of sodium diatrizoate.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 20 volumes of *chloroform*, 10 volumes of *methanol* and 2 volumes of *strong ammonia solution*.

Test solution. Dissolve 0.1 g of the substance under examination in 100 ml of 0.08 per cent w/v solution of *sodium hydroxide* in *methanol*.

Reference solution. A 0.1 per cent w/v of *sodium diatrizoate RS* in 0.08 per cent w/v solution of *sodium hydroxide* in *methanol.*

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

C. Heat 0.5 g in a crucible; violet vapours of iodine are evolved.

D. To 20 mg add 5 ml of *1 M sodium hydroxide* and boil gently under a reflux condenser for 10 minutes. Cool, add 5 ml of *2 M hydrochloric acid* and cool in ice for 5 minutes. Add 4 ml of a 1 per cent w/v solution of *sodium nitrite*, cool in ice for 5 minutes, add 0.3 g of *sulphamic acid*, shake gently until effervescence ceases and add 2 ml of a 0.4 per cent w/v solution of *N-(1-naphthyl) ethylenediamine dihydrochloride*; an orange-red colour is produced.

E. Heat 0.5 g with 1 ml of *sulphuric acid* on a water-bath until a pale violet solution is produced, add 2 ml of *ethanol (95 per cent)* and heat again; odour of ethyl acetate is produced.

F. Gives the reactions of sodium salts (2.3.1).

Tests

pH (2.4.24). 7.5 to 9.5, determined in a 50 per cent w/v solution.

Free amine. Place 1.0 g in a 50-ml glass-stoppered volumetric flask, add 5 ml of *water*, 10 ml of *0.1 M sodium hydroxide* and 25 ml of *dimethyl sulphoxide*. Stopper the flask, mix the contents gently and cool in ice, protected from light. After 5 minutes, slowly add 2 ml of *hydrochloric acid*, mix and allow to stand for 5 minutes. Add 2 ml of a 2 per cent w/v solution of *sodium nitrite*, mix and allow to stand for 5 minutes. Add 1 ml of an 8 per cent w/v solution of *sulphamic acid*, mix and allow to stand for 5 minutes. Add 2 ml of a 0.1 per cent w/v solution of *N-(1-naphthyl)ethylenediamine dihydrochloride* in a 70 per cent w/v solution of *1,2-propanediol* and mix. Remove the flask from the ice and allow to stand in water at 25° ± 2° for 10 minutes, with occasional shaking. Add sufficient *dimethyl sulphoxide* to produce 50 ml and mix. Within 5 minutes, measure the absorbance of the resulting solution at the maximum at about 470 nm (2.4.7), using as the blank a solution prepared by treating 5 ml of *water* in the same manner; absorbance, not more than 0.40, calculated on the anhydrous basis.

Free iodine and iodide. Dissolve 2.0 g in 24 ml of *water* taken in a 50-ml glass-stoppered centrifuge tube. Add 5 ml of *toluene* and 5 ml of *1 M sulphuric acid*, shake well and centrifuge; no red colour appears in the toluene layer. To the mixture add 1 ml of a 2 per cent w/v solution of *sodium nitrite*, shake and centrifuge; any red colour in the toluene layer is not more intense than that produced in a solution prepared in the same manner using 2.0 ml of a 0.025 per cent w/v solution of *potassium iodide* and 22 ml of *water* (220 ppm).

Heavy metals. Dissolve 1.0 g in 20.0 ml of *water* and 5 ml of *1 M sodium hydroxide*, transfer the solution to a 50-ml Nessler cylinder, dilute with *water* to 40 ml and mix. Add 10 ml of *sodium sulphide solution*, shake and allow to stand for 5 minutes (20 ppm), the colour of the solution when viewed downward over a white surface is not more intense than that produced by treating 2.0 ml of *lead standard solution (10 ppm Pb)* in the same manner in place of the substance under examination.

Water (2.3.43). 4.0 to 7.0 per cent, determined on 0.4 g.

Assay. Weigh accurately about 0.4 g in a glass-stoppered conical flask, add 12 ml of *5 M sodium hydroxide* and 1 g of *zinc powder* and boil under a reflux condenser for 30 minutes. Cool, rinse the condenser with 30 ml of *water*, filter through cotton and wash the flask and filter with two quantities, each of 20 ml, of *water*. To the combined filtrate and washings add 80 ml of *hydrochloric acid*, cool and titrate with *0.05 M potassium iodate* until the dark brown colour becomes pale brown. Add 5 ml of *chloroform* and continue the titration, shaking well after each addition, until the chloroform becomes colourless.

1 ml of *0.05 M potassium iodate* is equivalent to 0.02120 g of $C_{11}H_8I_3N_2NaO_4$.

Storage. Store protected from light.

Sodium Diatrizoate Injection

Diatrizoate Sodium Injection

Sodium Diatrizoate Injection is a sterile solution of Sodium Diatrizoate in Water for Injections. It may contain small amounts of suitable buffers, stabilisers and antimicrobial agents but the preparation intended for intravenous administration contains no antimicrobial preservative.

Sodium Diatrizoate Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of sodium diatrizoate, $C_{11}H_8I_3N_2NaO_4$.

Usual strengths. 25 per cent w/v; 40 per cent w/v.

Identification

Evaporate a volume of the injection containing 1 g of Sodium Diatrizoate to dryness. The residue complies with following tests.

A. Heat 0.5 g of residue in a crucible; violet vapours of iodine are evolved.

B. To 20 mg of the residue add 5 ml of *1 M sodium hydroxide* and boil gently under a reflux condenser for 10 minutes. Cool,

add 5 ml of *2 M hydrochloric acid* and cool in ice for 5 minutes. Add 4 ml of a 1 per cent w/v solution of *sodium nitrite*, cool in ice for 5 minutes, add 0.3 g of *sulphamic acid*, shake gently until effervescence ceases and add 2 ml of a 0.4 per cent w/v solution of *N-(1-naphthyl) ethylenediamine dihydrochloride*; an orange-red colour is produced.

C. Heat 0.5 g of residue with 1 ml of *sulphuric acid* on a water-bath until a pale violet solution is produced, add 2 ml of *ethanol (95 per cent)* and heat again; odour of ethyl acetate is produced.

Tests

pH (2.4.24). 6.6 to 7.6.

Free amine. To a volume containing 1.0 g of Sodium Diatrizoate in a 50-ml glass-stoppered volumetric flask, add 5 ml of *water*, 10 ml of *0.1 M sodium hydroxide* and 25 ml of *dimethyl sulphoxide*. Stopper the flask, mix the contents gently and cool in ice, protected from light. After 5 minutes, slowly add 2 ml of *hydrochloric acid*, mix and allow to stand for 5 minutes. Add 2 ml of a 2 per cent w/v solution of *sodium nitrite*, mix and allow to stand for 5 minutes. Add 1 ml of an 8 per cent w/v solution of *sulphamic acid*, mix and allow to stand for 5 minutes. Add 2 ml of a 0.1 per cent w/v solution of *N-(1-naphthyl)ethylenediamine dihydrochloride* in a 70 per cent w/v solution of *1,2-propanediol* and mix. Remove the flask from the ice and allow to stand in water at 25° ± 2° for 10 minutes, with occasional shaking. Add sufficient *dimethyl sulphoxide* to produce 50 ml and mix. Within 5 minutes, measure the absorbance of the resulting solution at the maximum at about 470 nm (2.4.7), using as the blank a solution prepared by treating 5 ml of *water* in the same manner; absorbance, not more than 0.30, calculated on the anhydrous basis.

Free iodine and iodide. To a volume containing 2.0 g of Sodium Diatrizoate in 24 ml of *water* taken in a 50-ml glass-stoppered centrifuge tube add 5 ml of *toluene* and 5 ml of *1 M sulphuric acid*, shake well and centrifuge; no red colour appears in the toluene layer. To the mixture add 1 ml of a 2 per cent w/v solution of *sodium nitrite*, shake and centrifuge; any red colour in the toluene layer is not more intense than that produced in a solution prepared in the same manner using 2.0 ml of a 0.025 per cent w/v solution of *potassium iodide* and 22 ml of *water* (220 ppm).

Pyrogens (2.2.8). Complies with test for pyrogens, using per kg of the rabbit's weight a volume containing 2.5 g of Sodium Diatrizoate.

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. Weigh accurately about 0.5 g in a glass-stoppered conical flask, add 12 ml of *5 M sodium hydroxide* and 1 g of *zinc powder* and boil under a reflux condenser for 30 minutes. Cool, rinse the condenser with 30 ml of *water*, filter through cotton and wash the flask and filter with two quantities, each of 20 ml, of *water*. To the combined filtrate and washings add 80 ml of *hydrochloric acid*, cool and titrate with *0.05 M potassium iodate* until the dark brown colour becomes pale brown. Add 5 ml of *chloroform* and continue the titration, shaking well after each addition, until the chloroform becomes colourless.

1 ml of *0.05 M potassium iodate* is equivalent to 0.02120 g of $C_{11}H_8I_3N_2NaO_4$.

Storage. Store protected from light.

Labelling. The label states (1) the concentration of the active ingredient; (2) whether the contents are intended for intravenous injection and, if so, that the unused portion remaining in the container after use must be discarded.

Sodium Dihydrogen Phosphate Dihydrate

Sodium Acid Phosphate

$NaH_2PO_4,2H_2O$ Mol. Wt. 156.0

Sodium Dihydrogen Phosphate Dihydrate contains not less than 98.0 per cent and not more than 100.5 per cent of NaH_2PO_4, calculated on the dried basis.

Category. Urinary acidifier.

Dose. 2 to 4 g.

Description. Colourless crystals or a white powder; odourless.

Identification

A. Dissolve 10.0 g in sufficient *carbon dioxide-free water* to produce 100 ml (solution A). Solution A is faintly acid.

B. Solution A neutralised with a 10 per cent w/v solution of *potassium hydroxide* gives reaction A of sodium salts (2.3.1).

C. Solution A gives the reactions of phosphates (2.3.1).

Tests

Appearance of solution. Solution A is clear (2.4.1), and colourless (2.4.1).

pH (2.4.24). 4.2 to 4.5, determined in a mixture of 5 ml of solution A and 5 ml of *carbon dioxide-free water*.

Arsenic (2.3.10). Dissolve 0.5 g in 50 ml of *water* and add 10 ml of *stannated hydrochloric acid AsT*. The resulting solution complies with the limit test for arsenic (2 ppm).

Heavy metals (2.3.13). 12 ml of solution A complies with the limit test for heavy metals, Method D (10 ppm). Use *lead standard solution (1 ppm Pb)* to prepare the standard.

Iron (2.3.14). 20 ml of solution A complies with the limit test for iron (20 ppm).

Chlorides (2.3.12). 10 ml of solution A diluted to 20 ml with *water* complies with the limit test for chlorides (250 ppm)

Sulphates (2.3.17). To 5 ml of solution A add 0.5 ml of *hydrochloric acid* and dilute to 15 ml with distilled water; the solution complies with the limit test for sulphates (300 ppm).

Reducing substances. To 5 ml of solution A add 0.25 ml of *0.02 M potassium permanganate* and 5 ml of *1 M sulphuric acid* and heat in a water-bath for 5 minutes; the pink colour is not completely discharged.

Disodium phosphate. Dilute 10 ml of solution A to 50 ml with *water* and titrate with *0.05 M sulphuric acid* using *bromocresol green solution* as indicator; not more than 1 ml of *0.05 M sulphuric acid* is required.

Loss on drying (2.4.19). 21.5 to 24.0 per cent, determined on 0.25 g by drying in an oven at 130°.

Assay. Weigh accurately about 2.5 g, dissolve in 40 ml of *water* and titrate with carbonate-free *1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25).

1 ml of *1 M sodium hydroxide* is equivalent to 0.120 g of NaH_2PO_4.

Storage. Store protected from moisture.

Sodium Fluoride

NaF Mol. Wt. 42.0

Sodium Fluoride contains not less than 98.5 per cent and not more than 100.5 per cent of NaF, calculated on the dried basis.

Category. Preventive for dental caries.

Description. A white powder or colourless crystals.

Identification

A. Dissolve 2.5 g in sufficient *carbon dioxide-free water* without heating to produce 100 ml (solution A). To 2 ml of solution A add 0.5 ml of *calcium chloride solution*; a gelatinous white precipitate is produced which dissolves on adding 5 ml of *ferric chloride solution*.

B. Add about 4 mg to a mixture of 0.1 ml of *alizarin red S solution* and 0.1 ml of *zirconyl nitrate solution* and mix; the colour changes to yellow.

C. Gives reaction A of sodium salts (2.3.1).

Tests

Appearance of solution. Solution A is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. Dissolve 2.5 g of *potassium nitrate* in 40 ml of solution A, dilute to 50 ml with *carbon dioxide-free water*, cool to 0° and add 0.2 ml of *dilute phenolphthalein solution*. If the solution is colourless, not more than 1.0 ml of *0.1 M sodium hydroxide* is required to produce a red colour that persists for not less than 15 seconds. If the solution is red, not more than 0.25 ml of *0.1 M hydrochloric acid* is required to change the colour of the solution. Reserve the neutralised solution for the test for Fluorosilicate.

Chlorides (2.3.12). 40 ml of solution A complies with the limit test for chlorides (250 ppm).

Fluorosilicate. Heat to boiling the solution reserved in the test for Acidity or alkalinity and titrate while hot with *0.1 M sodium hydroxide* until a red colour is produced. Not more than 1.5 ml of *0.1 M sodium hydroxide* is required.

Sulphates (2.3.17). Dissolve 0.25 g in 10 ml of a saturated solution of *boric acid* in *distilled water* and add 5 ml of *distilled water* and 0.6 ml of *7 M hydrochloric acid*. The solution complies with the limit test for sulphates (200 ppm). Prepare the standard by mixing together 0.6 ml of *7 M hydrochloric acid*, 5 ml of *sulphate standard solution (10 ppm SO_4)* and 10 ml of a saturated solution of *boric acid* in *distilled water*.

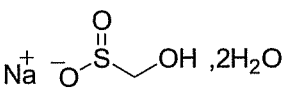
Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 130° for 3 hours.

Assay. Weigh accurately about 80 mg, add a mixture of 5 ml of *acetic anhydride* and 20 ml of *anhydrous glacial acetic acid* and heat to dissolve. Cool, add 20 ml of *dioxan*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator, until a green colour is produced. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.004199 g of NaF.

Storage. Store protected from moisture.

Sodium Formaldehyde Sulphoxylate



$CH_3NaO_3S,2H_2O$ Mol Wt. 154.1

Sodium Formaldehyde Sulphoxylate is monosodium hydroxymethane sulphinate dihydrate. It may contain a suitable stabilising agent such as sodium carbonate.

Sodium Formaldehyde Sulphoxylate contains an amount of CH_3NaO_3S equivalent to not less than 45.0 per cent and

not more than 55.0 per cent of SO_2, calculated on the dried basis.

Category. Pharmaceutical aid (antioxidant).

Description. White crystals or hard white masses; odour, characteristic and garlic-like.

Identification

A. Dissolve about 4 g in 10 ml of *water* in a test-tube and add 1 ml of *ammoniacal silver nitrate solution*; metallic silver is produced either as a finely divided grey precipitate or as a bright metallic mirror on the inner surface of the tube.

B. Add about 50 mg to a solution of 40 mg of *salicylic acid* in 5 ml of *sulphuric acid* and warm very gently; a permanent deep red colour develops.

Tests

Appearance of solution. A 5.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and colourless (2.4.1).

Alkalinity. Dissolve 1.0 g in 50 ml of *water* and add 0.15 ml of *dilute phenolphthalein solution*; not more than 3.5 ml of *0.05 M sulphuric acid* is required to change the colour of the solution.

pH (2.4.24). 9.5 to 10.5, determined in a 2.0 per cent w/v solution in *carbon dioxide-free water*.

Iron (2.3.14). Ignite 1.0 g, initially at a low temperature until thoroughly charred and finally at about 600°, preferably in a muffle furnace, until all the carbon has been burnt off. Cool, dissolve the residue in 2 ml of *hydrochloric acid* and dilute to 50 ml with *water*. Add about 50 mg of *ammonium persulphate* and 5 ml of *ammonium thiocyanate solution*, mix and transfer to a Nessler cylinder. The red colour of the solution is not more intense than that of 1.0 ml of *iron standard solution (10 ppm)* treated in the same manner.

Sulphides. Dissolve 6 g in 14 ml of *water* in a test-tube and wet a strip of *lead acetate paper* in the clear solution; no discolouration is evident within 5 minutes.

Sodium sulphite. Not more than 5.0 per cent, calculated as Na_2SO_3, determined by the following method. Transfer 4.0 ml of the solution obtained in the Assay to a flask, add 2 ml of *formaldehyde solution* and titrate with *0.1 M iodine* that is used for the Assay, adding *starch solution* towards the end of the titration as indicator.

Calculate the percentage of Na_2SO_3 from the expression $78.775(V_2-V_1)/W$,

where V_1 and V_2 are the volumes, in ml, of *0.1 M iodine* consumed in this test and in the Assay respectively and W is the weight, in g, of the substance under examination taken for the Assay.

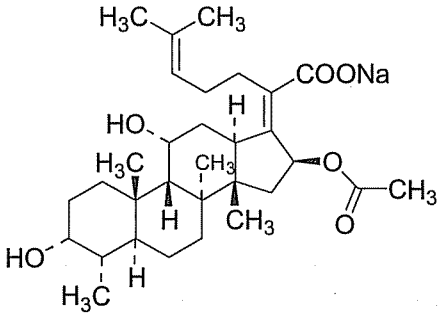
Loss on drying (2.4.19). Not more than 27.0 per cent, determined on 0.5 g by drying in an oven at 105° for 3 hours.

Assay. Weigh accurately about 1.0 g, dissolve in 25 ml of *water*, add sufficient *water* to produce 50.0 ml and mix. To 4.0 ml of this solution add 100 ml of *water* and titrate with *0.1 M iodine* using 3 ml of *starch solution*, added towards the end of the titration, as indicator.

1 ml of *0.1 M iodine* is equivalent to 0.001602 g of SO_2.

Storage. Store protected from light and moisture.

Sodium Fusidate



$C_{31}H_{47}NaO_6$ Mol. Wt. 538.7

Sodium Fusidate is sodium (17*Z*)-16β-acetoxy-3α,11α-dihydroxyfusida-17(20),24-diene-21-oate, produced by the growth of certain strains of *Fusidium coccineum* or by any other means.

Sodium Fusidate contains not less than 97.5 per cent and not more than 101.0 per cent of $C_{31}H_{47}NaO_6$, calculated on the anhydrous basis.

Category. Antibacterial.

Dose. 1.5 g daily, in divided doses.

Description. A white or almost white, crystalline powder; slightly hygroscopic.

Identification

A. Dissolve 0.1 g in 5 ml of *water*, add 5 ml of *chloroform* and 0.1 ml of a 10 per cent w/w solution of *phosphoric acid*, shake vigorously for 1 minute, allow to separate and filter the lower layer through absorbent cotton covered with *anhydrous sodium sulphate*. Repeat the extraction with two quantities, each of 5 ml, of *chloroform*, evaporate the combined extracts at a pressure of 2 kPa, dry the residue over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa for 2 hours and dissolve in 1 ml of *chloroform IR*.

On the residue determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that

obtained with *fusidic acid RS* or with the reference spectrum of fusidic acid.

B. In the test for Related substances, the principal spot in the chromatogram obtained with the test solution (b) corresponds to that in the chromatogram obtained with reference solution (a).

C. Ignite 1 g. The residue gives the reactions of sodium salts (2.3.1).

Tests

Appearance of solution. A 15.0 per cent w/v solution in *carbon dioxide-free water* is not more intensely coloured than reference solution BS6 (2.4.1).

pH (2.4.24). 7.5 to 9.0, determined in a 1.25 per cent w/v solution.

Specific optical rotation (2.4.22). +5.0° to +8.0°, determined at 20° by dissolving 1.5 g in 25 ml of *water*, adding 0.1 ml of *5 M ammonia* and diluting to 50 ml with *water*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 10.0 ml of the mobile phase.

Reference solution (a). Dissolve 5 mg of *3-ketofusidic acid RS* in 5 ml of the mobile phase. To 1.0 ml of this solution add 0.2 ml of the test solution and dilute to 20.0 ml with the mobile phase.

Reference solution (b). Dilute 20 µl of the test solution to 100.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 12.5 cm x 5 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 10 volumes of *methanol*, 20 volumes of 1.0 per cent w/v solution of *orthophosphoric acid*, 20 volumes of *water* and 50 volumes of *acetonitrile*,
- flow rate. 2 ml per minute,
- spectrophotometer set at 235 nm,
- injection volume. 20 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to 3-ketofusidic acid and sodium fusidate is not less than 2.5.

Inject the test solution, reference solution (a) and (b). The signal-to-noise ratio of the principal peak is not less than 3. Run the chromatogram 3.5 times the retention time of principal peak. The sum of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (4.0 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.02 per cent).

Water (2.3.43). Not more than 2.0 per cent, determined on 0.5 g.

Assay. Weigh accurately about 0.2 g and dissolve in a mixture of 15 ml of *water* and 20 ml of *ethanol (95 per cent)*. Titrate with *0.1 M hydrochloric acid* to pH 4.1, stirring continuously, determining the end-point potentiometrically (2.4.25).

1 ml of *0.1 M hydrochloric acid* is equivalent to 0.05387 g of $C_{31}H_{47}NaO_6$.

Storage. Store protected from light and moisture.

Sodium Hydroxide

Caustic Soda

NaOH Mol. Wt. 40.0

Sodium Hydroxide contains not less than 97.0 per cent and not more than 100.5 per cent of total alkali, calculated as NaOH.

Category. Pharmaceutical aid (alkalising agent).

Description. White, crystalline masses supplied as sticks, pellets or slabs; deliquescent. Readily absorbs carbon dioxide.

CAUTION — Great care should be exercised in handling Sodium Hydroxide as it rapidly destroys tissues.

Identification

A. Carefully dissolve 5.0 g in 12 ml of *distilled water*, add 17 ml of *7 M hydrochloric acid*, adjust the pH to 7.0 with *1 M hydrochloric acid* and add sufficient *distilled water* to produce 50 ml (solution A). 2 ml of solution A gives reaction A of sodium salts (2.3.1).

B. pH of a 0.01 per cent w/v solution, not less than 11.0 (2.4.24).

Tests

Appearance of solution. A 10.0 per cent w/v solution is clear (2.4.1), and colourless (2.4.1).

Arsenic (2.3.10). Dissolve 2.5 g in 50 ml of *water*, add 16 ml of *brominated hydrochloric acid AsT*, and remove the excess of bromine with a few drops of *stannous* chloride *solution AsT*. The resulting solution complies with the limit test for arsenic (4 ppm).

Heavy metals (2.3.13). Dissolve 1.0 g in 5 ml of *water* and 10 ml of *3 M hydrochloric acid*, heat to boiling, cool and dilute to 25 ml with *water*. The solution complies with the limit test for heavy metals, Method A (20 ppm).

Iron (2.3.14). 20 ml of solution A complies with the limit test for iron (20 ppm).

Carbonates. Not more than 2.0 per cent, calculated as Na_2CO_3, determined in the Assay.

Chlorides (2.3.12). Dissolve 2.0 g in 5 ml of *water*, acidify with about 8 ml of *nitric acid* and dilute to 20 ml with *water*. The solution, without the addition of *dilute nitric acid*, complies with the limit test for chlorides (125 ppm).

Sulphates (2.3.17). Dissolve 2.0 g in 6 ml of *distilled water*, adjust the pH to 7 with *hydrochloric acid* and dilute to 20 ml with *distilled water*. The resulting solution complies with the limit test for sulphates (75 ppm).

Potassium. Acidify 2.5 ml of solution A with *acetic acid* and add 0.15 ml of *sodium cobaltinitrite solution*; no precipitate is formed.

Assay. Weigh accurately about 2.0 g, dissolve in about 80 ml of *carbon dioxide-free water*, add 0.3 ml of *phenolphthalein solution* and titrate with *1 M hydrochloric acid*. Add 0.3 ml of *methyl orange solution* and continue the titration with *1 M hydrochloric acid*.

1 ml of *1 M hydrochloric acid* used in the second part of the titration is equivalent to 0.1060 g of Na_2CO_3.

1 ml of *1 M hydrochloric acid* used in the combined titrations is equivalent to 0.0400 g of total alkali, calculated as NaOH.

Storage. Store protected from moisture, in non-metallic containers.

Sodium Lactate Injection

Sodium Lactate Intravenous Infusion

Sodium Lactate Injection is a sterile solution containing 1.85 per cent w/v of sodium lactate in Water for Injections. It is prepared from Lactic Acid with the aid of Sodium Hydroxide and sufficient Dilute Hydrochloric Acid to adjust the pH of the solution.

Sodium Lactate Injection contains not less than 1.75 per cent and not more than 1.95 per cent w/v of sodium lactate, $C_3H_5NaO_3$.

Category. Fluid and electrolyte replenisher.

Dose. By intravenous infusion at the rate of 5 ml or less per minute.

Description. A clear, colourless solution.

Identification

A. When warmed with *potassium permanganate*, gives acetaldehyde, recognisable by its odour.

B. The residue on evaporation, when moistened with *hydrochloric acid* and introduced on a platinum wire into a flame, imparts a yellow colour to the flame.

C. Carry out reaction C of calcium salts (2.3.1); no white precipitate is produced.

Tests

pH (2.4.24). 5.0 to 7.0.

Bacterial endotoxins (2.2.3). Not more than 2.0 Endotoxin Units per millimole.

Other tests. Complies with the tests stated under Parenteral Preparations (Intravenous Infusions).

Assay. Measure accurately 10 ml, evaporate to dryness in a platinum dish and ignite very gently until completely carbonised. Boil the residue with 25.0 ml of *0.05 M sulphuric acid*, filter and wash thoroughly with hot *water*. Titrate the excess of acid in the combined filtrate and washings with *0.1 M sodium hydroxide* using *methyl orange solution* as indicator.

1 ml of *0.05 M sulphuric acid* is equivalent to 0.01121 g of $C_3H_5NaO_3$.

Storage. Store in single dose containers of glass or plastic. On keeping, small solid particles may separate from the solution in glass containers.

Labelling. The label states (1) that the Injection is one-sixth molar and contains, in one litre, approximately 167 millimoles each of sodium ions and of bicarbonate ions (as lactate); (2) that the injection should not be used if the solution contains visible solid particles.

Compound Sodium Lactate and Dextrose Injection

Compound Sodium Lactate with Dextrose Intravenous Infusion; Ringer-Lactate Solution with Dextrose for Injection; Hartmann's Solution with Dextrose for Injection.

Compound Sodium Lactate and Dextrose Injection is a sterile solution containing 0.24 per cent v/v of Lactic Acid (equivalent to 0.32 per cent w/v of sodium lactate) with 0.6 per cent w/v of Sodium Chloride, 0.04 per cent w/v of Potassium Chloride, 0.027 per cent w/v of Calcium Chloride and 5 per cent w/v of Dextrose in Water for Injections.

Compound Sodium Lactate and Dextrose Injection contains not less than 0.27 per cent and not more than 0.32 per cent w/v of sodium, Na, not less than 0.019 per cent and not more than 0.022 per cent w/v of potassium, K, not less than 0.37 per cent and not more than 0.42 per cent w/v of total chloride, Cl, not less than 0.025 per cent and not more than 0.029 per cent w/v of calcium chloride, $CaCl_2,2H_2O$, and not less than

0.23 per cent and not more than 0.28 per cent w/v of lactate, calculated as $C_3H_6O_3$, and not less than 4.50 per cent and not more than 5.25 per cent w/v of dextrose, $C_6H_{12}O_6$. It contains no antimicrobial agent.

Category. Fluid and electrolyte replenisher.

Description. A clear, colourless or faintly straw-coloured solution.

Identification

A. To 1 ml add 0.05 ml of *potassium cupri-tartrate solution*; the solution remains blue and clear. Heat to boiling, a copious red precipitate is formed.

B. When warmed with *potassium permanganate* gives acetaldehyde, recognisable by its odour.

C. The residue on evaporation, when moistened with *hydrochloric acid* and introduced on a platinum wire into a flame imparts a yellow colour to the flame. When viewed through a suitable blue glass, the flame is tinged reddish purple.

D. Gives reaction C of calcium salts and reaction A of chlorides (2.3.1).

Tests

pH (2.4.24). 4.0 to 6.5.

5-Hydroxymethylfurfural and Related substances. Dilute a volume containing 1.0 g of Dextrose to 500.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 284 nm; absorbance at about 284 nm, not more than 0.25 (2.4.7).

Heavy metals (2.3.13). Evaporate a volume containing 4 g of dextrose to 10 ml and add 2 ml of *dilute acetic acid* and sufficient *water* to produce 25 ml. The solution complies with the limit test for heavy metals, Method A (5 ppm).

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. *For sodium* — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 589 nm and using *sodium solution FP* or *sodium solution AAS* respectively, suitably diluted with water for the standard solutions.

For potassium — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 767 nm and using *potassium solution FP* or *potassium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For total chlorides — To 20.0 ml add 30 ml of *water*, 50.0 ml of *0.1 M silver nitrate* and 2 ml of *nitric acid*. Filter, wash the precipitate with *water* slightly acidified with *nitric acid* and titrate the excess of silver nitrate with *0.1 M ammonium thiocyanate* using *ferric ammonium sulphate solution* as indicator until a reddish yellow colour is produced. Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of total chloride, calculated as Cl.

For calcium chloride — To 50.0 ml add 5.0 ml of *0.01 M magnesium sulphate* and 5 ml of *ammonia buffer pH 10.9* and titrate with *0.01 M disodium edetate* using *eriochrome black T mixture* as indicator. From the volume of *0.01 M disodium edetate* required subtract the volume of *0.01 M magnesium sulphate* added.

1 ml of the remainder of *0.01 M disodium edetate* is equivalent to 0.00147 g of $CaCl_2, 2H_2O$.

For lactate — Determine by liquid chromatography (2.4.14).

Test solution. The preparation under examination.

Reference solution. A 0.28 per cent w/v solution of *lithium lactate RS* in the mobile phase.

Chromatographic system
- a stainless steel column 20 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 90 volumes of *water* and 10 volumes of a 2 per cent v/v solution of *octylamine* in *acetonitrile*, the pH of which is adjusted to 7.0 with a 10 per cent v/v solution of *phosphoric acid,*
- flow rate. 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume. 10 µl.

Inject separately the test solution and the reference solution and measure the responses for the major peak.

Calculate the content of $C_3H_6O_3$, in the injection.

For dextrose — To an accurately measured volume containing 2 g to 5 g of Dextrose, add 0.2 ml of *5 M ammonia* and sufficient *water* to produce 100.0 ml. Mix well, allow to stand for 30 minutes and measure the optical rotation in a 2-dm tube (2.4.22). The observed rotation in degrees multiplied by 0.9477 represents the weight, in g, of dextrose, $C_6H_{12}O_6$, in the volume taken for assay.

Storage. Store in single dose containers of glass or plastic at a temperature not exceeding 30°. On keeping, small particles may separate from the solution in glass containers.

Labelling. The label states (1) that the injection contains, in millimoles per litre, the following approximate amounts of the

ions. sodium, 131, potassium, 5, calcium, 2; bicarbonate (as lactate), 29 and Chloride, 111; (2) the total osmolar concentration in mOsmol per litre; (3) that the injection should not be used if it contains visible particles.

Half Strength Compound Sodium Lactate and Dextrose Injection

Half Strength Compound Sodium Lactate with Dextrose Intravenous Infusion; Half Strength Ringer-Lactate Solution with Dextrose Injection

Half Strength Compound Sodium Lactate and Dextrose Injection is a sterile solution containing 0.12 per cent v/v of Lactic Acid (equivalent to 0.16 per cent w/v of sodium lactate) with 0.3 per cent w/v of Sodium Chloride, 0.02 per cent w/v of Potassium Chloride, 0.0135 per cent w/v of Calcium Chloride and 5 per cent w/v of Dextrose in Water for Injections.

Compound Sodium Lactate and Dextrose Injection contains not less than 0.135 per cent and not more than 0.16 per cent w/v of sodium, Na, not less than 0.0095 per cent and not more than 0.011 per cent w/v of potassium, K, not less than 0.185 per cent and not more than 0.210 per cent w/v of total chloride, Cl, not less than 0.0125 per cent and not more than 0.0145 per cent w/v of calcium chloride, $CaCl_2,2H_2O$, and not less than 0.115 per cent and not more than 0.140 per cent w/v of lactate, calculated as $C_3H_6O_3$, and not less than 4.5 per cent and not more than 5.25 per cent w/v of dextrose, $C_6H_{12}O_6$. It contains no antimicrobial agent.

Category. Fluid and electrolyte replenisher.

Description. A clear, colourless or faintly straw-coloured solution.

Identification

A. To 1 ml add 0.05 ml of *potassium cupri-tartrate solution*; the solution remains blue and clear. Heat to boiling, a copious red precipitate is formed.

B. When warmed with *potassium permanganate* gives acetaldehyde, recognisable by its odour.

C. The residue on evaporation, when moistened with *hydrochloric acid* and introduced on a platinum wire into a flame imparts a yellow colour to the flame. When viewed through a suitable blue glass, the flame is tinged reddish purple.

D. Gives reaction C of calcium salts and reaction A of chlorides (2.3.1).

Tests

pH (2.4.24). 4.0 to 6.5.

5-Hydroxymethylfurfural and Related substances. Dilute a volume containing 1.0 g of Dextrose to 500.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 284 nm; absorbance at about 284 nm, not more than 0.25 (2.4.7).

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. *For sodium* — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 589 nm and using *sodium solution FP* or *sodium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For potassium — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 767 nm and using *potassium solution FP* or *potassium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For total chlorides — To 20.0 ml add 30 ml of *water*, 50.0 ml of *0.1 M silver nitrate* and 2 ml of *nitric acid*. Filter, wash the precipitate with *water* slightly acidified with *nitric acid* and titrate the excess of silver nitrate with *0.1 M ammonium thiocyanate* using *ferric ammonium sulphate solution* as indicator until a reddish yellow colour is produced. Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of total chloride, calculated as Cl.

For calcium chloride — To 50.0 ml add 5.0 ml of *0.01 M magnesium sulphate* and 5 ml of *ammonia buffer pH 10.9* and titrate with *0.01 M disodium edetate* using *eriochrome black T mixture* as indicator. From the volume of *0.01 M disodium edetate* required subtract the volume of *0.01 M magnesium sulphate* added.

1 ml of the remainder of *0.01 M disodium edetate* is equivalent to 0.00147 g of $CaCl_2, 2H_2O$.

For lactate — Determine by liquid chromatography (2.4.14).

Test solution. The preparation under examination.

Reference solution. A 0.28 per cent w/v solution of *lithium lactate RS* in the mobile phase.

Chromatographic system
- a stainless steel column 20 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 90 volumes of *water* and 10 volumes of a 2 per cent v/v solution of *octylamine* in

acetonitrile, the pH of which is adjusted to 7.0 with a 10 per cent v/v solution of *phosphoric acid,*
- flow rate. 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume. 10 µl.

Inject separately the test solution and the reference solution and measure the responses for the major peak.

Calculate the content of $C_3H_6O_3$ in the injection.

For dextrose — To an accurately measured volume containing 2 g to 5 g of Dextrose, add 0.2 ml of *5 M ammonia* and sufficient *water* to produce 100.0 ml. Mix well, allow to stand for 30 minutes and measure the optical rotation in a 2-dm tube (2.4.22). The observed rotation in degrees multiplied by 0.9477 represents the weight, in g, of dextrose, $C_6H_{12}O_6$, in the volume taken for assay.

Storage. Store in single dose containers of glass or plastic at a temperature not exceeding 30°. On keeping, small particles may separate from the solution in glass containers.

Labelling. The label states (1) that the injection contains, in millimoles per litre, the following approximate amounts of the ions. sodium, 65.5, potassium, 2.5, calcium, 1, bicarbonate (as lactate), 14.5, and chloride, 55.5; (2) the total osmolar concentration in mOsmol per litre; (3) that the injection should not be used if it contains visible particles.

Modified Compound Sodium Lactate and Dextrose Injection

Modified Compound Sodium Lactate with Dextrose Intravenous Infusion; Modified Lactated Ringer's and Dextrose Injection.

Modified Compound Sodium Lactate and Dextrose Injection is a sterile solution containing 0.048 per cent v/v of Lactic Acid (equivalent to 0.064 per cent w/v of sodium lactate) with 0.12 per cent w/v of Sodium Chloride, 0.008 per cent w/v of Potassium Chloride, 0.0054 per cent w/v of Calcium Chloride and 5 per cent w/v of Dextrose in Water for Injections.

Modified Compound Sodium Lactate and Dextrose Injection contains not less than 0.054 per cent and not more than 0.064 per cent w/v of sodium, Na, not less than 0.0038 per cent and not more than 0.0044 per cent w/v of potassium, K, not less than 0.074 per cent and not more than 0.084 per cent w/v of total chloride, Cl, not less than 0.005 per cent and not more than 0.0058 per cent w/v of calcium chloride, $CaCl_2,2H_2O$, and not less than 0.046 per cent and not more than 0.056 per cent w/v of lactate, calculated as $C_3H_6O_3$, and not less than 4.5 per cent and not more than 5.25 per cent w/v of dextrose, $C_6H_{12}O_6$. It contains no antimicrobial agent.

Category. Fluid and electrolyte replenisher.

Description. A clear, colourless or faintly straw-coloured solution.

Identification

A. To 1 ml add 0.05 ml of *potassium cupri-tartrate solution*; the solution remains blue and clear. Heat to boiling, a copious red precipitate is formed.

B. When warmed with *potassium permanganate* gives acetaldehyde, recognisable by its odour.

C. The residue on evaporation, when moistened with hydrochloric acid and introduced on a platinum wire into a flame imparts a yellow colour to the flame. When viewed through a suitable blue glass, the flame is tinged reddish purple.

D. Gives reaction C of calcium salts and reaction A of chlorides (2.3.1).

Tests

pH (2.4.24). 4.0 to 6.5.

5-Hydroxymethylfurfural and Related substances. Dilute a volume containing 1.0 g of Dextrose to 500.0 ml with *water* and measure the absorbance of the resulting solution at the maximum at about 284 nm; absorbance at about 284 nm (2.4.7), not more than 0.25.

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. *For sodium* — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 589 nm and using *sodium solution FP* or *sodium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For potassium — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 767 nm and using *potassium solution FP* or *potassium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For total chlorides — To 20.0 ml add 30 ml of *water*, 50.0 ml of *0.1 M silver nitrate* and 2 ml of *nitric acid*. Filter, wash the precipitate with *water* slightly acidified with *nitric acid* and titrate the excess of silver nitrate with *0.1 M ammonium thiocyanate* using *ferric ammonium sulphate solution* as

indicator until a reddish yellow colour is produced. Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of total chloride, calculated as Cl.

For calcium chloride — Evaporate 100.0 ml on a water-bath to 50 ml, add to this solution 5.0 ml of *0.01 M magnesium sulphate* and 5 ml of *ammonia buffer pH 10.9* and titrate with *0.01 M disodium edetate* using *eriochrome black T mixture* as indicator. From the volume of *0.01 M disodium edetate* required subtract the volume of *0.01 M magnesium sulphate* added.

1 ml of the remainder of *0.01 M disodium edetate* is equivalent to 0.00147 g of $CaCl_2, 2H_2O$.

For lactate — Determine by liquid chromatography (2.4.14).

Test solution. The preparation under examination.

Reference solution. A 0.28 per cent w/v solution of *lithium lactate RS* in the mobile phase.

Chromatographic system
- a stainless steel column 20 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 90 volumes of *water* and 10 volumes of a 2 per cent v/v solution of *octylamine* in *acetonitrile*, the pH of which is adjusted to 7.0 with a 10 per cent v/v solution of *phosphoric acid,*
- flow rate. 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume. 10 µl.

Inject separately the test solution and the reference solution and measure the responses for the major peak.

Calculate the content of $C_3H_6O_3$ in the injection.

For dextrose — To an accurately measured volume containing 2 g to 5 g of Dextrose, add 0.2 ml of *5 M ammonia* and sufficient *water* to produce 100.0 ml. Mix well, allow to stand for 30 minutes and determine the optical rotation in a 2-dm tube (2.4.22). The observed rotation in degrees multiplied by 0.9477 represents the weight, in g, of dextrose, $C_6H_{12}O_6$, in the volume taken for assay.

Storage. Store in single dose containers of glass or plastic at a temperature not exceeding 30°. On keeping, small particles may separate from the solution in glass containers.

Labelling. The label states (1) that the injection contains, in millimoles per litre, the following approximate amounts of the ions. sodium, 26.2, potassium, 1, calcium, 0.4, bicarbonate (as lactate), 5.8, and chloride, 22.2; (2) the total osmolar concentration in mOsmol per litre; (3) that the injection should not be used if it contains visible particles.

Compound Sodium Lactate Injection

Compound Sodium Lactate Intravenous Infusion; Ringer-Lactate Solution for Injection; Hartmann's Solution for Injection

Compound Sodium Lactate Injection is a sterile solution containing 0.24 per cent v/v of Lactic Acid (equivalent to 0.32 per cent w/v of sodium lactate) with 0.6 per cent w/v of Sodium Chloride, 0.04 per cent w/v of Potassium Chloride and 0.027 per cent w/v of Calcium Chloride in Water for Injections.

Compound Sodium Lactate Injection contains not less than 0.27 per cent and not more than 0.32 per cent w/v of sodium, Na, not less than 0.019 per cent and not more than 0.022 per cent w/v of potassium, K, not less than 0.37 per cent and not more than 0.42 per cent w/v of total chloride, Cl, not less than 0.025 per cent and not more than 0.029 per cent w/v of calcium chloride, $CaCl_2,2H_2O$, and not less than 0.23 per cent and not more than 0.28 per cent w/v of lactate, calculated as $C_3H_6O_3$.

Category. Fluid and electrolyte replenisher.

Description. A clear, colourless solution.

Identification

A. When warmed with potassium permanganate gives acetaldehyde, recognisable by its odour.

B. The residue on evaporation, when moistened with hydrochloric acid and introduced on a platinum wire into a flame, imparts a yellow colour to the flame. When viewed through a suitable blue glass, the flame is tinged with reddish purple.

C. Gives reaction C of calcium salts (2.3.1).

Tests

pH (2.4.24). 5.0 to 7.0.

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Complies with the tests stated under Parenteral Preparations (Intravenous Infusions).

Assay. *For sodium* — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by atomic absorption spectrophotometry (2.4.2), measuring at 589 nm and using *sodium solution FP* or *sodium solution AAS*, suitably diluted for the standard solutions.

For potassium — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by atomic absorption spectrophotometry (2.4.2), measuring at 767 nm and using *potassium solution FP* or *potassium solution AAS,* suitably diluted for the standard solutions.

For total chlorides — To 20 ml add 30 ml of *water*, 50.0 ml of *0.1 M silver nitrate* and 2 ml of nitric acid, filter, wash the precipitate with water slightly acidified with nitric acid and titrate the excess of silver nitrate with *0.1 M ammonium thiocyanate* using ferric ammonium sulphate solution as indicator. Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of total chloride, calculated as Cl.

For calcium chloride — To 50 ml add 5.0 ml of *0.01 M magnesium sulphate* and 5 ml of *ammonia buffer pH 10.9* and titrate with *0.01 M disodium edetate* using *mordant black 11 mixture* as indicator. From the volume of *0.01 M disodium edetate* required subtract the volume of *0.01 M magnesium sulphate* added.

1 ml of the remainder of *0.01 M disodium edetate* is equivalent to 0.00147 g of $CaCl_2, 2H_2O$.

For lactate, calculated as $C_3H_6O_3$ — Evaporate 50 ml to dryness in a platinum dish and ignite very gently until completely carbonised. Boil the residue with 25.0 ml of *0.05 M sulphuric acid*, filter, and wash thoroughly with hot *water*. Titrate the excess of acid in the combined filtrate and washings with *0.1 M sodium hydroxide* using *methyl orange solution* as indicator.

1 ml of *0.05 M sulphuric acid* is equivalent to 0.009008 g of $C_3H_6O_3$.

Storage. Store in single dose containers of glass or plastic. On keeping, small solid particles may separate from the solution in glass containers.

Labelling. The label states (1) that the injection contains, in millimoles per litre, the following approximate amounts of the ions. sodium, 131, potassium, 5, calcium, 2, bicarbonate (as lactate), 29 and chloride, 111; (2) that the injection should not be used if the solution contains visible solid particles.

Compound Sodium Lactate Solution for Irrigation

Ringer-Lactate Solution for Irrigation; Hartmann's Solution for Irrigation

Compound Sodium Lactate Solution for Irrigation is a sterile solution containing 0.24 per cent v/v of Lactic Acid (equivalent to 0.32 per cent w/v of sodium lactate) with 0.6 per cent w/v of Sodium Chloride, 0.04 per cent w/v of Potassium Chloride and 0.027 per cent w/v of Calcium Chloride in Water for Injections.

Compound Sodium Lactate Solution for Irrigation contains not less than 0.27 per cent and not more than 0.32 per cent w/v of sodium, Na, not less than 0.019 per cent and not more than 0.022 per cent w/v of potassium, K, not less than 0.37 per cent and not more than 0.42 per cent w/v of total chloride, Cl, not less than 0.025 per cent and not more than 0.029 per cent w/v of calcium chloride, $CaCl_2,2H_2O$, and not less than 0.23 per cent and not more than 0.28 per cent w/v of lactate, calculated as $C_3H_6O_3$. It contains no antimicrobial agent.

Category. Irrigation fluid.

Description. A clear, colourless solution.

Identification

A. When warmed with *potassium permanganate* gives acetaldehyde, recognisable by its odour.

B. The residue on evaporation, when moistened with *hydrochloric acid* and introduced on a platinum wire into a flame imparts a yellow colour to the flame. When viewed through a suitable blue glass, the flame is tinged reddish purple.

C. Gives reaction C of calcium salts and reaction A of chlorides (2.3.1).

Tests

pH (2.4.24). 5.0 to 7.0.

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per ml.

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. *For sodium* — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 589 nm and using *sodium solution FP* or *sodium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For potassium — Dilute suitably with *water* and determine by Method A for flame photometry (2.4.4), or by Method A for atomic absorption spectrophotometry (2.4.2), measuring at 767 nm and using *potassium solution FP* or *potassium solution AAS* respectively, suitably diluted with *water* for the standard solutions.

For calcium chloride — To 50.0 ml add 5.0 ml of *0.01 M magnesium sulphate* and 5 ml of *ammonia buffer pH 10.9* and titrate with *0.01 M disodium edetate* using *eriochrome black T mixture* as indicator. From the volume of *0.01 M disodium edetate* required subtract the volume of *0.01 M magnesium sulphate* added.

1 ml of the remainder of *0.01 M disodium edetate* is equivalent to 0.00147 g of $CaCl_2, 2H_2O$.

For total chlorides — To 20.0 ml add 30 ml of *water*, 50.0 ml of *0.1 M silver nitrate* and 2 ml of *nitric acid*. Filter, wash the

precipitate with *water* slightly acidified with *nitric acid* and titrate the excess of silver nitrate with *0.1 M ammonium thiocyanate* using *ferric ammonium sulphate solution* as indicator until a reddish yellow colour is produced. Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.003545 g of total chloride, calculated as Cl.

For lactate — Determine by liquid chromatography (2.4.14).

Test solution. The preparation under examination.

Reference solution. A 0.28 per cent w/v solution of *lithium lactate RS* in the mobile phase.

Chromatographic system
- a stainless steel column 20 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 90 volumes of *water* and 10 volumes of a 2 per cent v/v solution of *octylamine* in *acetonitrile*, the pH of which is adjusted to 7.0 with a 10 per cent v/v solution of *phosphoric acid,*
- flow rate. 2 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume. 10 µl.

Inject separately the test solution and the reference solution and measure the responses for the major peak.

Calculate the content of $C_3H_6O_3$, in the injection.

Storage. Store in single dose containers of glass or plastic. On keeping, small solid particles may separate from the solution in glass containers. The container may be designed to empty rapidly and may contain a volume of more than one litre.

Labelling. The label states (1) that the irrigation solution contains, in millimoles per litre, the following approximate amounts of the ions. sodium,131, potassium, 5, calcium, 2, bicarbonate (as lactate), 29, and chloride, 111; (2) that the solution should not be used if it contains visible particles; (3) 'For irrigation only' and 'Not for injection'; (4) that once the container is opened, the unused portion should be discarded.

Sodium Lauryl Sulphate

Sodium Lauryl Sulphate is a mixture of sodium alkyl sulphates consisting mainly of sodium dodecyl sulphate, $CH_3[CH_2]_{10}CH_2OSO_3Na$.

Sodium Lauryl Sulphate contains not less than 85.0 per cent of sodium alkyl sulphates, calculated as $C_{12}H_{25}NaO_4S$.

Category. Pharmaceutical aid (anionic emulsifying agent).

Description. A white or pale yellow powder or crystals.

Identification

A. A 1 per cent w/v solution, when shaken, produces plenty of foam.

B. Mix 0.1 ml of a 1 per cent w/v solution with 0.1 ml of a 0.1 per cent w/v solution of *methylene blue* and 2 ml of *1 M sulphuric acid*, add 2 ml of *dichloromethane* and shake; the dichloromethane layer is intensely blue.

C. Mix about 10 mg with 10 ml of *ethanol* and heat to boiling on a water-bath, shaking frequently. Filter immediately and evaporate the *ethanol*. Dissolve the residue in 8 ml of *water*, add 3 ml of *2 M hydrochloric acid*, evaporate the solution to half its volume and cool. Filter and to the filtrate add 1 ml of *barium chloride solution*; a white, crystalline precipitate is produced.

D. Gives reaction B of sodium salts (2.3.1).

Tests

Alkalinity. Dissolve 1.0 g in 100 ml of *carbon dioxide-free water* and add 0.1 ml of *phenol red solution*. Not more than 0.5 ml of *0.1 M hydrochloric acid* is required to change the colour of the solution.

Non-esterified alcohols. Not more than 4 per cent, determined by the following method. Dissolve 10.0 g in 100 ml of *water*, add 100 ml of *ethanol (95 per cent)* and extract the solution with three quantities, each of 50 ml, of *n-pentane*, adding *sodium chloride*, if necessary, to promote separation of the two layers. Wash the combined organic layers with three quantities, each of 50 ml, of *water*. Dry the organic solution over *anhydrous sodium sulphate*, filter and evaporate on a water-bath until the odour of pentane is no longer detectable. Heat the residue at 105° for 15 minutes, cool and weigh.

Sodium Chloride and Sodium Sulphate. Not more than a total of 8.0 per cent, determined by the following methods.

For sodium chloride — Dissolve 5.0 g in 50 ml of *water,* add *2 M nitric acid* dropwise until the solution is neutral to *litmus paper*, add 2 ml of *potassium chromate solution* and titrate with *0.1 M silver nitrate.*

1 ml of *0.1 M silver nitrate* is equivalent to 0.005844 g of NaCl.

For sodium sulphate — Dissolve 0.5 g in 20 ml of *water,* warming gently if necessary, and add 1 ml of a 0.05 per cent w/v solution of *dithizone* in *acetone*. If the solution is red, add *1 M nitric acid,* dropwise, until it becomes bluish green. Add 2 ml of *dichloroacetic acid solution* and 80 ml of *acetone* and titrate with *0.01 M lead nitrate* until a permanent orange-red colour is obtained.

1 ml of *0.01 M lead nitrate* is equivalent to 0.001420 g of Na_2SO_4.

Assay. Weigh accurately about 1.15 g, dissolve in sufficient *water* to produce 1000.0 ml, warming if necessary. To 20.0 ml add 15 ml of *chloroform*, 10 ml of *dilute sulphuric acid* and 1 ml of *dimethyl yellow-oracet blue B solution* and titrate with *0.004 M benzethonium chloride*, shaking vigorously and allowing the layers to separate after each addition, until the chloroform layer acquires a permanent clear green colour.

1 ml of *0.004 M benzethonium chloride* is equivalent to 0.001154 g of sodium alkyl sulphates, calculated as $C_{12}H_{25}NaO_4S$.

Storage. Store protected from moisture.

Sodium Metabisulphite

Sodium Pyrosulphite; Sodium Disulphite

$Na_2S_2O_5$ Mol. Wt. 190.1

Sodium Metabisulphite may be prepared by saturating a solution of Sodium Hydroxide with sulphur dioxide and allowing crystallisation to occur.

Sodium Metabisulphite contains not less than 95.0 per cent and not more than 100.5 per cent of $Na_2S_2O_5$.

Category. Pharmaceutical aid (antioxidant).

Description. Colourless, prismatic crystals or a white or creamy white powder; odour, sulphurous.

Identification

A. Gives the reactions of sodium salts (2.3.1).

B. A solution decolorises *iodinated potassium iodide* solution and the resulting solution gives the reactions of sulphates (2.3.1).

Tests

Acidity. A solution is acidic to *phenol red solution*.

Arsenic (2.3.10). Mix 2.5 g in a porcelain dish with 10 ml of *water*, 1.25 g of *potassium chlorate* and 16 ml of *hydrochloric acid* and heat to expel chlorine, remove the last traces of chlorine with a few drops of *stannous chloride solution AsT* and add 35 ml of *water*. The resulting solution complies with the limit test for arsenic (4 ppm).

Heavy metals (2.3.13). Dissolve 1.0 g in 10 ml of *water*, add 5 ml of *hydrochloric acid* and evaporate to dryness on a water-bath. Dissolve the residue in 25 ml of *water* containing 2 ml of *dilute acetic acid*. The solution complies with the limit test for heavy metals, Method A (20 ppm).

Iron. To 0.5 g add 2 ml of *hydrochloric acid* and evaporate on a water-bath to dryness. Dissolve the residue in 2 ml of *hydrochloric acid* and 20 ml of *water* and add a few drops of *bromine solution*, cool, dilute with *water* to 25 ml, then add 50 mg of *ammonium persulphate* and 5 ml of *ammonium thiocyanate solution*. Any colour produced is not more intense than that obtained by adding 5 ml of *ammonium thiocyanate solution* to a mixture of *iron standard solution (20 ppm Fe)*, 2 ml of *hydrochloric acid*, 50 mg of *ammonium persulphate* and sufficient *water* to produce 25 ml (40 ppm).

Thiosulphate. Dissolve 1.0 g in 10 ml of *2 M hydrochloric acid* and heat on a water-bath for 10 minutes; not more than a faint opalescence is produced.

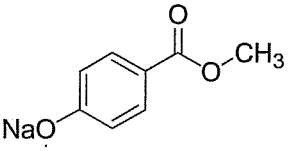
Assay. Weigh accurately about 0.1 g and dissolve in 50.0 ml *0.05 M iodine*, add 1 ml of *hydrochloric acid* and titrate the excess of iodine with *0.1 M sodium thiosulphate* using *starch solution*, added towards the end of the titration, as indicator.

1 ml of *0.05 M iodine* is equivalent to 0.004753 g of $Na_2S_2O_5$.

Storage. Store protected from light and moisture. On exposure to air and moisture it is slowly oxidised to sulphate with disintegration of the crystals.

Sodium Methylparaben

Sodium Methyl Hydroxybenzoate



$C_8H_7NaO_3$ Mol. Wt. 174.1

Sodium Methylparaben is the sodium salt of methyl 4-hydroxybenzoate.

Sodium Methylparaben contains not less than 99.0 per cent and not more than 102.0 per cent of $C_8H_7NaO_3$, calculated on the anhydrous basis.

Category. Pharmaceutical aid (antimicrobial preservative).

Description. A white, crystalline powder; odourless or almost odourless; hygroscopic.

Identification

A. Dissolve 0.5 g in 5 ml of *water* and acidify to *litmus paper* with *hydrochloric acid*; a white precipitate is produced. Wash the precipitate with *water* and dry.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *methylparaben RS*.

B. The residue on ignition gives the reactions of sodium salts (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *water* is clear (2.4.1).

pH (2.4.24). 9.5 to 10.5, determined in a 0.1 per cent w/v solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 1 volume of *glacial acetic acid,* 30 volumes of *water* and 70 volumes of *methanol.*

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of *water.* Immediately add 2 ml of *hydrochloric acid* and shake with 50 ml of *ether.* Evaporate the upper layer to dryness and take up the residue with 10 ml of *acetone.*

Reference solution (a). Dissolve 34.3 mg of *4-hydroxybenzoic acid* (sodium propylparaben impurity A) in 100.0 of *acetone.*

Reference solution (b). Dilute 0.5 ml of test solution (a) to 100.0 ml with *acetone.*

Reference solution (c). Dissolve 10 mg of *ethyl parahydroxybenzoate RS* in 1 ml of test solution (a) and dilute to 10.0 ml with *acetone.*

Apply 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine in ultraviolet light at 254 nm. In the chromatogram obtained with the test solution, any spot due to 4- hydroxybenzoic acid is not more intense than the corresponding spot in the chromatogram obtained with reference solution (a) (4.0 per cent) and any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated principal spots.

Chlorides (2.3.12). Dissolve 1.0 g in 20 ml of *water,* add 0.2 ml of *nitric acid* and filter. 15 ml of the filtrate complies with the limit test for chlorides (330 ppm).

Sulphates (2.3.17). Dissolve 0.5 g in 40 ml of *water,* add 3.5 ml of *2 M hydrochloric acid,* dilute to 60 ml with water and filter. 15 ml of the filtrate complies with the limit test for sulphates (0.12 per cent).

Water (2.3.43). Not more than 5.0 per cent, determined on 1.0 g.

Assay. Dissolve 0.15 g in 50 ml of *anhydrous acetic acid.* Titrate with *0.1 M perchloric acid,* determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01741 g of $C_8H_7NaO_3$.

Storage. Store protected from moisture.

Sodium Phosphate

Disodium Hydrogen Phosphate; Disodium Hydrogen Phosphate Dodecahydrate

$Na_2HPO_4,12H_2O$ Mol. Wt. 358.1

Sodium Phosphate contains not less than 98.0 per cent and not more than 101.0 per cent of Na_2HPO_4, calculated on the anhydrous basis.

Category. Cathartic; pharmaceutical aid (buffering agent).

Description. Colourless, transparent crystals; very efflorescent.

Identification

A 10.0 per cent w/v solution in *distilled water* (solution A) gives the reactions of sodium salts and of phosphates (2.3.1).

Tests

Appearance of solution. Solution A is clear (2.4.1), and colourless (2.4.1).

Arsenic (2.3.10). Dissolve 5.0 g in 50 ml of *water* and add 10 ml of *stannated hydrochloric acid AsT.* The resulting solution complies with the limit test for arsenic (2 ppm).

Heavy metals (2.3.13). Dissolve 2.0 g in 10 ml of *water,* adding 4 ml of *1 M acetic acid* and diluting to 25 ml with *water.* The solution complies with the limit test for heavy metals, Method A (10 ppm).

Iron (2.3.14). 20 ml of solution A complies with the limit test for iron (20 ppm).

Chlorides (2.3.12). To 10 ml of solution A add 10 ml of *2 M nitric acid* and dilute to 20 ml with *water.* The resulting solution complies with the limit test for chlorides (250 ppm).

Sulphates (2.3.17). To 2.5 ml of solution A add 2 ml of *2 M hydrochloric acid* and dilute to 15 ml with *distilled water.* The resulting solution complies with the limit test for sulphates (600 ppm).

Reducing substances. To 5 ml of solution A add 5 ml of *1 M sulphuric acid* and 0.25 ml of *0.02 M potassium permanganate* and heat on a water-bath for 5 minutes; the red colour is not completely discharged.

Sodium dihydrogen phosphate. The value of the expression $(n_2 - 25)/(25 - n_1)$,

where n_1 and n_2 are the titres of *1 M sodium hydroxide* obtained in the Assay, does not exceed 0.025.

Water (2.3.43). 57.0 to 61.0 per cent, determined on 0.1 g dissolved in a mixture of 10 volumes of *methanol* and 40 volumes of *dimethylformamide.*

Assay. Weigh accurately about 4.0 g *(w)*, dissolve in 25 ml of *water*, add 25.0 ml of *1 M hydrochloric acid* and titrate potentiometrically with *1 M sodium hydroxide* to the first inflection of the pH curve (n_1 *ml*). Continue the titration until the second inflection of the curve is reached; the total volume of sodium hydroxide required is n_2 ml.

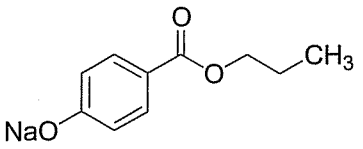
Calculate the content of Na_2HPO_4 from the expression $1420(25 - n_1)/w\,(100 - d)$,

where d is the percentage water content.

Storage. Store protected from moisture.

Sodium Propylparaben

Sodium Propyl Hydroxybenzoate



$C_{10}H_{11}NaO_3$ Mol. Wt. 202.2

Sodium Propylparaben is the sodium salt of propyl 4- hydroxybenzoate.

Sodium Propylparaben contains not less than 99.0 per cent and not more than 102.0 per cent of $C_{10}H_{11}NaO_3$, calculated on the anhydrous basis.

Category. Pharmaceutical aid (antimicrobial preservative).

Description. A white, crystalline powder; odourless or almost odourless; hygroscopic.

Identification

A. Dissolve 0.5 g in 5 ml of *water* and acidify to *litmus paper* with *hydrochloric acid*; a white precipitate is produced. Wash the precipitate with *water* and dry.

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *propylparaben RS*.

B. The residue on ignition gives the reactions of sodium salts (2.3.1).

Tests

Appearance of solution. A 10.0 per cent w/v solution in *water* is clear (2.4.1).

pH (2.4.24). 9.5 to 10.5, determined in a 0.1 per cent w/v solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 1 volume of *glacial acetic acid*, 30 volumes of *water* and 70 volumes of *methanol*.

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of *water*. Immediately add 2 ml of *hydrochloric acid* and shake with 50 ml of *ether*. Evaporate the upper layer to dryness and take up the residue with 10 ml of *acetone*.

Reference solution (a). Dissolve 34.3 mg of *4-hydroxybenzoic acid* (sodium propylparaben impurity A) in 100.0 of *acetone*.

Reference solution (b). Dilute 0.5 ml of test solution (a) to 100 ml with *acetone*.

Reference solution (c). Dissolve 10 mg of *ethyl parahydroxybenzoate RS* in 1 ml of test solution (a) and dilute to 10.0 ml with *acetone*.

Apply 5 µl of each solution. Allow the mobile phase to rise 15 cm. Dry the plate in air and examine in ultraviolet light at 254 nm. In the chromatogram obtained with the test solution, any spot due to 4- hydroxybenzoic acid is not more intense than the corresponding spot in the chromatogram obtained with reference solution (a) (4.0 per cent) and any other secondary spot is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated principal spots.

Chlorides (2.3.12). Dissolve 1.0 g in 20 ml of *water*, add 0.2 ml of *nitric acid* and filter. 15 ml of the filtrate complies with the limit test for chlorides (330 ppm).

Sulphates (2.3.17). Dissolve 0.5 g in 40 ml of *water*, add 3.5 ml of *2 M hydrochloric acid*, dilute to 60 ml with *water* and filter. 15 ml of the filtrate complies with the limit test for sulphates (0.12 per cent).

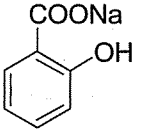
Water (2.3.43). Not more than 5.0 per cen, determined on 1.0 g.

Assay. Dissolve 0.15 g in 50 ml of *anhydrous acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out the blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.02022 g of $C_{10}H_{11}NaO_3$.

Storage. Store protected from moisture.

Sodium Salicylate



$C_7H_5NaO_3$ Mol. Wt. 160.1

Sodium Salicylate is sodium 2-hydroxybenzoate.

Sodium Salicylate contains not less than 99.0 per cent and not more than 101.0 per cent of $C_7H_5NaO_3$, calculated on the dried basis.

Category. Anti-inflammatory; analgesic.

Dose. 500 mg to 2 g, with food; in the treatment of acute rheumatism, 5 to 10 g daily, in divided doses.

Description. Colourless, small crystals or shiny flakes or a white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Test B may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sodium salicylate RS* or with the reference spectrum of sodium salicylate.

B. A 10.0 per cent w/v solution in *carbon dioxide-free water* prepared from *distilled water* (solution A) gives the reactions of salicylates (2.3.1).

C. Gives reaction B of sodium salts (2.3.1).

Tests

Appearance of solution. Solution A is clear (2.4.1), and not more intensely coloured than reference solution BYS6 (2.4.1).

Acidity. To 20 ml of solution A add 0.1 ml of *phenol red solution*; the solution is yellow. Titrate with *0.01 M sodium hydroxide* to a reddish violet colour; not more than 2.0 ml of *0.01 M sodium hydroxide* is required.

Arsenic (2.3.10). Mix 5.0 g with 10 ml of *bromine solution* and evaporate to dryness on a water-bath. Ignite gently, cool, dissolve the residue, ignoring any carbon, in 50 ml of *water* and 14 ml of *brominated hydrochloric acid AsT* and remove the excess of bromine with 2 ml of *stannous chloride solution AsT*. The resulting solution complies with the limit test for arsenic (2 ppm).

Heavy metals (2.3.13). Dissolve 2.0 g in 46 ml of *water*, add with constant stirring 4 ml of *dilute hydrochloric acid*, filtering and using 25 ml of the filtrate. The solution complies with the limit test for heavy metals, Method A (20ppm).

Chlorides (2.3.12). To 25 ml of solution A add 15 ml of *water* and 10 ml of *2 M nitric acid* and filter. 25 ml of the filtrate complies with the limit test for chlorides (200 ppm).

Sulphates (2.3.17). 2.5 ml of solution A diluted to 15 ml with *distilled water* complies with the limit test for sulphates (600 ppm).

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.15 g, dissolve in 30 ml of *anhydrous glacial acetic acid*. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01601 g of $C_7H_5NaO_3$.

Storage. Store protected from light and moisture.

Sodium Starch Glycollate

Sodium Carboxymethyl Starch

Sodium Starch Glycollate is the sodium salt of a poly-α-glucopyranose in which some of the hydroxyl groups are in the form of carboxymethyl ether.

Sodium Starch Glycollate contains not less than 2.8 per cent and not more than 4.5 per cent of sodium, Na, calculated on the material washed with Ethanol (95 per cent) and dried as described under Assay.

Category. Pharmaceutical aid (tablet disintegrant).

Description. A very fine, white or off-white, free-flowing powder; odourless or almost odourless.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sodium starch glycollate RS* or with the reference spectrum of sodium starch glycollate.

B. To 5 ml of a 2 per cent w/v dispersion in *water* add 0.05 ml of *0.005 M iodine*; a dark blue colour is produced.

C. The solution obtained in the test for Heavy metals gives the reactions of sodium salts (2.3.1).

Tests

pH (2.4.24). 5.5 to 7.5, determined in a 2.0 per cent w/v dispersion in *carbon dioxide-free water*.

Heavy metals (2.3.13). To 4.0 g in a silica or platinum dish add 2 ml of a 50 per cent w/v solution of *sulphuric acid*, heat in a water-bath and then cautiously over a flame at about 600°. Continue heating until all black particles have disappeared, allow to cool, add 0.1 ml of *1 M sulphuric acid*, heat to ignition once again and allow to cool. Add 0.1 ml of *2 M ammonium carbonate*, evaporate to dryness and cautiously ignite. To the residue add 5 ml of *hydrochloric acid*, evaporate to dryness on a water-bath and dissolve the residue in 100 ml of *water*. 25 ml of a solution complies with the limit test for heavy metals, Method A (20 ppm).

Iron (2.3.14). 50 ml of the solution obtained in the test for Heavy metals complies with the limit test for iron (20 ppm).

Sodium Chloride. Not more than 10.0 per cent, determined by the following method. To 1.0 g add 20.0 ml of *0.1 M silver nitrate* and 30 ml of *nitric acid* and boil carefully for 30 minutes. Cool and add a sufficient volume of a saturated solution of *potassium permanganate* to change the colour of the solution to red. Discharge the colour by the dropwise addition of *hydrogen peroxide solution (10 vol)*, add 3 ml of *dibutyl phthalate* and titrate with *0.1 M ammonium thiocyanate* using *ferric ammonium sulphate solution* as indicator, shaking vigorously after each addition of titrant. Carry out a blank titration.

1 ml of *0.1 M silver nitrate* is equivalent to 0.005844 g of NaCl.

Sodium glycollate. To 0.2 g add 5 ml of *glacial acetic acid*, mix well and add 5 ml of *water*, stirring occasionally until solution is complete. Slowly add 50 ml of *acetone* with stirring and then add 1 g of *sodium chloride*. Filter, wash the residue with *acetone* and dilute the filtrate to 100 ml with *acetone*. Transfer 2 ml of this solution to an open flask, heat on a water-bath for exactly 20 minutes, cool, add 5 ml of *naphthalenediol reagent* and mix thoroughly. Add a further 15 ml of the same reagent, mix, cover the flask with aluminium foil and heat on a water-bath for 20 minutes. Cool and dilute to 25 ml with *sulphuric acid*. The absorbance (2.4.7) of the resulting solution at the maximum at about 540 nm using *water* as the blank, is not more than that of a solution prepared in the following manner. To 5 ml of a 0.062 per cent w/v solution of *glycollic acid*, previously dried at a pressure not exceeding 2 kPa for 16 hours, add 5 ml of *glacial acetic acid*, dilute to 100 ml with *acetone* and complete the procedure described above beginning at the words "Transfer 2 ml...." (2.0 per cent).

Microbial Contamination (2.2.9). 1.0 g is free from *Escherichia coli* and *Salmonellae*.

Loss on drying (2.4.19). Not more than 10.0 per cent, determined on 0.5 g by drying in an oven at 105°.

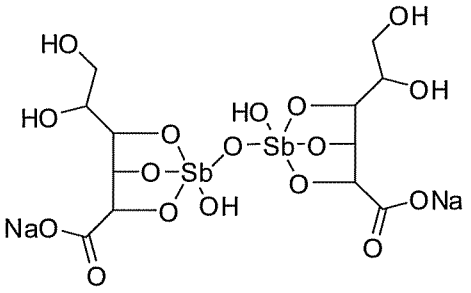
Assay. Weigh accurately about 4.0 g, add 350 ml of a mixture of 4 volumes of *ethanol (95 per cent)* and 1 volume of *water*, add 0.25 ml of *phenolphthalein solution* and mix. Add *1 M sodium hydroxide* dropwise until the colour of the suspension becomes faintly pink, shake for 30 minutes and decant through a sintered glass crucible. Repeat the extraction three times, or until a test for chloride ions is negative. Transfer the bulk of the residue to the crucible, wash the residue with *ethanol (95 per cent)* and dry at 110° to constant weight. Weigh accurately 0.5 g of the residue, add 80 ml of *anhydrous glacial acetic acid*, heat under a reflux condenser for 2 hours, cool. Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25).

1 ml of *0.1 M perchloric acid* is equivalent to 0.0023 g of Na.

Storage. Store protected from light and moisture.

Sodium Stibogluconate

Sodium Antimony Gluconate



Sodium Stibogluconate is mainly the disodium salt of μ-oxy-bis[gluconato(3)-O^2,O^3,O^4-hydroxoantimony].

The method of manufacture is such as to ensure consistently controlled reaction stoichiometry in order to yield sodium stibogluconate that is satisfactory with regard to intrinsic toxicity.

Sodium Stibogluconate contains not less than 30.0 per cent and not more than 34.0 per cent of pentavalent antimony, calculated on the dried and methanol-free basis.

Category. Antiprotozoal.

Dose. By intramuscular or intravenous injection, 600 mg to 2 g daily, for 10 to 30 days.

Description. A colourless, mostly amorphous powder; odourless or almost odourless.

Identification

A. An aqueous solution is *dextro-rotatory*.

B. Pass *hydrogen sulphide* into a 5 per cent w/v solution for several minutes; an orange precipitate is produced.

C. When heated, it chars without melting, emitting an odour of burnt sugar and leaving a residue which gives the reactions of antimony compounds and the reactions of sodium salts (2.3.1).

Tests

pH (2.4.24). 5.0 to 5.6, determined in the solution obtained in the test for Stability of solution.

Stability of solution. Heat a solution containing 10.0 per cent w/v of pentavalent antimony in an autoclave at 115.5° and at a pressure of 70 kPa for 30 minutes. The resulting solution is colourless or almost colourless.

Trivalent antimony. Dissolve 2.0 g in 30 ml of *water*, add 15 ml of *hydrochloric acid* and titrate with *0.00833 M potassium bromate* using *methyl orange solution* as indicator. Not more than 1.3 ml of *0.00833 M potassium bromate* is required.

Chlorides. Dissolve 2.5 g in 50 ml of *water* and add 2 ml of *2 M nitric acid* and 75 ml of *acetate buffer pH 5.0*. Titrate with *0.1 M silver nitrate*, determining the end-point potentiometrically (2.4.25). Not more than 3.0 ml of *0.1 M silver nitrate* is required.

Methanol. Not more than 2.0 per cent w/w, determined by gas chromatography (2.4.13).

Test solution. Add 5 ml of *water* to 0.5 g of the substance under examination and mix with the aid of ultrasound until the solution is complete.

Reference solution (a). Add 5 ml of a 0.2 per cent v/v solution of *ethanol* (internal standard) to 0.5 g of the substance under examination and mix with the aid of ultrasound until the solution is complete.

Reference solution (b). Add 1 ml of a 1.0 per cent v/v solution of *methanol* to 5 ml of a 0.2 per cent v/v solution of the internal standard.

Chromatographic system
- a glass column 1.5 m × 4 mm, packed with porous polymer beads (80 to 100 mesh),
- temperature: column. 130°,

Calculate the percentage w/w of methanol taking 0.792 g as its weight per ml at 20°.

Undue toxicity. Dissolve a suitable quantity of the substance under examination in *water for injections* to give a solution containing 28 mg of pentavalent antimony per ml. Inject intravenously 0.3 ml of the solution into each of 10 mice that have been deprived of food for not less than 17 hours. After injections allow the mice access to food and water. None of the mice dies within 24 hours. If one of the mice dies within 24 hours, repeat the test. None of the second group of mice dies within 24 hours.

Loss on drying (2.4.19). Not more than 15.0 per cent, determined on 0.25 g by drying in an oven at 130° at a pressure not exceeding 0.7 kPa.

Assay. Weigh accurately about 0.16 g, dissolve in 30 ml of *hydrochloric acid*, add 70 ml of *phosphoric acid* and stir carefully until completely mixed. Titrate with *0.05 M ferrous ammonium sulphate* prepared using *sulphuric acid (1 per cent)*, determining the end-point potentiometrically (2.4.25), using a platinum electrode and a silver-silver chloride reference electrode.

1 ml of *0.05 M ferric ammonium sulphate* is equivalent to 0.003044 g of pentavalent antimony.

Storage. Store protected from moisture.

Sodium Stibogluconate Injection

Sodium Antimony Gluconate Injection

Sodium Stibogluconate Injection is a sterile solution of Sodium Stibogluconate in Water for Injections. Injection in multiple dose containers must not contain phenol as preservative.

Sodium Stibogluconate Injection contains not less than 9.5 per cent w/v and not more than 10.5 per cent w/v of pentavalent antimony, Sb.

Usual strength. The equivalent of 100 mg of pentavalent antimony per ml.

Description. A clear, colourless or faintly straw-coloured solution.

Identification

A. It is *dextro*-rotatory.

B. Dilute 2 ml to 10 ml with *water* and pass hydrogen sulphide through the solution; no immediate precipitate is produced. Continue to pass hydrogen sulphide through the solution for several minutes; an orange precipitate is produced.

C. The residue obtained by evaporation to dryness, after incineration, gives the reactions of antimony compounds and the reactions of sodium salts (2.3.1).

Tests

pH (2.4.24). 5.0 to 5.6.

Undue toxicity. Dilute a suitable volume of the injection under examination with sufficient *water for injections* to give a solution containing the equivalent of 28 mg of pentavalent antimony per ml. Inject intravenously 0.3 ml of the solution into each of 10 mice that have been deprived of food for not less than 17 hours. After injections allow the mice access to food and water. None of the mice dies within 24 hours. If one of the mice dies within 24 hours, repeat the test. None of the second group of mice dies within 24 hours.

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. To 1.0 ml, accurately measured, add 30 ml of *hydrochloric acid* and 70 ml of *phosphoric acid* and mix. Titrate with *0.05 M ferric ammonium sulphate* prepared using *sulphuric acid (1 per cent)*, determining the end-point potentiometrically (2.4.25), using a platinum electrode and a silver-silver chloride reference electrode.

1 ml of *0.05 M ferric ammonium sulphate* is equivalent to 0.003044 g of pentavalent antimony.

Labelling. The label states the strength in terms of the equivalent amount of pentavalent antimony per ml.

Sodium Thiosulphate

Sodium Hyposulphite

$Na_2S_2O_3,5H_2O$ Mol. Wt. 248.2

Sodium Thiosulphate contains not less than 99.0 per cent and not more than 101.0 per cent of $Na_2S_2O_3,5H_2O$.

Category. Antidote to cyanide poisoning

Dose. By intravenous or intramuscular injection, 300 mg to 1 g.

Description. Colourless large crystals or a coarse, crystalline powder; odourless; deliquescent in moist air and effloresces in dry air at temperature above 33°. It dissolves in its water of crystallisation at about 49°.

Identification

A. To 0.5 ml of a 10.0 per cent w/v solution in *carbon dioxide-free water* (solution A) add 0.5 ml of *water* and 2 ml of *0.1 M silver nitrate*; a white precipitate is produced which quickly becomes yellowish and finally black.

B. To a portion of solution A add a few drops of *iodine solution*; the colour is discharged.

C. Dilute 2.5 ml of solution A to 5 ml with *water* and add 1 ml of *hydrochloric acid*; a gas is evolved which turns starch-iodate paper blue and a precipitate of sulphur is produced.

D. 1 ml of solution A gives reaction A of sodium salts (2.3.1).

Tests

Appearance of solution. Solution A is clear (2.4.1), and colourless (2.4.1).

pH (2.4.24). 6.0 to 8.4, determined in solution A.

Arsenic (2.3.10). Dissolve 5.0 g in 50 ml of *water* and add 10 ml of *stannated hydrochloric acid AsT*. The resulting solution complies with the limit test for arsenic (2 ppm).

Heavy metals (2.3.13). Dissolve 1.0 g in 10 ml of *water*. Slowly add 5 ml of *dilute hydrochloric acid* and evaporate the mixture to dryness on a water-bath. Gently boil the residue with 15 ml of *water* for 2 minutes and filter. Heat the filtrate to boiling, add sufficient *bromine solution* to the hot filtrate to produce a clear solution and add a slight excess of *bromine solution*. Boil the solution to expel the bromine completely, cool to room temperature and add a drop of *phenolphthalein solution* and *sodium hydroxide solution* until a slight pink colour is produced. Add 2 ml of *dilute acetic acid* and dilute with *water* to 25 ml. The solution complies with the limit test for heavy metals, Method A (20 ppm).

Chlorides (2.3.12). To 12.5 ml of solution A add 15 ml of *2 M nitric acid*, boil gently for 3 to 4 minutes, cool and filter. The filtrate complies with the limit test for chlorides (200 ppm).

Sulphides. To 10 ml of solution A add 0.05 ml of a freshly prepared 5 per cent w/v solution of *sodium nitroprusside*; the solution does not become violet.

Sulphates and sulphites (2.3.17). Dilute 2.5 ml of solution A to 10 ml with *distilled water*. To 3 ml of this solution add 2 ml of *iodine solution* and gradually add more *iodine solution* and dilute to 15 ml with *distilled water*. The resulting solution complies with the limit test for sulphates (0.2 per cent).

Assay. Weigh accurately about 0.5 g, dissolve in 20 ml of *water* and titrate with *0.05 M iodine* using *starch solution*, added towards the end of the titration, as indicator.

1 ml of *0.05 M iodine* is equivalent to 0.02482 g of $Na_2S_2O_3,5H_2O$.

Storage. Store protected from moisture.

Sodium Thiosulphate Injection

Sodium Hyposulphite Injection

Sodium Thiosulphate Injection is a sterile solution of Sodium Thiosulphate in Water for Injections.

Sodium Thiosulphate Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of sodium thiosulphate, $Na_2S_2O_3,5H_2O$.

Usual strength. 100 mg per ml.

Description. A clear, colourless solution.

Identification

A. To 0.5 ml of a 10.0 per cent w/v solution in *carbon dioxide-free water* (solution A) add 0.5 ml of *water* and 2 ml of *0.1 M silver nitrate*; a white precipitate is produced which quickly becomes yellowish and finally black.

B. To a portion of solution A add a few drops of *iodine solution*; the colour is discharged.

C. Dilute 2.5 ml of solution A to 5 ml with *water* and add 1 ml of *hydrochloric acid*; a gas is evolved which turns starch-iodate paper blue and a precipitate of sulphur is produced.

D. 1 ml of solution A gives reaction A of sodium salts (2.3.1).

Tests

pH (2.4.24). 7.0 to 9.0.

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

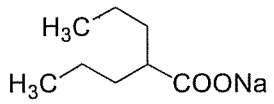
Assay. To an accurately measured volume containing about 0.5 g of Sodium Thiosulphate add about 20 ml of *water* and titrate with *0.05 M iodine*, using 3 ml of *starch solution*, added towards the end of the titration, as indicator.

1 ml of *0.05 M iodine* is equivalent to 0.02482 g of $Na_2S_2O_3,5H_2O$.

Storage. Store in single dose containers.

Sodium Valproate

Divalproex Sodium



$C_8H_{15}NaO_2$ Mol. Wt. 166.2

Sodium Valproate is sodium 2-propylpentanoate.

Sodium Valproate contains not less than 98.5 per cent and not more than 101.0 per cent of $C_8H_{15}NaO_2$, calculated on the dried basis.

Category. Anticonvulsant.

Dose. 600 mg to 1.6 g daily, in divided doses.

Description. A white or almost white, crystalline powder; hygroscopic.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sodium valproate RS* or with the reference spectrum of sodium valproate.

B. In the test for Related substances, the principal peak in the chromatogram obtained with test solution (b) corresponds to the peak in the chromatogram obtained with the reference solution.

C. Dissolve 1.25 g in 20 ml of *distilled water* in a separating funnel, add 5 ml of *2 M nitric acid*, shake and allow the mixture to stand for 12 hours; the lower layer (solution A) gives reactions of sodium salts (2.3.1).

Tests

Appearance of solution. A 20.0 per cent w/v solution is not more opalescent than opalescence standard OS2 (2.4.1), and is not more intensely coloured than reference solution YS6 (2.4.1).

Acidity or alkalinity. To 10 ml of a 10.0 per cent w/v solution in *carbon dioxide-free water* add 0.1 ml of *dilute phenolphthalein solution*; not more than 0.75 ml of either *0.1 M sodium hydroxide* or *0.1 M hydrochloric acid* is required to change the colour of the solution.

Related substances. Determine by gas chromatography (2.3.13).

Test solution (a). Add 5 ml of *1 M sulphuric acid* to 10 ml of a 0.04 per cent w/v solution of the substance under examination and shake with three quantities, each of 20 ml, of *ether*. Add 10 ml of a 0.02 per cent w/v solution of *butyric acid* (internal standard) in *ether* to the combined ether extracts, shake with *anhydrous sodium sulphate*, filter and evaporate the filtrate to a volume of about 10 ml at a temperature not exceeding 30° using a rotary evaporator.

Test solution (b). Add 0.5 ml of *1 M sulphuric acid* to 10 ml of a 0.04 per cent w/v solution of the substance under examination and shake with three quantities, each of 5 ml, of *ether*. Shake the combined ether extracts with *anhydrous sodium sulphate*, filter and evaporate the filtrate to a volume of about 10 ml at a temperature not exceeding 30° using a rotary evaporator.

Test solution (c). Dissolve 0.5 g of the substance under examination in 10 ml of *water*, add 5 ml of *1 M sulphuric acid* and treat as described for test solution (a) beginning at the words "shake with three...".

Reference solution. Prepare in the same manner as test solution (b) but using *sodium valproate RS* in place of the substance under examination.

Chromatographic system

- a glass column 2.6 m × 2 mm, packed with *silanised diatomaceous support* (125 to 180 mesh) impregnated with 5 per cent w/w of *polyethylene glycol 20,000 2-nitroterephthalate* and 1 per cent w/w of *phosphoric acid*,
- temperature. column.150° to 170° to obtain a retention time of about 12 minutes for valproic acid [the principal peak in test solution (b)],
  inlet port at 200° and detector at 300°,
- flow rate. 20 ml per minute of the carrier gas.

Allow the chromatography to proceed for 2.5 times the retention time of valproic acid. Adjust the sensitivity so that the height of the peak due to the internal standard in the chromatogram obtained with test solution (a) is not less than 70 per cent of the full-scale deflection on the recorder. In the chromatogram obtained with test solution (c), the sum of the areas of any secondary peaks is not greater than the area of the peak due to the internal standard. Ignore any peaks the area of which is less than 1 per cent of the area of the peak due to the internal standard. The test is not valid unless the resolution between the peak due to the internal standard and the principal peak in the chromatogram obtained with test solution (a) is at least 12.

Chlorides (2.3.12). Dissolve 1.25 g in 10 ml of *water*. The resulting solution complies with the limit test for chlorides (200 ppm).

Sulphates (2.3.17). Solution A complies with the limit test for sulphates (200 ppm).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B. Use 2 ml of *lead standard solution (10 ppm)* to prepare the standard (20 ppm).

Loss on drying (2.4.19). Not more than 2.0 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.15 g and dissolve in 25 ml of *anhydrous glacial acetic acid.* Titrate with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01662 g of $C_8H_{15}NaO_2$.

Storage. Store protected from moisture.

Sodium Valproate Oral Solution

Sodium Valproate Elixir

Sodium Valproate Oral Solution is a solution of Sodium Valproate in a suitable flavoured vehicle.

Sodium Valproate Oral Solution contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of sodium valproate, $C_8H_{15}NaO_2$.

Usual strength. 200 mg in 5 ml.

Identification

A. Shake a quantity containing about 0.25 g of Sodium Valproate with two quantities, each of 25 ml, of *chloroform* and discard the chloroform extracts. Add 10 ml of a saturated solution of *sodium chloride* and 10 ml of *2 M hydrochloric acid*, mix and shake with 25 ml of *chloroform*. Wash the chloroform layer with 5 ml of *water*, shake with *anhydrous sodium sulphate*, filter and evaporate to dryness.

On the residue determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *valproic acid RS* or with the reference spectrum of valproic acid.

B. Shake a quantity containing about 0.25 g of Sodium Valproate with a mixture of 10 ml of a saturated solution of *sodium chloride*, 10 ml of *2 M hydrochloric acid* and 25 ml of *chloroform*. Evaporate the chloroform layer to dryness, dissolve the residue in 2 ml of *water*, make just alkaline with *2 M sodium hydroxide* and add 0.5 ml of a 10 per cent w/v solution of *cobalt nitrate*; a purple precipitate is produced which is soluble in *dichloromethane*.

Tests

Related substances. Determine by gas chromatography (2.4.13).

Test solution (a). Mix a quantity of the oral solution containing 0.50 g of Sodium Valproate with 10 ml of *water*, acidify with *2 M sulphuric acid* and shake with three quantities, each of 20 ml, of *dichloromethane*. Wash the combined dichloromethane extracts with 10 ml of *water*, shake with *anhydrous sodium sulphate*, filter and evaporate the filtrate to a volume of about 10 ml at a temperature not exceeding 30° using a rotary evaporator.

Test solution (b). Mix a quantity of the oral solution containing 0.5 g of Sodium Valproate with 10 ml of a 0.02 per cent w/v solution of *octanoic acid* (internal standard) in *0.1 M sodium hydroxide* and continue as described for test solution (a) beginning at the words "acidify with *2 M sulphuric acid...*".

Reference solution. A 0.02 per cent w/v solution of the internal standard in *dichloromethane*.

Chromatographic system

- a glass column 1.5 m x 4 mm. packed with *acid-washed, silanised diatomaceous support* (80 to 180 mesh) coated with 15 per cent w/w of free fatty acid phase (such as Supelco FFAP 2-1063) and *1 per cent w/w* of *phosphoric acid,*
- temperature. column. 170°.

In the chromatogram obtained with test solution (b) the sum of the areas of any secondary peaks is not greater than the area of the peak due to the internal standard.

Other tests. Complies with the tests stated under Oral Liquids.

Assay. Weigh accurately a quantity containing about 0.15 g of Sodium Valproate, add 50 ml of *water*, mix thoroughly and add 10 ml of saturated solution of *sodium chloride*, 10 ml of *2 M hydrochloric acid* and 40 ml of a mixture of 2 volumes of *ether* and 1 volume of *light petroleum (40° to 60°),* shake, allow to separate and reserve the ether layer. Shake the aqueous layer with a further 40 ml of the *ether-light petroleum mixture* and discard the aqueous layer. Shake each of the ether extracts with the same three quantities, each of 10 ml, of a saturated solution of *sodium chloride*, combine the extracts and evaporate to a volume of about 1 ml at a temperature not exceeding 30°. Add 50 ml of *ethanol (95 per cent),* previously neutralised with *0.01 M sodium hydroxide* using *dilute phenolphthalein solution* as indicator, and titrate with *0.1 M sodium hydroxide.*

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01662 g of $C_8H_{15}NaO_2$.

Determine the weight per ml of the preparation (2.4.29) and calculate the content of $C_8H_{15}NaO_2$ weight in volume.

Sodium Valproate Tablets

Sodium Valproate Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of sodium valproate, $C_8H_{15}NaO_2$.

Usual strengths. 100 mg; 200 mg.

Identification

A. Shake a quantity of the powdered tablets containing about 0.5 g of Sodium Valproate with 10 ml of *water* and centrifuge. Acidify 5 ml of the supernatant liquid with *2 M sulphuric acid*, shake with 25 ml of *chloroform* and wash the chloroform layer with 5 ml of *water*. Dry by shaking with *anhydrous sodium sulphate*, filter and evaporate the chloroform.

On the residue determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *valproic acid RS* or with the reference spectrum of valproic acid.

B. Shake a quantity of the powdered tablets containing about 0.25 g of Sodium Valproate with 3 ml of *water* and centrifuge. To 2 ml of the supernatant liquid add 0.5 ml of a 10 per cent w/v solution of *cobalt nitrate*; a purple precipitate is produced which is soluble in *dichloromethane*.

Tests

Related substances. Determine by gas chromatography (2.4.13).

Test solution (a). Shake a quantity of the powdered tablets containing 0.50 g of Sodium Valproate with 10 ml of *water*, acidify with *2 M sulphuric acid* and shake with three quantities, each of 20 ml, of *dichloromethane*. Wash the combined dichloromethane extracts with 10 ml of *water*, shake with *anhydrous sodium sulphate*, filter and evaporate the filtrate to a volume of about 10 ml at a temperature not exceeding 30° using a rotary evaporator.

Test solution (b). Shake a quantity of the powdered tablets containing 0.50 g of Sodium Valproate with 10 ml of a 0.020 per cent w/v solution of *octanoic acid* (internal standard) in *0.1 M sodium hydroxide* and continue as described for test solution (a) beginning at the words "acidify with *2 M sulphuric acid...*".

Reference solution. A 0.02 per cent w/v of the internal standard in *dichloromethane*.

Chromatographic system

- a glass column 1.5 m × 4 mm, packed with acid-washed, silanised diatomaceous support (80 to 180 mesh) coated with 15 per cent w/w of free fatty acid phase (such as Supelco FFAP 2-1063) and *1 per cent w/w* of *phosphoric acid,*
- temperature. column. 170°,

In the chromatogram obtained with test solution (b) the sum of the areas of any secondary peaks is not greater than the area of the peak due to the internal standard.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 0.3 g of Sodium Valproate, add 70 ml of *water*, shake for 10 minutes, dilute to 100.0 ml with *water* and filter. To 50.0 ml of the filtrate add 10 ml of a 30 per cent w/v solution of *sodium chloride* and 10 ml of *2 M hydrochloric acid.* Extract with 40 ml of a mixture of 2 volumes of *ether* and 1 volume of *light petroleum (boiling range 40° to 60°)* and allow to separate. Shake the aqueous layer with a further 40 ml of the ether-light petroleum mixture. Shake each of the ether extracts with the same three quantities, each of 10 ml, of a saturated solution of *sodium chloride*, combine the ether extracts and evaporate to a volume of about 1 ml at a temperature not exceeding 30°. Add 50 ml of *ethanol (95 per cent),* previously neutralised with *0.01 M sodium hydroxide* using dilute *phenolphthalein solution* as indicator, and titrate with *0.1 M sodium hydroxide.*

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01662 g of $C_8H_{15}NaO_2$.

Sorbic Acid

$C_6H_8O_2$ Mol. Wt. 112.1

Sorbic Acid is (2*E*,4*E*)-hexa-2,4-dienoic acid.

Sorbic Acid contains not less than 99.0 per cent and not more than 101.0 per cent of $C_6H_8O_2$, calculated on the anhydrous basis.

Category. Pharmaceutical aid (antimicrobial preservative).

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sorbic acid RS* or with the reference spectrum of sorbic acid.

B. Dissolve 50 mg in sufficient *water* to produce 250 ml and dilute 2 ml of this solution to 200 ml with *0.1 M hydrochloric acid.*

When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows an absorption maximum at about 264 nm; absorbance at about 264 nm, 0.43 to 0.51.

C. Dissolve 0.2 g in 2 ml of *ethanol (95 per cent)* and add 0.2 ml of *bromine water*; the solution is decolorised.

Tests

Appearance of solution. A 5.0 per cent w/v solution in *ethanol (95 per cent)* is clear (2.4.1), and colourless (2.4.1).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method A (10 ppm).

Aldehydes. Not more than 0.15 per cent, determined by the following method. Dissolve 1.0 g in a mixture of 50 ml of *2-propanol* and 30 ml of *water*, adjust the pH of the solution to 4.0 with *0.1 M hydrochloric acid* or *0.1 M sodium hydroxide* and dilute to 100 ml with *water*. To 10 ml of the resulting solution add 1 ml of *decolorised fuchsin solution* and allow to stand for 30 minutes. Any colour produced is not more intense than that obtained in a solution prepared simultaneously by adding 1 ml of *decolorised fuchsin* solution to a mixture of 1.5 ml of *acetaldehyde standard solution (100 ppm C_2H_4O)*, 4 ml of *2-propanol* and 4.5 ml of *water*.

Sulphated ash (2.3.18). Not more than 0.2 per cent.

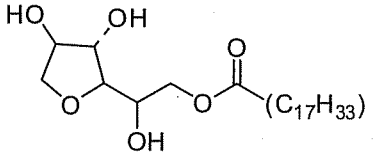
Water (2.3.43). Not more than 1.0 per cent, determined on 2.0 g.

Assay. Weigh accurately about 0.2 g, dissolve in 20 ml of *ethanol (95 per cent)* and titrate with *0.1 M sodium hydroxide*, using 0.2 ml of *phenolphthalein solution* as indicator, until a pink colour is produced.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01121 g of $C_6H_8O_2$.

Storage. Store protected from light and moisture.

Sorbitan Oleate



$C_{24}H_{44}O_6$ Mol. Wt. 428.6

Sorbitan Oleate is mixture usually obtained by esterification of 1 mole of sorbitol and its mono-and di- anhydrides per mole of oleic (*cis*-9-octadecenoic) acid. A suitable antioxidant may be added.

NOTE—When sorbitan mono-oleate is demanded, Sorbitan Oleate shall be supplied.

Description. A brownish-yellow, viscous liquid.

Identification

A. Complies with the test for hydroxyl value (2.3.27).

B. Complies with the test for iodine value (2.3.28).

C. Complies with the test for composition of fatty acids.

D. *Margaric acid.* Not more than 0.2 per cent for oleic acid of vegetable origin and not more than 4.0 per cent for oleic acid of animal origin.

Tests

Relative density (2.4.29). About 0.99.

Acid value (2.3.23). Not more than 8.0, determined on 5.0 g.

Hydroxyl value (2.3.27). 190 to 210.

Saponification value (2.3.37). 145 to 160. Carry out the saponification for 1 hour.

Iodine value (2.3.28). 62 to 76.

Peroxide value (2.3.35). Not more than 10.0.

Composition of fatty acids. Determine by gas chromatography (2.4.13).

Composition of the fatty acid fraction of the substance:

— *myristic acid:* Not more than 5.0 per cent;

— *palmitic acid:* Not more than 16.0 per cent;

— *palmitoleic acid:* Not more than 8.0 per cent;

— *stearic acid:* Not more than 6.0 per cent;

— *oleic acid:* 65.0 per cent to 88.0 per cent;

— *linoleic acid:* Not more than 18.0 per cent;

— *linolenic acid:* Not more than 4.0 per cent;

— *fatty acids with chain length greater than C_{18}:* Not more than 4.0 per cent.

Heavy metals (2.3.13). In a silica crucible, mix thoroughly 2.0 g of the substance under examination with 0.5 g of *magnesium oxide*. Ignite to dull redness until a homogeneous white or greyish-white mass is obtained.

If after 30 min of ignition the mixture remains coloured, allow to cool, mix using a fine glass rod and repeat the ignition. If necessary repeat the operation. Heat at 800° for about 1 hour. Take up the residue in 2 quantities, each of 5 ml, of a mixture of equal volumes of *hydrochloric acid* and *water*. Add 0.1 ml of *phenolphthalein solution* and then *concentrated ammonia* until a pink colour is obtained. Cool, add *glacial acetic acid* until the solution is decolourised and add 0.5 ml in excess. Filter if necessary and wash the filter. Dilute to 20 ml with *water*. 12 ml of resultant solution complies with the limit test for heavy metals, Method D (10 ppm).

Total ash (2.3.19). Not more than 0.5 per cent, determined on 1.5 g.

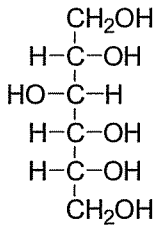
Water (2.3.43). Not more than 1.5 per cent, determined on 1.0 g.

Storage. Store protected from light.

Labelling. The label states the origin of the oleic acid used (animal or vegetable).

Sorbitol

D-Glucitol



$C_6H_{14}O_6$ Mol. Wt. 182.2

Sorbitol is D-glucitol, a hexahydric alcohol related to glucose.

Sorbitol contains not less than 98.0 per cent and not more than 101.0 per cent of $C_6H_{14}O_6$, calculated on the anhydrous basis.

Category. Nutrient (for parenteral administration); pharmaceutical aid (sweetening agent; excipient).

Description. A white, crystalline powder; odourless.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with reference solution (a).

B. Dissolve 50 mg in 3 ml of *water*, add 3 ml of *catechol solution* and pour the mixture into 6 ml of *sulphuric acid*; a pink colour is produced.

C. Dissolve 5 g in 3 ml of *water* with the aid of gentle heat, cool, add 7 ml of *methanol*, 1 ml of *benzaldehyde* and 1 ml of *hydrochloric acid*, mix and shake continuously for 2 hours. Filter, dissolve the crystals in 20 ml of boiling *sodium bicarbonate solution* and allow to crystallise. The residue, after washing rapidly with 5 ml of a mixture of equal volumes of *methanol* and *water* and drying in a current of air, melts at about 175° (2.4.21).

Tests

Appearance of solution. Solution A is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. Dissolve 5.0 g in sufficient *carbon dioxide-free water* prepared from *distilled water* to produce 50 ml (solution A). To 10 ml of solution A add 10 ml of *carbon dioxide-free water*. To 10 ml of the resulting solution add 0.05 ml of *phenolphthalein solution*; not more than 0.2 ml of *0.01 M sodium hydroxide* is required to change the colour of the solution to pink. To a further 10 ml of the solution add 0.05 ml of *methyl red solution*; Not more than 0.3 ml of *0.01 M hydrochloric acid* is required to change the colour of the solution to red.

Specific optical rotation (2.4.22). +4.0° to +7.0°, determined in a solution prepared in the following manner. Dissolve a mixture of 5.0 g of the substance under examination and 6.4 g of *borax* in 40 ml of *water*, allow to stand for 1 hour, shaking occasionally, dilute to 50 ml with *water* and filter, if necessary.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 5.0 g of the substance under examination in 100.0 ml of *water*.

Reference solution (a). Dissolve 0.5 g of *sorbitol RS* in 10.0 ml of *water*.

Reference solution (b). Dilute 2.0 ml of the test solution to 100.0 ml with *water*.

Reference solution (c). Dilute 5.0 ml of reference solution (b) to 100.0 ml with *water*.

Reference solution (d). Dissolve 0.5 g each of *sorbitol* and *mannitol (sorbitol impurity A)* in 10.0 ml of *water*.

Chromatographic system

- a stainless steel column 30 cm x 7.8 mm, packed with strong cation exchange resin (calcium form) (9 µm),
- column temperature. 85°,
- mobile phase: *water*,
- flow rate. 0.5 ml per minute,
- refractometer at a constant temperature,
- injection volume. 20 µl.

Inject reference solution (d). The test is not valid unless the resolution between the peaks due to sorbitol and sorbitol impurity A is not less than 2.0. The relative retention time with reference to sorbitol for maltitol (sorbitol impurity C) is about 0.6, for mannitol (sorbitol impurity A) is about 0.8 and for iditol (sorbitol impurity B) is about 1.1.

Inject the test solution, reference solution (b), (c) and (d). Run the chromatogram 3 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent) and the sum of all the secondary peaks is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent).

Arsenic (2.3.10). Dissolve 5.0 g in 50 ml of *water* and add 10 ml of *stannated hydrochloric acid AsT*. The resulting solution complies with the limit test for arsenic (2 ppm).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method A (10 ppm).

Chlorides (2.3.12). 5.0 g complies with the limit test for chlorides (50 ppm).

Nickel. Dissolve 10.0 g in sufficient *water* to produce 20 ml, add 3 ml of *bromine water* and 2 ml of a 20 per cent w/v solution of *citric acid*, mix and add 10 ml of *6 M ammonia* and 1 ml of a 1 per cent w/v solution of *dimethylglyoxime* in *ethanol (95 per cent)*. Mix, dilute to 50 ml with *water* and allow to stand for 5 minutes; any colour produced is not more intense than that produced by treating in the same manner and at the same time 1.0 ml of *nickel standard solution (10 ppm Ni)* diluted to 20 ml with *water* (1 ppm).

Sulphates (2.3.17). 12 ml of solution A complies with the limit test for sulphates (125 ppm).

Reducing sugars. Dissolve 5.0 g in 3 ml of *water* with the aid of gentle heat, cool, add 20 ml of *cupri-citric solution* and a few glass beads, heat in such a manner that the solution boils in 4 minutes and continue boiling for a further 3 minutes. Cool rapidly and add 100 ml of a 2.4 per cent v/v solution of *glacial acetic acid* followed by 20.0 ml of *0.025 M iodine*. Add, shaking continuously, 25 ml of a 6 per cent v/v solution of *hydrochloric acid* and, when any precipitate has redissolved, titrate the excess iodine with *0.05 M sodium thiosulphate* using 1 ml of *starch solution*, added towards the end of the titration, as indicator. Not less than 12.8 ml of *0.05 M sodium thiosulphate* is required.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). Not more than 1.5 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14) as described in the test for Related substances with the following modification.

Inject the test solution and reference solution (a).

Calculate the content of $C_6H_{14}O_6$.

Sorbitol intended for use in the manufacture of parenteral preparations without a further appropriate procedure for removal of bacterial endotoxins *complies with the following additional requirement.*

Bacterial endotoxins (2.2.3). Not more than 4.0 Endotoxin Units per g for parenteral preparations having a concentration of less than 10 per cent w/v of sorbitol and not more than 2.5 Endotoxin Units per g for parenteral preparations containing 10 per cent w/v or more of sorbitol.

Storage. Store protected from moisture.

Labelling. The label states whether or not the contents are intended for use in the manufacture of parenteral preparations.

Sorbitol Solution (70 Per cent) (Crystallising)

Sorbitol (70 Per cent) (Crystallising)

Sorbitol Solution (70 per cent) (Crystallising) is an aqueous solution of hexitols.

Sorbitol Solution (70 per cent) (Crystallising) contains not less than 68.0 per cent w/w and not more than 72.0 per cent w/w of hexitols, calculated as D-glucitol ($C_6H_{14}O_6$).

Category. Pharmaceutical aid (sweetening vehicle); humectant.

Description. A clear, colourless, syrupy liquid.

Identification

A. Dilute 7.0 g with 40 ml of *water*, add 6.4 g of *borax*, allow to stand for 1 hour, shaking occasionally, and dilute to 50.0 ml with *water*. Filter if necessary. The optical rotation of the resulting solution is 0° to +1.5° (2.4.22).

B. Dry 1 g over *phosphorus pentoxide* at a pressure of 1.5 to 2.5 kPa. Heat 0.5 g of the residue with a mixture of 5 ml of *acetic anhydride* and 0.5 ml *pyridine* with the aid of heat and allow to stand for 10 minutes. Pour the mixture into 25 ml of *water*, allow to stand in ice for 2 hours and filter. The precipitate, after recrystallisation from a small volume of *ethanol (95 per cent)* and drying over *phosphorus pentoxide* at a pressure of 1.5 to 2.5 kPa, melts at about 100° (2.4.21).

C. Determine by thin-layer chromatography (2.4.17), coating the plate with a uniform 0.75-mm thick layer of the following mixture. Mix 0.1 g of *carbomer* with 110 ml of *water* and allow to stand, with gentle stirring, for 1 hour. Adjust to pH 7.0 by the gradual addition, with continuous shaking, of *2 M sodium hydroxide* and add 30 g of *silica gel H*. Heat the plate at 110° for 1 hour, allow to cool and use immediately.

Mobile phase. A mixture of 85 volumes of *2-propanol* and 15 volumes of a 0.2 per cent w/v solution of *boric acid*.

Test solution. Dissolve 0.35 g of the substance under examination in 100 ml of *ethanol (95 per cent)*.

Reference solution. A 0.25 per cent w/v solution of *sorbitol RS* in *ethanol (95 per cent)*.

Apply to the plate 2 µl of each solution. After development, dry the plate at 100° to 105° for 15 minutes, allow to cool, spray with a 0.5 per cent w/v solution of *potassium permanganate* in *1 M sodium hydroxide* and heat at 100° for 2 minutes. The principal spot in the chromatogram obtained with the test

solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Appearance of solution. A 14.0 per cent w/v solution in *carbon dioxide–free water* (solution A) is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. To 10 ml of solution A add 0.05 ml of *phenolphthalein solution*; not more than 0.2 ml of *0.01 M sodium hydroxide* is required to change the colour of the solution to pink. To a further 10 ml of the solution add 0.05 ml of *methyl red solution*. Not more than 0.3 ml of *0.01 M hydrochloric acid* is required to change the colour of the solution to red.

Refractive index (2.4.27). 1.457 to 1.462.

Relative density (2.4.29). Not less than 1.290.

Arsenic (2.3.10). Dissolve 5.0 g in 50 ml of *water* and add 10 ml of *stannated hydrochloric acid AsT*. The resulting solution complies with the limit test for arsenic (2 ppm).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method A (10 ppm).

Chlorides (2.3.12). 5.0 g complies with the limit test for chlorides (50 ppm).

Nickel. Dissolve 10.0 g in sufficient *water* to produce 20 ml, add 3 ml of *bromine water* and 2 ml of a 20 per cent w/v solution of *citric acid*, mix and add 10 ml of *6 M ammonia* and 1 ml of a 1 per cent w/v solution of *dimethylglyoxime* in *ethanol (95 per cent)*. Mix, dilute to 50 ml with *water* and allow to stand for 5 minutes; any colour produced is not more intense than that produced by treating in the same manner and at the same time 1.0 ml of *nickel standard solution (10 ppm Ni)* diluted to 20 ml with *water* (1 ppm).

Sulphates (2.3.17). 12 ml of solution A complies with the limit test for sulphates (125 ppm).

Reducing sugars. Dissolve 5.0 g in 3 ml of *water* with the aid of gentle heat, cool, add 20 ml of *cupri-citric solution* and a few glass beads, heat in such a manner that the solution boils in 4 minutes and continue boiling for a further 3 minutes. Cool rapidly and add 100 ml of a 2.4 per cent v/v solution of *glacial acetic acid* followed by 20.0 ml of *0.025 M iodine*. Add, shaking continuously, 25 ml of a 6 per cent v/v solution of *hydrochloric acid* and, when any precipitate has redissolved, titrate the excess iodine with *0.05 M sodium thiosulphate* using 1 ml of *starch solution*, added towards the end of the titration, as indicator. Not less than 12.8 ml of *0.05 M sodium thiosulphate* is required.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 1.0 g of the substance under examination in 50.0 ml of *water*.

Reference solution (a). Dissolve 65 mg of *sorbitol RS* in 5.0 ml of *water*.

Reference solution (b). Dissolve 65 mg each of *mannitol* and *sorbitol* in 5.0 ml of *water*.

Chromatographic system
- a stainless steel column 30 cm x 7.8 mm, packed with strong cation exchange resin (calcium form) (9 µm),
- column temperature. 85°,
- mobile phase: *water*,
- flow rate. 0.5 ml per minute,
- refractometer at a constant temperature,
- injection volume. 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to sorbitol and mannitol (sorbitol impurity A) is not less than 2.0. The relative retention time with reference to sorbitol for mannitol (sorbitol impurity C) is about 0.8.

Inject the test solution and reference solution (a).

Calculate the content of D-sorbitol, $C_6H_{14}O_6$.

Storage. Store protected from moisture.

Sorbitol Solution (70 Per cent) (Non-Crystallising)

Sorbitol (70 per cent) (Non-crystallising)

Sorbitol Solution (70 per cent) (Non-crystallising) is an aqueous solution of hydrogenated, partly hydrolysed starch.

Sorbitol Solution (70 per cent) (Non-crystallising) contains not less than 68.0 per cent w/w and not more than 72.0 per cent w/w of solid matter and not less than 62.0 per cent w/w of polyols expressed as D-glucitol ($C_6H_{14}O_6$).

Category. Pharmaceutical aid (sweetening vehicle); humectant.

Description. A clear, colourless or faintly yellow, syrupy liquid; odourless.

Identification

A. Dilute 7.0 g with sufficient *carbon dioxide-free water* to produce 50 ml (solution A). To 3 ml of a freshly prepared 10 per cent w/v solution of *catechol* add 6 ml of *sulphuric acid* while cooling in ice. To 3 ml of the mixture add 0.3 ml of solution A and heat gently over a naked flame for 30 seconds; a pink colour is produced which becomes deep brownish red.

B. Dry 1 g over *phosphorus pentoxide* at 80° at a pressure of 1.5 to 2.5 kPa. Dissolve 0.5 g of the residue in a mixture of 5 ml

of *acetic anhydride* and 0.5 ml of *pyridine* with the aid of heat and allow to stand for 10 minutes. Pour the mixture into 25 ml of *water*, allow to stand in ice for 2 hours and filter. The residue, after recrystallisation from a small volume of *ethanol (95 per cent)* and drying over *phosphorus pentoxide* at a pressure of 1.5 to 2.5 kPa, melts at about 100° (2.4.21).

C. Determine by thin-layer chromatography (2.4.17), coating the plate with a uniform 0.75-mm thick layer of the following mixture. Mix 0.1 g of *carbomer* with 110 ml of *water* and allow to stand, with gentle stirring, for 1 hour. Adjust to pH 7.0 by the gradual addition, with continuous shaking, of *2 M sodium hydroxide* and add 30 g of *silica gel H*. Heat the plate at 110° for 1 hour, allow to cool and use immediately.

Mobile phase. A mixture of 85 volumes of *2-propanol* and 15 volumes of a 0.2 per cent w/v solution of *boric acid.*

Test solution. Dissolve 0.35 g of the substance under examination in 100 ml of *ethanol (95 per cent).*

Reference solution. A 0.25 per cent w/v solution of *sorbitol RS* in *ethanol (95 per cent).*

Apply to the plate 2 µl of each solution. After development, dry the plate at 100° to 105° for 15 minutes, allow to cool, spray with a 0.5 per cent w/v solution of *potassium permanganate* in *1 M sodium hydroxide* and heat at 100° for 2 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

Appearance of solution. Solution A is clear (2.4.1), and colourless (2.4.1).

Acidity or alkalinity. To 10 ml of solution A add 10 ml of *carbon dioxide-free water*. To 10 ml of the resulting solution add 0.05 ml of *phenolphthalein solution*; not more than 0.2 ml of *0.01 M sodium hydroxide* is required to change the colour of the solution to pink. To a further 10 ml of the solution add 0.05 ml of *methyl red solution*; Not more than 0.3 ml of *0.01 M hydrochloric acid* is required to change the colour of the solution to red.

Optical rotation (2.4.22). +1.5° to + 3.5°, determined in a solution prepared in the following manner. Dilute 7.0 g with 40 ml of *water*, add 6.4 g of *borax*, allow to stand for 1 hour, shaking occasionally, dilute to 50 ml with *water* and filter, if necessary.

Refractive index (2.4.27). 1.455 to 1.465.

Relative density (2.4.29). Not less than 1.285.

Arsenic (2.3.10). Dissolve 5.0 g in 50 ml of *water* and add 10 ml of *stannated hydrochloric acid AsT*. The resulting solution complies with the limit test for arsenic (2 ppm).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method A (10 ppm).

Chlorides (2.3.12). 5.0 g complies with the limit test for chlorides (50 ppm).

Nickel. Dissolve 10.0 g in sufficient *water* to produce 20 ml, add 3 ml of *bromine water* and 2 ml of a 20 per cent w/v solution of *citric acid*, mix and add 10 ml of *6 M ammonia* and 1 ml of a 1 per cent w/v solution of *dimethylglyoxime* in *ethanol (95 per cent)*. Mix, dilute to 50 ml with *water* and allow to stand for 5 minutes; any colour produced is not more intense than that produced by treating in the same manner and at the same time 1.0 ml of *nickel standard solution (10 ppm Ni)* diluted to 20 ml with *water* (1 ppm).

Sulphates (2.3.17). 12 ml of solution A complies with the limit test for sulphates (125 ppm).

Reducing sugars. Dissolve 5.0 g in 3 ml of *water* with the aid of gentle heat, cool, add 20 ml of *cupri-citric solution* and a few glass beads, heat in such a manner that the solution boils in 4 minutes and continue boiling for a further 3 minutes. Cool rapidly and add 100 ml of a 2.4 per cent v/v solution of *glacial acetic acid* followed by 20.0 ml of *0.025 M iodine*. Add, shaking continuously, 25 ml of a 6 per cent v/v solution of *hydrochloric acid* and, when any precipitate has redissolved, titrate the excess iodine with *0.05 M sodium thiosulphate* using 1 ml of *starch solution*, added towards the end of the titration, as indicator. Not less than 12.8 ml of *0.05 M sodium thiosulphate* is required.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 1.0 g of the substance under examination in 50.0 ml of *water.*

Reference solution (a). Dissolve 55 mg of *sorbitol RS* in 5.0 ml of *water.*

Reference solution (b). Dissolve 65 mg of *mannitol* and 55 mg of *sorbitol* in 5.0 ml of *water.*

Chromatographic system

- a stainless steel column 30 cm x 7.8 mm, packed with strong cation exchange resin (calcium form) (9 µm),
- column temperature. 85°,
- mobile phase: *water*,
- flow rate. 0.5 ml per minute,
- refractometer at a constant temperature,
- injection volume. 20 µl.

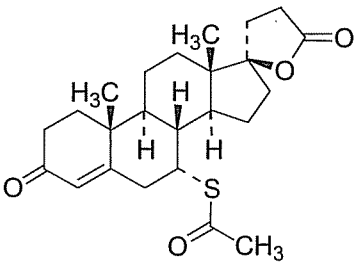
Inject reference solution (b). The test is not valid unless the resolution between the peaks due to sorbitol and mannitol (sorbitol impurity A) is not less than 2.0. The relative retention time with reference to sorbitol for mannitol (sorbitol impurity C) is about 0.8.

Inject the test solution and reference solution (a).

Calculate the content of D-sorbitol, $C_6H_{14}O_6$.

Storage. Store protected from moisture.

Spironolactone



$C_{24}H_{32}O_4S$ Mol. Wt. 416.6

Spironolactone is 7α-acetylthio-3-oxo-17α-pregn-4-ene-21,17β-carbolactone.

Spironolactone contains not less than 97.0 per cent and not more than 102.0 per cent of $C_{24}H_{32}O_4S$, calculated on the dried basis.

Category. Diuretic.

Dose. 100 to 200 mg daily, in divided doses.

Description. A yellowish white to buff coloured powder; odourless or with a slight odour of thioacetic acid. It exhibits polymorphism.

Identification

Test A may be omitted if tests B and C are carried out. Test B may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *spironolactone RS* or with the reference spectrum of spironolactone. Examine the substances as 5 per cent w/v solutions in *chloroform*.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. A mixture of 90 volumes of *acetone* and 10 volumes of *1,2-propanediol*.

Mobile phase. A mixture of 40 volumes of *cyclohexane* and 10 volumes of *toluene*.

Test solution. Dissolve 25 mg of the substance under examination in 10 ml of the solvent mixture.

Reference solution (a). Dissolve 25 mg of *spironolactone RS* in 10 ml of the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

C. Shake about 10 mg with 2 ml of *sulphuric acid (50 per cent)*; an orange solution with an intense yellowish fluorescence is produced. Heat the solution gently; the colour becomes deep red and hydrogen sulphide is evolved which turns *lead acetate paper* black. Add the solution to 10 ml of *water*; a greenish yellow solution is produced which shows opalescence or a precipitate.

Tests

Specific optical rotation (2.4.22). –33.0° to –37.0°, determined in a 1.0 per cent w/v solution in *chloroform*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 62.5 mg of the substance under examination in 2.5 ml of *tetrahydrofuran* and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 25 mg of *canrenone RS* in 1.0 ml of *tetrahydrofuran* and dilute to 10.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 100.0 ml with the mobile phase.

Reference solution (d). Dilute 1.0 ml of the test solution and 1 ml of reference solution (b) to 100.0 ml with the mobile phase.

Reference solution (e). Dilute 0.5 ml of reference solution (a) to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 8 volumes of *acetonitrile*, 18 volumes of *tetrahydrofuran* and 74 volumes of *water*,
- flow rate. 1.8 ml per minute,

- spectrophotometer set at 254 nm and 283 nm,
- injection volume. 20 µl.

Inject reference solution (d). The test is not valid unless the resolution between the peaks due to canrenone and spironolactone is not less than 1.4 and the signal-to-noise ratio of the principal peak is not less than 6.

Inject the test solution, reference solution (a), (c), (d) and (e). At 254 nm, run the chromatogram twice the retention time of the principal peak. In the chromatogram obtained with the test solution, the sum of the areas of all the secondary peaks other than canrenone, is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (e). At 283 nm, the area of the peak due to canrenone is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (1.0 per cent). Calculate the content of canrenone at 283 nm and the content of the other impurities at 254 nm. The sum of areas of all the peaks is not more than 1.0 per cent.

Chromium. Mix 0.2 g with 1 g of *potassium carbonate* and 0.3 g of *potassium nitrate* in a platinum crucible, heat gently until fused and ignite at 600° to 650° until the carbon is removed. Cool, dissolve the residue as completely as possible in 10 ml of *water* with the aid of gentle heat, filter and dilute to 20 ml with *water*. To 10 ml of the solution add 0.5 g of *urea* and just acidify with *sulphuric acid (14 per cent)*. When effervescence ceases add a further 1 ml of *sulphuric acid (14 per cent)*, dilute to 20 ml with *water* and add 0.5 ml of *diphenylcarbazide solution*. Any colour produced is not more intense than that obtained by adding 1 ml of *sulphuric acid (14 per cent)* to 0.5 ml of a freshly prepared 0.00283 per cent w/v solution of *potassium dichromate*, diluting to 20 ml with *water* and adding 0.5 ml of *diphenylcarbazide solution* (50 ppm).

Free mercapto compounds. Shake 2.0 g with 20 ml of *water* for 1 minute and filter. To 10 ml of the filtrate add 0.05 ml of *0.01 M iodine* and 0.1 ml of *starch solution* and mix; a blue colour develops.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours,

Assay. Weigh accurately about 50 mg, dissolve in sufficient *methanol* to produce 250.0 ml, dilute 5.0 ml to 100.0 ml with *methanol* and measure the absorbance of the resulting solution at the maximum at about 238 nm (2.4.7).

Calculate the content of $C_{24}H_{32}O_4S$ taking 470 as the specific absorbance at 238 nm.

Storage. Store protected from light and moisture.

Spironolactone Tablets

Spironolactone Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of spironolactone, $C_{24}H_{32}O_4S$. The tablets may contain added flavouring agents.

Usual strengths. 25 mg; 50 mg; 100 mg.

Identification

A. Extract a quantity of the powdered tablets containing 0.125 g of Spironolactone with two quantities, each of 10 ml, of *chloroform*, filter, evaporate the combined filtrates to dryness and dissolve the residue in 2.5 ml of chloroform.

On the resulting solution determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *spironolactone RS* or with the reference spectrum of spironolactone.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. A mixture of 90 volumes of *acetone* and 10 volumes of *1,2-propanediol*.

Mobile phase. A mixture of 40 volumes of *cyclohexane* and 10 volumes of *toluene*.

Test solution. Extract a quantity of the powdered tablets containing 50 mg of Spironolactone with 10 ml of *chloroform*, filter and evaporate the filtrate to dryness. Dissolve 25 mg the residue in 10 ml of the solvent mixture.

Reference solution (a). Dissolve 25 mg of *spironolactone RS* in 10 ml of the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot.

C. Shake about 10 mg of the residue obtained in test B with 2 ml of *sulphuric acid (50 per cent);* an orange solution with an intense yellowish fluorescence is produced. Heat the solution gently; the colour becomes deep red and hydrogen sulphide is evolved which turns *lead acetate paper* black. Add the solution to 10 ml of *water*; a greenish yellow solution is produced which shows opalescence or a precipitate.

Tests

Dissolution (2.5.2).

Apparatus. No. 1,

Medium. 1000 ml of *0.1 M hydrochloric acid* containing 0.1 per cent w/v of *sodium dodecyl sulphate*,

Speed and time. 75 rpm and 60 minutes.

Withdraw a suitable volume of the medium, filter through a membrane filter disc with an average pore diameter not greater than 1.0 µm. Measure the absorbance of the filtrate, suitably diluted if necessary, at the maximum at about 242 nm (2.4.7). Calculate the content of $C_{24}H_{32}O_4S$ in the medium taking 445 as the specific absorbance at 242 nm.

D. Not less than 70.0 per cent of the stated amount of $C_{24}H_{32}O_4S$.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Disperse a quantity of the powdered tablets containing about 62.5 mg of Spironolactone with 25 ml of *chloroform*, sonicate for 15 minutes, centrifuge and filter the supernatant. Repeat the procedure on the residue with a further 25 ml of *chloroform*. Combine the chloroform extracts and evaporate to dryness using a rotary evaporator. Add 2.5 ml of *tetrahydrofuran* and 22.5 ml of the mobile phase to the residue.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 25 mg of *canrenone RS* in 1.0 ml of *tetrahydrofuran* and dilute to 10.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 100.0 ml with the mobile phase.

Reference solution (d). Dilute 1.0 ml of the test solution and 1.0 ml of reference solution (b) to 100.0 ml with the mobile phase.

Reference solution (e). Dilute 0.5 ml of reference solution (a) to 10.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with endcapped octylsilane bonded to porous silica (5 µm) (such as Spherisorb C8),
- mobile phase: a mixture of 8 volumes of *acetonitrile*, 18 volumes of *tetrahydrofuran* and 74 volumes of *water*,
- flow rate. 1.8 ml per minute,
- spectrophotometer set at 254 nm and 283 nm,
- injection volume. 20 µl.

Inject reference solution (d). The test is not valid unless the resolution between the peaks due to canrenone and spironolactone is not less than 1.4 and the signal-to-noise ratio of the principal peak is not less than 6.

Inject the test solution, reference solution (a), (c), (d) and (e). At 254 nm, run the chromatogram twice the retention time of principal peak. In the chromatogram obtained with the test solution, the sum of the areas of all the secondary peaks other than the canrenone, is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Ignore any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (e). At 283 nm, the area of the peak due to canrenone is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (1.0 per cent). Calculate the content of canrenone at 283 nm and the content of the other impurities at 254 nm. The sum of areas of all the peaks is not more than 1.0 per cent.

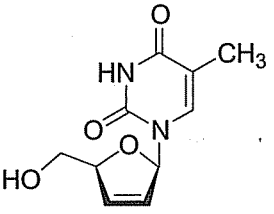
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 25 mg of Spironolactone, add 100 ml of *methanol* and heat just to boiling, with swirling. Cool, add sufficient *methanol* to produce 250.0 ml, dilute 10.0 ml to 100.0 ml with *methanol* and measure the absorbance of the resulting solution at the maximum at about 238 nm (2.4.7).

Calculate the content of $C_{24}H_{32}O_4S$ taking 470 as the specific absorbance at 238 nm.

Storage. Store protected from light and moisture.

Stavudine



$C_{10}H_{12}N_2O_4$ Mol. Wt. 224.2

Stavudine is 2',3'-didehydro-3'-deoxythymidine.

Stavudine contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{10}H_{12}N_2O_4$, calculated on the dried basis.

Category. Antiretroviral.

Dose. 30 to 40 mg twice daily depending on body weight of the patient.

Description. A white or almost white powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *stavudine RS* or with the reference spectrum of stavudine.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to stavudine in the chromatogram obtained with reference solution (c).

C. Melts at about 164° (2.4.21).

Tests

Specific optical rotation (2.4.22). –39.0° to –46.0°, determined in a 0.7 per cent w/v solution in *water*.

Related substances. Determine by liquid chromatography (2.4.14), as described in the Assay.

Separately inject the test solution, reference solutions (a) and (b) and record the chromatograms for at least three times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any peak corresponding to thymine is not greater than the area of the peak in the chromatogram obtained with reference solution (b) (1 per cent); the area of any peak corresponding to β-thymidine is not greater than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (1 per cent); the area of any individual impurity peak other than thymine and β-thymidine is not more than 0.5 per cent and the sum of the areas of all the impurity peaks other than thymine and β-thymidine is not more than 1.0 per cent.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.3 per cent.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50.0 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution (a). A solution containing 0.05 per cent w/v of *stavudine RS*, 0.01 per cent w/v of *thymine* and 0.0005 per cent w/v of *â-thymidine* in the mobile phase.

Reference solution (b). A 0.0005 per cent w/v solution of *thymine* in the mobile phase.

Reference solution (c). A 0.05 per cent w/v solution of *stavudine RS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature 50°,
- mobile phase: a mixture of 20 volumes of *methanol* and 80 volumes of *water*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 265 nm,
- injection volume. 20 µl.

Inject separately reference solutions (a) and (c). The order of elution in the chromatogram obtained with reference solution (a) is thymine, α-thymidine and stavudine with relative retention times of about 0.5, 0.7 and 1.0 respectively. The test is not valid unless the column efficiency determined from the stavudine peak in the chromatogram obtained with reference solution (a) is not less than 3000 theoretical plates, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections of reference solution (c) is not more than 2.0 per cent.

Inject separately the test solution and reference solution (c) and measure the responses of the principal peak.

Calculate the content of $C_{10}H_{12}N_2O_4$.

Storage. Store protected from light and moisture.

Stavudine Capsules

Stavudine Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of stavudine, $C_{10}H_{12}N_2O_4$.

Usual strengths. 30 mg; 40 mg.

Identification

A. Shake a quantity of the mixed contents of the capsules containing about 50 mg of Stavudine with 80 ml of *water* for 10 minutes. Add sufficient *water* to produce 100 ml, mix and filter. Dilute 10 ml of the filtrate to 100 ml with *water*.

When examined in the range 200 nm to 300 nm (2.4.7), the resulting solution shows an absorption maximum at about 265 nm.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to stavudine in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Mix well the contents of 20 capsules and transfer an accurately weighed quantity containing about 50 mg of Stavudine to a 100-ml volumetric flask. Add about 60 ml of *water*, mix with the aid of ultrasound for 10 minutes, dilute to volume with *water*, mix and filter.

Reference solution. Weigh 5 mg each of *stavudine RS* and *thymine RS* and transfer to a 25-ml volumetric flask. Add 5 ml of *methanol*, mix with the aid of ultrasound to dissolve and dilute to volume with *water*.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: gradient mixtures of *acetonitrile* and *0.1 M ammonium acetate*,
- flow rate. 1 ml per minute,
- a linear gradient programme using the conditions given below,
- spectrophotometer set at 270 nm,
- injection volume. 20 µl.

Time (in min.)	*0.1 M Ammonium acetate* (per cent v/v)	*Acetonitrile* (per cent v/v)
0	95	5
5	95	5
25	20	80
30	20	80
31	95	5
35	95	5

Inject the reference solution. The test is not valid unless the column efficiency determined from the peaks of stavudine and thymine is not less than 7000 theoretical plates and the tailing factor is not more than 2.0.

Inject separately *water* and the test solution. Examine the water chromatogram for any extraneous peaks and ignore the corresponding peaks observed in the chromatogram obtained with the test solution.

Any secondary peak observed in the chromatogram obtained with the test solution corresponding to thymine is not more than 3.0 per cent. Any other secondary peak observed in the chromatogram obtained with the test solution is not more than 0.5 per cent and the sum of the areas of all the secondary peaks is not more than 4.0 per cent when calculated by percentage area normalisation.

Dissolution (2.5.2).

Apparatus No. 1,

Medium. 900 ml of *0.01 M hydrochloric acid,*

Speed and time. 75 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. The filtrate obtained as given above.

Reference solution. In the case of capsules containing 30 mg of Stavudine, weigh accurately about 30 mg of *stavudine RS* and transfer to a 100-ml volumetric flask. Dissolve and dilute to volume with *0.01 M hydrochloric acid.* Dilute 5.0 ml of this solution to 50.0 ml with *0.01 M hydrochloric acid*; in the case of capsules containing 40 mg of stavudine, weigh accurately about 40 mg of *stavudine RS* and transfer to a 100-ml volumetric flask. Dissolve and dilute to volume with *0.01 M hydrochloric acid.* Dilute 5.0 ml of this solution to 50.0 ml with *0.01 M hydrochloric acid.*

Chromatographic system
- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 85 volumes of *water* and 15 volumes of *methanol,*
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 266 nm,
- injection volume. 20 µl.

Inject the reference solution and record the chromatograms for twice the retention time of stavudine. The test is not valid unless the column efficiency determined from the stavudine peak is not less than 3000 theoretical plates, the tailing factor is not more than 1.5 and the relative standard deviation for replicate injections is not more than 1.5 per cent

Inject separately the test solution and the reference solution and measure the responses for the major peak.

Calculate the content of $C_{10}H_{12}N_2O_4$ in the medium.

D. Not less than 70 per cent of the stated amount of $C_{10}H_{12}N_2O_4$.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh accurately a quantity of the mixed contents of 20 capsules containing about 50 mg of Stavudine and transfer to a 100-ml volumetric flask. Add about 60 ml of *water*, mix with the aid of ultrasound for 10 minutes, dilute to volume with *water*, mix and filter. Further dilute 10.0 ml of the filtrate to 25.0 ml with *water*.

Reference solution. Weigh accurately about 50 mg of *stavudine RS* and transfer to a 100-ml volumetric flask. Add about 60 ml of *water*, mix with the aid of ultrasound to dissolve and dilute to volume with *water*. Dilute 10.0 ml of this solution to 25.0 ml with *water*.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 5 volumes of *acetonitrile* and 95 volumes of *0.1 M ammonium acetate,*

- flow rate. 1 ml per minute,
- spectrophotometer set at 270 nm,
- injection volume. 20 µl

Inject the reference solution. The test is not valid unless the column efficiency determined from the stavudine peak is not less than 3000 theoretical plates, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject separately the test solution and the reference solution and measure the responses for the major peak.

Calculate the content of $C_{10}H_{12}N_2O_4$ in the capsules.

Storage. Store protected from moisture.

Stavudine Oral Solution

Stavudine Oral Solution is a mixture consisting of Stavudine with buffering agents and other excipients. It contains a suitable flavouring agent. It is filled in a sealed container.

The oral solution is constituted by dispersing the contents of the sealed container in the specified volume of water just before issue.

Stavudine Oral Solution contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of stavudine $C_{10}H_{12}N_2O_4$.

Storage. Store the constituted solution in a refrigerator (2° to 8°). Discard any unused portion after 30 days of reconstitution.

The contents of the sealed container comply with the requirements stated under Oral Liquids and with the following requirements.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

pH (2.4.24). 5.0 to 7.0, determined in the reconstituted solution.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Weigh accurately a quantity of the reconstituted solution containing 10 mg of stavudine and dissolve in 20 ml of *water*.

Reference solution (a). A 0.05 per cent w/v solution of *stavudine RS* in *water*.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with *water*.

Reference solution (c). A solution containing 0.0125 per cent w/v each of thymine and thymidine in *water*. Dilute 2 ml of the solution to 100 ml of *water*.

Use the chromatographic system described under Assay.

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 2.0 and the column efficiency in not less than 2000 theoretical plates.

Inject reference solution (c). The test is not valid unless the resolution between thymine and thymidine peak is not less than 8.4.

Inject the test solution and reference solution (b). Run the chromatogram for 4 times the retention time (about 9 minutes) of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 1.5 times the area of the peak in the chromatogram obtained with the reference solution (b) (1.5 per cent) and the sum of areas of all the secondary peaks is not more than 3 times the area of the peak in the chromatogram obtained with the reference solution (b) (3.0 per cent).

Other tests. Complies with the tests stated under Oral Liquids.

Water (2.3.43). Not more than 2.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Weigh accurately a quantity of the reconstituted solution containing 10 mg of Stavudine, disperse in sufficient water and diluted to 100.0 ml with water.

Reference solution (a). A 0.01 per cent w/v solution of *stavudine RS* in *water*.

Reference solution (b). A solution containing 0.0125 per cent w/v each of thymine and thymidine in *water*. Dilute 2 ml of the solution to 100 ml with *water*.

Chromatographic system

- a stainless steel column 3.3 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. 95 volumes of 25 mM *ammonium acetate* and 5 volumes of *methanol*,
  B. 50 volumes of 25 mM *ammonium acetate* and 50 volumes of *methanol*.
- flow rate. 1 ml per minute,
- a linear gradient programme using the conditions given below,
- spectrophotometer set at 268 nm,

– injection volume. 20 µl.

Time (in min.)	mobile phase A (per cent v/v)	mobile phase B (per cent v/v)
0	100	0
60	100	0
120	0	100
155	100	0

Inject reference solution (b). The test is not valid unless the resolution between thymine and thymidine is not less than 8.4.

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 2.0, the column efficiency in not less than 2000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and reference solution (a).

Calculate the content of $C_{10}H_{12}N_2O_4$ in the oral solution.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Stavudine and Lamivudine Tablets

Stavudine and Lamivudine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of stavudine, $C_{10}H_{12}N_2O_4$ and lamivudine, $C_8H_{11}N_3O_3S$.

Usual strengths. Stavudine, 30 mg and Lamivudine, 150 mg; Stavudine, 40 mg and Lamivudine, 150 mg.

Identification

In the Assay, the two principal peaks in the chromatogram obtained with the test solution correspond to the peaks due to stavudine and lamivudine in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Weigh accurately a quantity of the powdered tablets containing about 100 mg of lamivudine and transfer to a 200-ml volumetric flask. Add about 100 ml of *water*, mix with the aid of ultrasound for 10 minutes with occasional shaking to obtain a uniform dispersion, cool to room temperature, dilute to volume with *water* and mix. Filter through a membrane filter disc with an average pore diameter not greater than 1.0 µm, rejecting the first few ml of the filtrate.

Reference solution (a). Weigh accurately about 65 mg of *stavudine RS* and 6.5 mg of *thymine RS*, and transfer to a 25-ml volumetric flask. Add 5 ml of *methanol*, sonicate to dissolve, dilute to volume with *water* and mix.

Reference solution (b). Weigh accurately about 100 mg of *lamivudine RS*, transfer to a 200 ml volumetric flask, add about 100 ml of *water* and mix with the aid of ultrasound to dissolve. Add 10 ml of reference solution (a) to this solution and dilute to volume with *water* and mix.

Chromatographic system

– a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
– mobile phase: gradient mixtures of *acetonitrile* and *0.1 M ammonium acetate*,
– flow rate. 1 ml per minute,
– a linear gradient programme using the conditions given below,
– spectrophotometer set at 270 nm,
– injection volume. 20 µl.

Time (in min.)	*0.1 M Ammonium acetate* (per cent v/v)	*Acetonitrile* (per cent v/v)
0	95	5
5	95	5
25	20	80
30	20	80
31	95	5
35	95	5

Inject separately reference solutions (b) and (c). The test is not valid unless the column efficiency determined from the thymine, stavudine and lamivudine peaks is not less than 3000 theoretical plates and the tailing factor for the same peaks is not more than 2.0.

Inject separately *water* and the test solution. Examine the chromatogram obtained with water for any extraneous peaks and ignore the corresponding peaks observed in the chromatogram obtained with the test solution.

Any secondary peak observed in the chromatogram obtained with the test solution corresponding to thymine is not more than 3.0 per cent. Any other secondary peak observed in the chromatogram obtained with the test solution is not more than 0.5 per cent and the sum of the areas of all the secondary peaks is not more than 4.0 per cent when calculated by percentage area normalisation.

Dissolution (2.5.2).

Apparatus No. 1,
Medium. 900 ml of *0.01 M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14).

Test solution. The filtrate obtained as given above.

Reference solution. In the case of tablets containing 30 mg of stavudine, weigh accurately about 33 mg of *stavudine RS* and 167 mg of *lamivudine RS* and transfer to a 100 ml volumetric flask. Add about 20 ml of *methanol*, sonicate to dissolve and dilute to volume with a solvent mixture of equal volumes of *methanol* and *water* (diluent). Dilute 5.0 ml of this solution to 50.0 ml with *0.01 M hydrochloric acid*; in the case of tablets containing 40 mg of stavudine, weigh accurately about 44 mg of *stavudine RS* and 167 mg of *lamivudine RS* and transfer to a 100-ml volumetric flask. Add about 20 ml of *methanol*, mix with the aid of ultrasound to dissolve and dilute to volume with the diluent. Dilute 5.0 ml of this solution to 50.0 ml with *0.01 M hydrochloric acid.*

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 35 volumes of *methanol* and 65 volumes of a buffer prepared by dissolving 0.68 g of *potassium dihydrogen phosphate* and 1.0 g of *sodium octanesulphonate* in 1000.0 ml of *water* to which 1 ml of *triethylamine* is added and the pH of which is adjusted to 2.5 with *phosphoric acid,*
- flow rate. 1 ml per minute,
- spectrophotometer set at 266 nm,
- injection volume. 10 µl.

Inject the reference solution. The test is not valid unless the column efficiency determined from the lamivudine peak is not less than 2000 theoretical plates, the tailing factor for the individual stavudine and lamivudine peaks is not more than 1.5 and the relative standard deviation for replicate injections for each of the peaks corresponding to stavudine and lamivudine is not more than 1.0 per cent.

Inject separately the test solution and the reference solution and measure the responses for the major peaks due to stavudine and lamivudine.

Calculate the contents of $C_{10}H_{12}N_2O_4$ and $C_8H_{11}N_3O_3S$ in the medium.

D. Not less than 70 per cent of the stated amounts of $C_{10}H_{12}N_2O_4$ and $C_8H_{11}N_3O_3S$.

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh and powder 20 tablets. Transfer an accurately weighed quantity of the powder containing about 150 mg of Lamivudine to a 100-ml volumetric flask, add about 20 ml of *methanol* and 50 ml of a mixture of equal volumes of *water* and *methanol*, mix with the aid of ultrasound for 5 minutes with occasional shaking to obtain a uniform dispersion. Cool to room temperature and dilute to volume with the same solvent mixture. Filter the solution through a membrane filter disc with an average pore diameter not greater than 1.0 µm, rejecting the first few ml of the filtrate. Dilute suitably with the same solvent mixture to obtain a solution with a concentration of 0.15 mg per ml of lamivudine.

Reference solution. A similarly prepared solution containing 0.015 per cent w/v of *lamivudine RS* and a concentration of *stavudine RS* similar to that of the concentration of stavudine in test solution.

Use the chromatographic system described under Dissolution.

Inject the reference solution. The test is not valid unless the column efficiency determined from the lamivudine peak is not less than 2000 theoretical plates, the tailing factor for the individual peaks due to lamivudine and stavudine is not more than 1.5 and the relative standard deviation for replicate injections for each of the peaks corresponding to stavudine and lamivudine is not more than 2.0 per cent.

Inject separately the test solution and the reference solution and measure the responses for the major peaks.

Calculate the contents of $C_{10}H_{12}N_2O_4$ and $C_8H_{11}N_3O_3S$ in the tablets.

Storage. Store protected from moisture.

Stearic Acid

Stearic Acid consists of a mixture of fatty acids, chiefly stearic acid ($C_{18}H_{36}O_2$) and palmitic acid ($C_{16}H_{32}O_2$). It may contain a suitable antioxidant.

Stearic Acid contains not less than 40.0 per cent of $C_{18}H_{36}O_2$ and the sum of the contents of $C_{18}H_{36}O_2$ and $C_{16}H_{32}O_2$ is not less than 90.0 per cent.

Category. Pharmaceutical aid (tablet lubricant; emulsion adjunct).

Description. A white powder or white, greasy, flaky crystals or hard masses showing signs of crystallisation.

Identification

In the Assay, the chromatogram obtained with the test solution shows two principal peaks which correspond to the two principal peaks in the chromatogram obtained with reference solution (c).

Tests

Congealing temperature (2.4.10). Not lower than 54°.

Acid value (2.3.23). 200 to 212, determined on 1.0 g.

Iodine value (2.3.28). Not more than 4.0 *(iodine monochloride method)*.

Mineral acid. Shake 5 g of the melted substance with an equal volume of hot *water* for 2 minutes, cool and filter. To the filtrate add 0.05 ml of *methyl orange solution*; no red colour is produced.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent, determined on 2.0 g.

Assay. Determine by gas chromatography (2.4.13).

Test solution. Add 5 ml of *boron trifluoride solution* to 0.1 g of the substance under examination and heat under a reflux condenser for 15 minutes, cool and transfer to a separating funnel with the aid of 10 ml of *hexane*. Add 10 ml of a saturated solution of *sodium chloride* and 10 ml of *water*, shake, discard the lower aqueous layer and dry the upper layer over *anhydrous sodium sulphate*.

Reference solution (a). Add 5 ml of a 1 per cent w/v solution of *nonadecanoic acid* (internal standard) in *toluene* to a mixture of 50 mg of *stearic acid RS* and 50 mg of *palmitic acid RS* and evaporate to dryness. Add 5 ml of *boron trifluoride solution* and complete the procedure described for the test solution beginning at the words "heat under a reflux condenser...."..

Reference solution (b). Add 5 ml of the internal standard solution to 0.1 g of the substance under examination, evaporate to dryness, add 5 ml of *boron trifluoride solution* and complete the procedure described for the test solution beginning at the words "heat under a reflux condenser.....".

Reference solution (c). Prepare in the same manner as reference solution (a) but omitting the internal standard.

Chromatographic system
- a glass column 1.5 m × 4 mm, packed with acid-washed, silanised diatomaceous support (100 to 120 mesh) coated with 15 per cent w/w of *diethylene glycol succinate polyester*,
- temperature: column 170°, inlet port and detector at 240°,
- flow rate. 30 ml per minute of the carrier gas.

Calculate the content of $C_{18}H_{36}O_2$, and $C_{16}H_{32}O_2$.

Storage. Store protected from moisture.

Stearyl Alcohol

Stearyl Alcohol is a mixture of solid alcohols consisting chiefly of 1-octadecanol, ($C_{18}H_{38}O$).

Category. Pharmaceutical aid (stiffening agent).

Description. A white, unctuous mass or almost white flakes or granules; odour, faint and characteristic.

Tests

Appearance of solution. Dissolve 0.5 g in 20 ml of *ethanol (95 per cent)* by heating to boiling and allow to cool. The solution is clear (2.4.1), and not more intensely coloured than reference solution BS6 (2.4.1).

Melting range (2.4.21). 55° to 60°.

Acid value (2.3.23). Not more than 2.0.

Hydroxyl value (2.3.27). 195 to 220.

Iodine value (2.3.28). Not more than 2.0 *(iodine bromide method)*, determined on 2.0 g dissolved in 25 ml of *chloroform*, warming if necessary to effect solution.

Saponification value (2.3.37). Not more than 2.0, determined on 10.0 g.

Assay. Determine by gas chromatography (2.4.13).

Test solution. Dissolve 0.1 g of the substance under examination in 10.0 ml of *ethanol (95 per cent)*.

Reference solution (a). Dissolve 50 mg of *cetyl alcohol* in 10.0 ml of *ethanol (95 per cent)*.

Reference solution (b). Dissolve 50 mg of *stearyl alcohol RS* in 5.0 ml of *ethanol (95 per cent)*.

Reference solution (c). To 1.0 ml of reference solution (a), add 1.0 ml of reference solution (b) and dilute to 10.0 ml with *ethanol (95 per cent)*.

Chromatographic system
- a stainless steel column 30 m x 0.32 mm, packed with poly(dimethyl)siloxane (1 µm),
- temperature:

	Time (min)	Temperature (°)
Column	0–20	150–250
	20–40	250

- injector port and detector at 250°,
- flame ionization detector,
- flow rate. 1 ml per minute using nitrogen as the carrier gas.

Inject reference solution (c). The test is not valid unless the resolution between the peaks due to cetyl alcohol and stearyl alcohol is not less than 5.0.

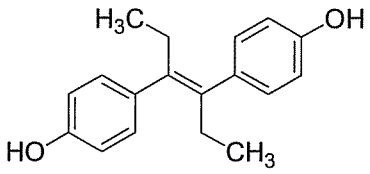
Inject 1 µl of the test solution, reference solution (b) and (c).

Calculate the content of $C_{18}H_{38}O$.

Storage. Store protected from moisture.

Stilboestrol

Diethylstilboestrol



$C_{18}H_{20}O_2$ Mol. Wt. 268.4

Stilboestrol is (*E*)-α,β-diethylstilbene-4,4'-diol.

Stilboestrol contains not less than 97.0 per cent and not more than 101.0 per cent of $C_{18}H_{20}O_2$, calculated on the dried basis.

Category. Oestrogen.

Dose. In the treatment of menopausal symptoms, 100 µg to 1 mg daily; for the suppression of lactation, 5 mg thrice daily for 3 days, followed by 5 mg daily for 6 days; in the treatment of carcinoma of the prostate and mammary carcinoma, 10 to 20 mg daily.

Description. A white or almost white, crystalline powder; odourless.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *stilboestrol RS* or with the reference spectrum of stilboestrol.

B. When examined in the range 230 nm to 450 nm (2.4.7), the irradiated solution prepared as directed in the Assay shows absorption maxima at about 292 nm and 418 nm.

C. In the test for Mono- and di-methyl ethers, the principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a).

D. Dissolve 0.5 mg in 0.2 ml of *glacial acetic acid*, add 1 ml of *phosphoric acid* and heat in a water-bath for 3 minutes; a deep yellow colour is produced which almost disappears on dilution with 3 ml of *glacial acetic acid* (distinction from dienoestrol).

Tests

4,4'-Dihydroxystilben and related ethers. Absorbance of a 1.0 per cent w/v solution in *ethanol* at about 325 nm, not more than 0.50 (2.4.7).

Mono- and di-methyl ethers. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel*.

Mobile phase. A mixture of 90 volumes of *toluene* and 10 volumes of *diethylamine*.

Test solution. Dissolve 0.5 g of the substance under examination in 100 ml of *ethanol (95 per cent)*.

Reference solution (a). A 0.5 per cent w/v solution of *stilboestrol RS in ethanol (95 per cent)*.

Reference solution (b). A 0.05 per cent w/v solution of *stilboestrol monomethyl ether RS* in *ethanol (95 per cent)*.

Reference solution (c). A 0.05 per cent w/v solution of *stilboestrol dimethyl ether RS* in *ethanol (95 per cent)*.

Reference solution (d). A solution containing 0.25 per cent w/v each of *dienoestrol RS* and *stilboestrol RS*

Apply to the plate 1 µl of each solution. After development, dry the plate in air, spray with *ethanolic sulphuric acid (20 per cent)* and heat at 120° for 10 minutes. Any secondary spots in the chromatogram obtained with the test solution corresponding to the mono-and di-methyl ethers of stilboestrol are not more intense than the spots in the chromatograms obtained with reference solutions (b) and (c) respectively. Stilboestrol sometimes produces two spots. The test is not valid unless the chromatogram obtained with reference solution (d) shows two clearly separated spots of approximately the same intensity.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 20 mg, dissolve in sufficient *ethanol* to produce 100.0 ml and dilute 10.0 ml of this solution to 100.0 ml with *ethanol*. To 25.0 ml of the resulting solution add 25.0 ml of a solution prepared by dissolving 1 g of *dipotassium hydrogen phosphate* in 55 ml of *water*, transfer a portion of the mixture to a 1-cm closed quartz cell, place the cell 10 cm from a 15-watt short-wave, ultraviolet light of mercury lamp and irradiate for 10 minutes. Measure the absorbance of the irradiated solution at the maximum at about 418 nm (2.4.7).

Calculate the content of $C_{18}H_{20}O_2$ from the absorbance obtained by repeating the operation using *stilboestrol RS* in place of the substance under examination.

Storage. Store protected from light and moisture.

Stilboestrol Tablets

Diethylstilboestrol Tablets

Stilboestrol Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of stilboestrol, $C_{18}H_{20}O_2$.

Usual strengths. 500 µg; 1 mg; 5 mg; 25 mg.

Identification

A. When examined in the range 230 nm to 450 nm (2.4.7), the irradiated solution prepared as directed in the Assay shows absorption maxima at about 292 nm and 418 nm.

B. Extract a quantity of the powdered tablets containing 3 mg of Stilboestrol with *ether*, filter and evaporate the filtrate to dryness. Dissolve 0.5 mg of the residue in 0.2 ml of *glacial acetic acid*, add 1 ml of *phosphoric acid* and heat in a water-bath for 3 minutes; a deep yellow colour is produced which almost disappears on dilution with 3 ml of *glacial acetic acid* (distinction from dienoestrol).

Tests

Uniformity of content. *For tablets containing 10 mg or less* — Comply with the test stated under Tablets.

Finely crush one tablet, add 10 ml of *ethanol*, shake for 30 minutes, add sufficient *ethanol* to produce 25.0 ml and centrifuge. Pipette an aliquot of the supernatant liquid containing 0.5 mg of Stilboestrol add 25.0 ml of a solution prepared by dissolving 1 g of *dipotassium hydrogen phosphate* in 55 ml of *water*, transfer a portion of the mixture to a 1-cm closed quartz cell, place the cell 10 cm from a 15-watt short-wave, ultraviolet light of mercury lamp and irradiate for 10 minutes. Measure the absorbance of the irradiated solution at the maximum at about 418 nm (2.4.7).

Calculate the content of $C_{18}H_{20}O_2$ in the tablet from the absorbance obtained by repeating the operation using *stilboestrol RS* in place of the substance under examination.

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 5 mg of Stilboestrol, add 5 ml of *ethanol*, shake for 15 minutes, add sufficient *ethanol* to produce 100.0 ml and centrifuge. Dilute 20.0 ml of the clear, supernatant liquid to 50.0 ml with *ethanol* and mix. To 25.0 ml of the resulting solution, add 25.0 ml of a solution prepared by dissolving 1 g of *dipotassium hydrogen phosphate* in 55 ml of *water*, transfer a portion of the mixture to a 1-cm closed quartz cell, place the cell 10 cm from a 15-watt short-wave, ultraviolet light of mercury lamp and irradiate for 10 minutes. Measure the absorbance of the irradiated solution at 418 nm (2.4.7).

Calculate the content of $C_{18}H_{20}O_2$ in the tablet from the absorbance obtained by repeating the operation using *stilboestrol RS* in place of the substance under examination.

Storage. Store protected from light and moisture.

Streptokinase

Streptokinase is a preparation of a protein obtained from culture filtrates of certain strains of *Streptococcus haemolyticus* group C. It has the property of combining with human plasminogen to form plasminogen activator and is purified to contain not less than 600 Units of Streptokinase activity per µg of nitrogen before addition of any stabiliser or carrier. It usually contains a buffer and may be stabilised by the addition of suitable substances such as Human Albumin.

Category. Fibrinolytic enzyme.

Dose. By intravenous infusion, 250,000 to 600,000 Units over 30 minutes followed by 100,000 Units every hour for upto 1 week.

Description. A white powder or a white, friable solid; hygroscopic.

Identification

A. Place 0.5 ml of citrated human, canine or rabbit plasma in a haemolysis tube maintained in a water-bath at 37°. Add 0.1 ml of a solution of the substance under examination containing 10,000 Units per ml in *citro-phosphate buffer pH 7.2* and 0.1 ml of a solution of *thrombin* containing 20 Units per ml in *citro-phosphate buffer pH 7.2* and shake immediately; a clot forms and lyses within 30 minutes. Repeat the procedure using citrated bovine plasma; lysis does not occur within 1 hour.

B. Dissolve 0.6 g of *agar* in 50.0 ml of *mixed barbitone buffer pH 8.6*, heating until a clear solution is obtained. Place glass plates (50 mm x 50 mm) that are free from traces of grease on a level surface. Apply to each plate 4 ml of the agar solution and allow to cool until set. Bore a hole 6 mm in diameter in the centre of the agar and an appropriate number of holes (not exceeding six) at distances of 11 mm from the central hole removing the residual agar by means of a cannula connected to a vacuum pump. Place a quantity of 80 µl of goat or rabbit antistreptokinase serum containing 10,000 Units of antistreptokinase activity per ml in the central hole and 80 µl of a solution of the substance under examination containing 125,000 Units of streptokinase activity per ml of each of the surrounding holes. Place the plates in a humidified tank for 24 hours.

Only one precipitation arc is produced which is well-defined and localised between the application point of the serum and each hole containing the solution of the substance under examination.

Tests

pH (2.4.24). 6.8 to 7.5, determined on a solution prepared in freshly boiled and cooled *water* containing 5000 Units per ml.

Streptodornase. Introduce 0.5 ml of a 0.1 per cent w/v solution of *sodium deoxyribonucleate* in *imidazole buffer pH 6.5* into each of eight centrifuge tubes. To each of the first two tubes add 0.25 ml of *imidazole buffer pH 6.5* and 0.25 ml of solution of the substance under examination in *imidazole buffer pH 6.5* containing 150,000 Units per ml (solution A) followed immediately by 3.0 ml of *0.25 M perchloric acid.* Mix the contents of each tube, centrifuge for 5 minutes at 3000 rpm and measure the absorbance of each of the supernatant liquids at about 260 nm (2.4.7), using as the blank a mixture of 1.0 ml of *imidazole buffer pH 6.5* and 3.0 ml of *0.25 M perchloric acid.* Calculate the sum of the two absorbances (A_1). To each of the remaining six tubes add, respectively, 0.25, 0.25, 0.125, 0.125, 0 and 0 ml of *imidazole buffer pH 6.5* followed by 0.25 ml of solution A and finally 0, 0, 0.125, 0.125, 0.25 and 0.25 ml respectively of a solution of the Standard Preparation containing 20 Units of streptodornase activity per ml in *imidazole buffer pH 6.5.* [The Standard Preparation is the 1st International Standard Preparation for Streptodornase, established in 1964, consisting of a freeze-dried mixture of streptodornase and streptokinase with lactose (supplied in ampoules containing 2400 Units of streptodornase activity), or another suitable preparation the activity of which has been determined in relation to the International Standard]. Mix the contents of each tube, incubate at 37° for 15 minutes and add to each tube 3.0 ml of *0.25 M perchloric acid.* Mix the contents of each tube, centrifuge and measure the absorbance of each of the supernatant liquids at about 260 nm (2.4.7), using as the blank the mixture specified above. If the sum of the absorbances of the liquids in the third and fourth tubes is A_2, that of the liquids in the fifth and six tubes is A_3, and that of the liquids in the seventh and eighth tubes is (A_4), (A_1–A_2) is less than $0.5(A_3+A_4)–A_2$.

Streptolysin. Dissolve a quantity of the substance under examination containing 500,000 Units in 0.5 ml of a mixture of 90 volumes of *saline solution* and 10 volumes of *citro-phosphate buffer pH 7.2* in a haemolysis tube. Add 0.4 ml of a 2.3 per cent w/v solution of *sodium thioglycollate* and incubate in a water-bath at 37° for 10 minutes. Add 0.1 ml of a solution of a reference preparation of human antistreptolysin O containing 5 Units per ml and incubate at 37° for 5 minutes. Add 1 ml of *rabbit erythrocyte suspension*, continue the incubation for 30 minutes and centrifuge at about 1000 rpm. The absorbance of the supernatant liquid at about 550 nm (2.4.7), is not more than 1.5 times the absorbance obtained by repeating the above procedure using 0.5 ml of the mixture of saline solution and citro-phosphate buffer pH 7.2 in place of the solution containing the substance under examination.

Loss on drying (2.4.19). Not more than 4.0 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* at a pressure not exceeding 2.7 kPa for 24 hours.

Assay. The potency of streptokinase is determined by comparing its ability to activate human plasminogen to form plasmin with that of the Standard Preparation. The plasmin generated is determined by measurement of the time taken to lyse a fibrin clot under the conditions of a suitable method of assay.

Standard Preparation

The Standard Preparation is the 2nd International Standard for Streptokinase, established in 1989, consisting of freeze-dried streptokinase (supplied in ampoules containing 700 Units of streptokinase activity), or another suitable preparation the activity of which has been determined in relation to the International reference preparation.

Method

Use *citro-phosphate buffer pH 7.2* containing 3 per cent w/v of *bovine serum albumin* for the preparation of solutions and dilutions.

Prepare a solution of the Standard Preparation to contain 1000 Units of streptokinase activity per ml and prepare a solution of the preparation under examination expected to have the same concentration; keep the solutions in ice and use within 6 hours. Prepare three 1.5-fold serial dilutions of the solution of the Standard Preparation so that the longest clot-lysis time is less than 20 minutes and prepare three similar dilutions of the solution of the preparation under examination. Keep the solutions in ice and use within 1 hour. Using 24 tubes, 8 mm in diameter, label the tubes S_1, S_2, S_3 for the dilutions of the Standard Preparation and T_1, T_2, T_3 for the dilutions of the preparation under examination, allocating four tubes to each dilution. Place the tubes in ice. Into each tube introduce 0.2 ml of the appropriate dilution, 0.2 ml of *citro-phosphate buffer pH 7.2* containing 3 per cent w/v of *bovine serum albumin* and 0.1 ml of a solution containing 20 Units of *thrombin* per ml. Place the tubes in a water-bath at 37° and allow to stand for 2 minutes to attain temperature equilibrium. Using an automatic pipette, introduce into the bottom of the first tube 0.5 ml of a 1 per cent w/v solution to *human euglobulins* ensuring mixing. At 5-second intervals introduce successively into the remaining tubes 0.5 ml of a 1 per cent w/v solution of human euglobulins. Using a stop-watch, measure for each tube the time in seconds that elapses between the addition of the euglobulin and the lysis of the clot.

Using the logarithms of the lysis times, calculate the result of the assay by standard statistical methods.

The estimated potency is not less than 90 per cent and not more than 111 per cent of the stated potency. The fiducial limits of error are not less than 80 per cent and not more than 125 per cent of the stated potency.

Streptokinase intended for use in the manufacture of parenteral preparations complies with the following additional requirements.

Abnormal toxicity (2.2.1). Determine by Method A, using a solution containing 50,000 Units in 0.5 ml of *water for injections administered* in 15 to 20 seconds.

Bacterial endotoxins (2.2.3). Dissolve the contents of the sealed container in *water BET* to give a solution containing 10,000 Units of Streptokinase per ml. Carry out the test on the resulting solution; the maximum allowable endotoxin concentration of the solution is 23.33 Units of endotoxin per ml. Carry out the test using the maximum valid dilution of the prepared solution calculated from the declared sensitively of the lysate used in the test.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store in sealed containers, protected from light. The containers should be sterile, tamper-evident and sealed so as to exclude micro-organisms. Under these conditions the contents may be expected to retain their potency for 2 years.

Labelling. The label states (1) the number of Units of streptokinase activity in the container; (2) the number of Units of streptokinase activity per mg, calculated with reference to the dried preparation; (3) the name and quantity of any added substances; (4) the storage conditions; (5) whether or not it is intended for use in the manufacture of parenteral preparations.

Streptokinase Injection

Streptokinase Injection is a sterile material consisting of Streptokinase with or without auxiliary agents. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Usual strengths. 50,000 Units; 100,000 Units; 750,000 Units; 1,500,000 Units.

Identification

A. Place 0.5 ml of citrated human, canine or rabbit plasma in a haemolysis tube maintained in a water-bath at 37°. Add 0.1 ml of a solution of the contents of the container containing 10,000 Units per ml in *citro-phosphate buffer pH 7.2* and 0.1 ml of a solution of *thrombin* containing 20 Units per ml in *citro-phosphate buffer pH 7.2* and shake immediately; a clot forms and lyses within 30 minutes. Repeat the procedure using citrated bovine plasma; lysis does not occur within 1 hour.

B. Dissolve 0.6 g of *agar* in 50.0 ml of *mixed barbitone buffer pH 8.6*, heating until a clear solution is obtained. Place glass plates (50 mm x 50 mm) that are free from traces of grease on a level surface. Apply to each plate 4 ml of the agar solution and allow to cool until set. Bore a hole 6 mm in diameter in the centre of the agar and an appropriate number of holes (not exceeding six) at distances of 11 mm from the central hole removing the residual agar by means of a cannula connected to a vacuum pump. Place a quantity of 80 µl of goat or rabbit antistreptokinase serum containing 10,000 Units of antistreptokinase activity per ml in the central hole and 80 µl of a solution of the contents of the container containing 125,000 Units of streptokinase activity per ml of each of the surrounding holes. Place the plates in a humidified tank for 24 hours.

Only one precipitation arc is produced which is well-defined and localised between the application point of the serum and each hole containing the solution of the substance under examination.

Tests

pH (2.4.24). 6.8 to 7.5, determined on a freshly constituted injection containing 5000 Units per ml.

Streptodornase. Introduce 0.5 ml of a 0.1 per cent w/v solution of *sodium deoxyribonucleate* in *imidazole buffer pH 6.5* into each of eight centrifuge tubes. To each of the first two tubes add 0.25 ml of *imidazole buffer pH 6.5* and 0.25 ml of solution of the contents of the container with the substance under examination in *imidazole buffer pH 6.5* containing 150,000 Units per ml (solution A) followed immediately by 3.0 ml of *0.25 M perchloric acid*. Mix the contents of each tube, centrifuge for 5 minutes at 3000 rpm and measure the absorbance of each of the supernatant liquids at about 260 nm (2.4.7), using as the blank a mixture of 1.0 ml of *imidazole buffer pH 6.5* and 3.0 ml of *0.25 M perchloric acid*. Calculate the sum of the two absorbances (A_1). To each of the remaining six tubes add, respectively, 0.25, 0.25, 0.125, 0.125, 0 and 0 ml of *imidazole buffer pH 6.5* followed by 0.25 ml of solution A and finally 0, 0, 0.125, 0.125, 0.25 and 0.25 ml respectively of a solution of the Standard Preparation containing 20 Units of streptodornase activity per ml in *imidazole buffer pH 6.5*.

[The Standard Preparation is the 1st International Standard Preparation for Streptodornase, established in 1964, consisting of a freeze-dried mixture of streptodornase and streptokinase with lactose (supplied in ampoules containing 2400 Units of streptodornase activity), or another suitable preparation the activity of which has been determined in relation to the International Standard]. Mix the contents of each tube, incubate at 37° for 15 minutes and add to each tube 3.0 ml of *0.25 M perchloric acid*. Mix the contents of each tube, centrifuge and measure the absorbance of each of the supernatant liquids at about 260 nm (2.4.7), using as the blank the mixture specified above. If the sum of the absorbances of the liquids in the third and fourth tubes is A_2, that of the liquids in the fifth and six tubes is A_3, and that of the liquids in the seventh and eighth tubes is (A_4), (A_1–A_2) is less than $0.5(A_3+A_4)–A_2$.

Streptolysin. Dissolve a quantity of the contents of the container containing 500,000 Units in 0.5 ml of a mixture of 90 volumes of *saline solution* and 10 volumes of *citro-phosphate buffer pH 7.2* in a haemolysis tube. Add 0.4 ml of a 2.3 per cent w/v solution of *sodium thioglycollate* and incubate in a water-bath at 37° for 10 minutes. Add 0.1 ml of a solution of a reference preparation of human antistreptolysin O containing 5 Units per ml and incubate at 37° for 5 minutes. Add 1 ml of *rabbit erythrocyte suspension*, continue the incubation for 30 minutes and centrifuge at about 1000 rpm. The absorbance of the supernatant liquid at about 550 nm (2.4.7), is not more than 1.5 times the absorbance obtained by repeating the above procedure using 0.5 ml of the mixture of saline solution and citro-phosphate buffer pH 7.2 in place of the solution containing the substance under examination.

Bacterial endotoxins (2.2.3). Dissolve the contents of the sealed container in *water BET* to give a solution containing 10,000 Units of Streptokinase per ml. Carry out the test on the resulting solution; the maximum allowable endotoxin concentration of the solution is 23.33 Units of endotoxin per ml. Carry out the test using the maximum valid dilution of the prepared solution calculated from the declared sensitively of the lysate used in the test.

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. Determine on the mixed contents of ten containers.

The potency of streptokinase is determined by comparing its ability to activate human plasminogen to form plasmin with that of the Standard Preparation. The plasmin generated is determined by measurement of the time taken to lyse a fibrin clot under the conditions of a suitable method of assay.

Standard Preparation

The Standard Preparation is the 2nd International Standard for Streptokinase, established in 1989, consisting of freeze-dried streptokinase (supplied in ampoules containing 700 Units of streptokinase activity), or another suitable preparation the activity of which has been determined in relation to the International reference preparation.

Method

Use *citro-phosphate buffer pH 7.2* containing 3 per cent w/v of *bovine serum albumin* for the preparation of solutions and dilutions.

Prepare a solution of the Standard Preparation to contain 1000 Units of streptokinase activity per ml and prepare a solution of the contents of the container expected to have the same concentration; keep the solutions in ice and use within 6 hours. Prepare three 1.5-fold serial dilutions of the solution of the Standard Preparation so that the longest clot-lysis time is less than 20 minutes and prepare three similar dilutions of the solution of the preparation under examination. Keep the solutions in ice and use within 1 hour. Using 24 tubes, 8 mm in diameter, label the tubes S_1, S_2, S_3 for the dilutions of the Standard Preparation and T_1, T_2, T_3 for the dilutions of the preparation under examination, allocating four tubes to each dilution. Place the tubes in ice. Into each tube introduce 0.2 ml of the appropriate dilution, 0.2 ml of *citro-phosphate buffer pH 7.2* containing 3 per cent w/v of *bovine serum albumin* and 0.1 ml of a solution containing 20 Units of *thrombin* per ml. Place the tubes in a water-bath at 37° and allow to stand for 2 minutes to attain temperature equilibrium. Using an automatic pipette, introduce into the bottom of the first tube 0.5 ml of a 1 per cent w/v solution to *human euglobulins* ensuring mixing. At 5-second intervals introduce successively into the remaining tubes 0.5 ml of a 1 per cent w/v solution of human euglobulins. Using a stop-watch, measure for each tube the time in seconds that elapses between the addition of the euglobulin and the lysis of the clot.

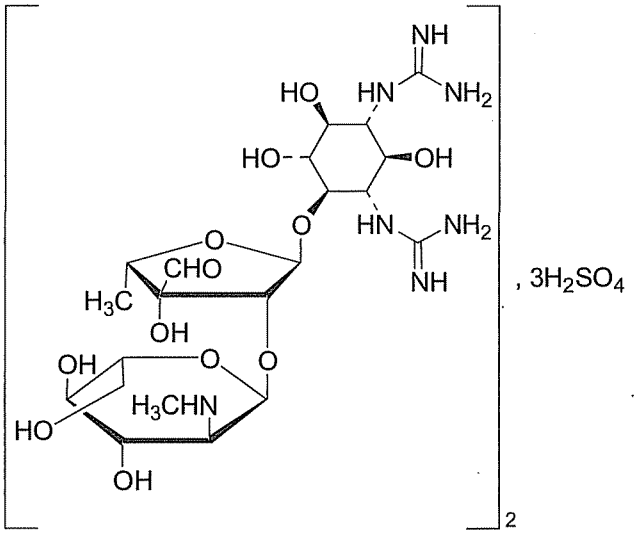
Using the logarithms of the lysis times, calculate the result of the assay by standard statistical methods.

The estimated potency is not less than 90 per cent and not more than 111 per cent of the stated potency. The fiducial limits of error are not less than 80 per cent and not more than 125 per cent of the stated potency.

Storage. Store in sealed containers, protected from light in a refrigerator (2° to 8°). The containers should be sterile and sealed so as to exclude micro-organisms. Under these conditions the contents may be expected to retain their potency for 2 years.

Labelling. The label states the total number of Units of streptokinase activity contained in it.

Streptomycin Sulphate



$(C_{21}H_{39}N_7O_{12})_2,3H_2SO_4$ Mol. Wt. 1457.4

Streptomycin Sulphate is the sulphate of *O*-2-deoxy-2-methylamino-α-L-glucopyranosyl-(1→2)-*O*-5-deoxy-3-*C*-formyl-α-L-lyxofuranosyl-(1→4)-N^1,N^3-diamidino-D-streptamine, a substance produced by the growth of certain strains of *Streptomyces griseus* or obtained by any other means.

Streptomycin Sulphate has a potency equivalent to not less than 700 µg and not more than 850 µg of streptomycin per mg. It contains not less than 90.0 per cent of the stated amount of streptomycin, $C_{21}H_{39}N_7O_{12}$, calculated on the dried basis.

Category. Antitubercular.

Dose. By intramuscular injection, the equivalent of 500 mg to 1 g of streptomycin daily, or at longer intervals.

Description. A white or almost white powder; odourless or with slight odour; hygroscopic.

Identification

A. Determine by thin-layer chromatography (2.4.17). Prepare the plate by mixing 0.3 g of *carbomer* with 240 ml of *water*, allowing to stand with moderate stirring for 1 hour, adjusting the pH to 7.0 by the gradual addition with constant shaking of *2 M sodium hydroxide* and adding 30 g of *silica gel H*. Spread a uniform layer of the resulting suspension 0.75 mm thick. Heat the plate at 110° for 1 hour, allow to cool and use immediately.

Mobile phase. A 7 per cent w/v solution of *potassium dihydrogen phosphate*.

Test solution. Dissolve 0.1 g of the substance under examination in 100 ml of *water*.

Reference solution (a). A 0.1 per cent w/v of *streptomycin sulphate RS* in *water*.

Reference solution (b). A solution containing 0.1 per cent w/v of *streptomycin sulphate RS*, 0.1 per cent w/v of *neomycin sulphate RS* and 0.1 per cent w/v of *kanamycin monosulphate RS* in *water*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in warm air, spray with a mixture of equal volumes of a 0.2 per cent w/v solution of *naphthalene-1,3-diol* in *ethanol (95 per cent)* and *sulphuric acid (45 per cent)* and heat at 150° for 5 to 10 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.

B. Dissolve 5 to 10 mg in 4 ml of *water* and add 1 ml of *1 M sodium hydroxide*. Heat in a water-bath for 4 minutes. Add a slight excess of *2 M hydrochloric acid* and 0.1 ml of a 10 per cent w/v solution of *ferric chloride*; a violet colour is produced.

C. Dissolve 0.1 g in 2 ml of *water* and add 1 ml of *dilute 1-naphthol solution* and 2 ml of a mixture of equal volumes of *dilute sodium hypochlorite solution* and *water*; a red colour is produced.

D. Dissolve 10 mg in 5 ml of water and add 1 ml of *1 M hydrochloric acid*. Heat in a water-bath for 2 minutes. Add 2 ml of a 0.5 per cent w/v solution of *1-naphthol* in *1 M sodium hydroxide* and heat in a water-bath for 1 minute; a faint yellow colour is produced.

E. Gives the reactions of sulphates (2.3.1).

Tests

Appearance of solution. A 25.0 per cent w/v solution in *carbon dioxide-free water* is not more intensely coloured than degree 3 of the appropriate range of reference solutions (2.4.1). The solution, after standing protected from light at a temperature of about 20° for 24 hours, is not more opalescent than opalescence standard OS2 (2.4.1).

pH (2.4.24). 4.5 to 7.0, determined in a 25.0 per cent w/v solution.

Sulphates. 18.0 to 21.5 per cent, calculated on the dried basis, when determined by the following method. Dissolve 0.25 g in 100 ml of *water*, adjust the pH to 11 with *strong ammonia solution* and add 10.0 ml of *0.1 M barium chloride* and 0.5 mg of *metalphthalein*. Titrate the excess of barium chloride with *0.1 M disodium edetate*, adding 50 ml of *ethanol (95 per cent)* when the colour of the solution begins to change and continuing the titration until the violet-blue colour disappears.

1 ml of *0.1 M barium chloride* is equivalent to 0.009606 g of sulphate, SO_4.

Colorimetric test. Dissolve 0.1 g in sufficient *water* to produce 100 ml. To 5 ml, add 5 ml of *0.2 M sodium hydroxide* and heat in a water-bath for exactly 10 minutes. Cool in ice for exactly 5 minutes, add 3 ml of a 1.5 per cent w/v solution of *ferric ammonium sulphate* in *0.25 M sulphuric acid* and sufficient *water* to produce 25 ml and mix. Exactly 20 minutes after the addition of the *ferric ammonium sulphate solution*, measure the absorbance of a 2-cm layer of the solution at the maximum at about 525 nm (2.4.7), using as the blank a solution prepared in the same manner but omitting the substance under examination. The absorbance is not less than 90.0 per cent of that obtained by carrying out the procedure at the same time and in the same manner using *streptomycin sulphate RS* in place of the substance under examination, each absorbance being calculated on the dried basis.

Streptomycin B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 50 volumes of *toluene*, 25 volumes of *glacial acetic acid* and 25 volumes of *methanol*.

Test solution. Dissolve 0.2 g of the substance under examination in 5 ml of a freshly prepared mixture of 97 volumes of *methanol* and 3 volumes of *sulphuric acid*, heat under a reflux condenser for 1 hour, cool, wash down the condenser with *methanol* and add sufficient *methanol* to produce 20 ml.

Reference solution. Dissolve 36 mg of *D-mannose* in 5 ml of a freshly prepared mixture of 97 volumes of *methanol* and 3 volumes of *sulphuric acid*, heat under a reflux condenser for 1 hour, cool, wash down the condenser with *methanol* and add sufficient *methanol* to produce 50 ml. Dilute 5 ml of the resulting solution to 50 ml with *methanol*; this solution contains the equivalent of 0.03 per cent w/v of streptomycin B (1 mg of D-mannose is equivalent to 4.13 mg of streptomycin B).

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 13 to 15 cm. Dry the plate in air, and spray with a freshly prepared mixture of equal volumes of a 0.2 per cent w/v solution of *naphthalene-1,3-diol* in *ethanol (95 per cent)* and a 20 per cent v/v solution of *sulphuric acid* and heat at 110° for 5 minutes. Any spot in the chromatogram obtained with the test solution is not more intense than the corresponding spot in the chromatogram with the reference solution.

Methanol. Determine by gas chromatography (2.4.13).

Test solution. A 4 per cent w/v solution of the substance under examination in *water*.

Reference solution. A 0.012 per cent w/v solution of *methanol* in *water*.

Chromatographic system
- a glass column 1.5 to 2.0 m × 2 to 4 mm, packed with ethylvinylbenzene-divinylbenzene copolymer (150 to 180 µm) porous polymer beads (such as Porapak Q),
- temperature: column 120° to 140°, inlet port and detector at least 50° higher than that of the column,
- flow rate. 30 to 40 ml per minute of the carrier gas.

The area of any peak corresponding to methanol in the chromatogram obtained with the test solution is not greater than that of the peak in the chromatogram obtained with reference solution (0.3 per cent).

Sulphated ash (2.3.18). Not more than 1.0 per cent.

Loss on drying (2.4.19). Not more than 7.0 per cent, determined on 1.0 g by drying over *phosphorus pentoxide* at 60° at a pressure not exceeding 0.1 kPa for 24 hours.

Assay. Determine by the microbiological assay of antibiotics, Method A or B (2.2.10), and express the results in µg of streptomycin per mg.

Streptomycin Sulphate intended for use in the manufacture of parenteral preparations without a further appropriate procedure for removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.25 Endotoxin Unit per mg of streptomycin.

Streptomycin Sulphate intended for use in the manufacture of parenteral preparations without a further appropriate sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from light and moisture. If it is intended for use in the manufacture of parenteral preparations the container should be sterile and sealed so as to exclude micro-organisms.

Labelling. The label states (1) the equivalent weight of streptomycin contained in it; (2) whether or not the contents are intended for use in the manufacture of parenteral preparations; (3) the name and quantity of any added stabiliser.

Streptomycin Injection

Streptomycin Sulphate Injection

Streptomycin Injection is a sterile material consisting of Streptomycin Sulphate with or without auxiliary agents. It is filled in a sealed container.

The injection is constituted by dissolving the contents of the sealed container in the requisite amount of sterile Water for Injections, immediately before use.

The constituted solution complies with the requirements for Clarity of solution and Particulate matter stated under Parenteral Preparations (Injections).

Storage. The constituted solution should be used immediately after preparation but, in any case, within the period recommended by the manufacturer.

Streptomycin Injection contains not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of streptomycin, $C_{21}H_{39}N_7O_{12}$.

The contents of the sealed container comply with the requirements stated under Parenteral Preparations (Powders for Injection) and with the following requirements.

Usual strengths. The equivalent of 750 mg and 1 g of streptomycin.

Description. A white or almost white powder which yields a clear, colourless or faintly yellow coloured solution when dissolved in water.

Identification

A. Determine by thin-layer chromatography (2.4.17). Prepare the plate by mixing 0.3 g of *carbomer* with 240 ml of *water*, allowing to stand with moderate stirring for 1 hour, adjusting the pH to 7.0 by the gradual addition with constant shaking of *2 M sodium hydroxide* and adding 30 g of *silica gel H*. Spread a uniform layer of the resulting suspension 0.75 mm thick. Heat the plate at 110° for 1 hour, allow to cool and use immediately.

Mobile phase. A 7 per cent w/v solution of *potassium dihydrogen phosphate*.

Test solution. Dissolve 0.1 g of the substance under examination in 100 ml of *water*.

Reference solution (a). A 0.1 per cent w/v of *streptomycin sulphate RS* in *water*.

Reference solution (b). A solution containing 0.1 per cent w/v of *streptomycin sulphate RS*, 0.1 per cent w/v of *neomycin sulphate RS* and 0.1 per cent w/v of *kanamycin monosulphate RS* in *water*.

Apply to the plate 10 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in warm air, spray with a mixture of equal volumes of a 0.2 per cent w/v solution of *naphthalene-1,3-diol* in *ethanol (95 per cent)* and *sulphuric acid (45 per cent)* and heat at 150° for 5 to 10 minutes. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.

B. Dissolve 5 to 10 mg in 4 ml of *water* and add 1 ml of *1 M sodium hydroxide*. Heat in a water-bath for 4 minutes. Add a slight excess of *2 M hydrochloric acid* and 0.1 ml of a 10 per cent w/v solution of *ferric chloride*; a violet colour is produced.

C. Dissolve 0.1 g in 2 ml of *water* and add 1 ml of *dilute 1-naphthol solution* and 2 ml of a mixture of equal volumes of *dilute sodium hypochlorite solution* and *water*; a red colour is produced.

D. Dissolve 10 mg in 5 ml of water and add 1 ml of *1 M hydrochloric acid*. Heat in a water-bath for 2 minutes. Add 2 ml of a 0.5 per cent w/v solution of *1-naphthol* in *1 M sodium hydroxide* and heat in a water-bath for 1 minute; a faint yellow colour is produced.

Tests

pH (2.4.24). 4.5 to 7.0, determined in a 25.0 per cent w/v solution.

Loss on drying (2.4.19). Not more than 7.0 per cent, determined on 1.0 g by drying in an oven at 60° over *phosphorus pentoxide* at a pressure not exceeding 0.1 kPa for 24 hours.

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. Determine on the mixed contents of ten containers by the microbiological assay of antibiotics, Method A or B (2.2.10).

Bacterial endotoxins (2.2.3): Not more than 0.25 Endotoxin Unit per mg of streptomycin.

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the equivalent amount of streptomycin.

Streptomycin Tablets

Streptomycin Sulphate Tablets

Streptomycin Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of streptomycin, $C_{21}H_{39}N_7O_{12}$.

Usual strength. The equivalent of 500 mg of streptomycin.

Identification

A. Triturate a quantity of the powdered tablets containing 0.2 g of streptomycin in a mixture of 2 ml of *methanol* and 0.1 ml of *sulphuric acid*, filter, if necessary, and allow to stand at about 25°; crystals of streptidine sulphate separate in the course of 2 to 3 days. Dissolve the crystals in a solution of 0.1 g of *picric acid* in 10 ml of hot *water* and cool; the precipitate, after recrystallisation from hot *water*, melts at about 283° (2.4.21).

B. Boil a small quantity of the powdered tablets containing 0.1 g of streptomycin with 5 ml of *1 M sodium hydroxide* for a few minutes, add a slight excess of *2 M hydrochloric acid* and 0.15 ml of a 10 per cent w/v solution of *ferric chloride*; a brilliant violet colour is produced.

Tests

Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 0.3 g of streptomycin and, triturate with 20 ml of *buffer solution pH 8.0*. Dilute to 100.0 ml with *water*.

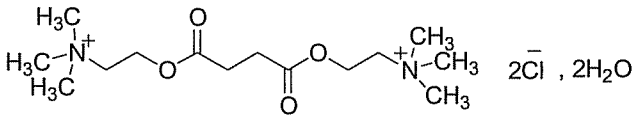
Determine by the microbiological assay of antibiotics, Method A or B (2.2.10).

Storage. Store protected from moisture.

Labelling. The label states the strength in terms of the equivalent amount of streptomycin.

Succinylcholine Chloride

Suxamethonium Chloride



$C_{14}H_{30}Cl_2N_2O_4,2H_2O$ Mol. Wt. 397.3

Succinylcholine Chloride is 2,2'-succinyldioxy-bis(ethyltrimethylammonium) dichloride dihydrate.

Succinylcholine Chloride contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{14}H_{30}Cl_2N_2O_4$, calculated on the anhydrous basis.

Category. Depolarising skeletal muscle relaxant.

Dose. By intravenous injection, 20 to 100 mg, according to the needs of the patient.

Description. A white or almost white, crystalline powder; almost odourless; hygroscopic.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *succinylcholine chloride RS* or with the reference spectrum of succinylcholine chloride.

B. Dissolve about 25 mg in 1 ml of *water*, add 0.1 ml of a 1 per cent w/v solution of *cobalt chloride* and 0.1 ml of *potassium ferrocyanide solution*; a green colour is produced.

C. Dissolve 1 g in sufficient *carbon dioxide-free water* to produce 20 ml. To 1 ml of this solution add 9 ml of *water*, 10 ml of *1 M sulphuric acid* and 30 ml of *ammonium reineckate solution*; a pink precipitate is produced. Allow to stand for 30 minutes, filter and wash with *water*, then with *ethanol (95 per cent)* and finally with *ether*. The residue, after drying at 80° melts at 180° to 185° (2.4.21).

D. Gives the reactions of chlorides (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *carbon dioxide-free water* (solution A) is clear (2.4.1). 4 ml of solution A diluted to 10 ml with *water* is colourless (2.4.1).

pH (2,4,24). 4.0 to 5.0, determined in a 0.5 per cent w/v solution.

Choline chloride. Determine by thin-layer chromatography (2.4.17), coating the plate with *microcrystalline cellulose*.

Mobile phase. A mixture of 50 volumes of *1-butanol*, 40 volumes of *water* and 10 volumes of *anhydrous formic acid*; shake for 10 minutes, allow to separate. Use the upper layer as the mobile phase.

Test solution. Dissolve 0.4 g of the substance under examination in 10 ml of *methanol*.

Reference solution. A solution containing 4 per cent w/v of *succinylcholine chloride RS* and 0.02 per cent w/v of *choline chloride* in *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air, spray with *potassium iodobismuthate solution*. Any secondary spot in the chromatogram obtained with the test solution is not more intense than the spot due to choline chloride in the chromatogram obtained with the reference solution. The test is not valid unless the chromatogram obtained with the reference solution shows two clearly separated spots.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Water (2.3.43). 8.0 to 10.0 per cent, determined on 0.3 g.

Assay. Weigh accurately about 0.3 g, dissolve in 30 ml of *anhydrous glacial acetic acid*, add 30 ml of *acetic anhydride* and 10 ml of *mercuric acetate solution*. Titrate with *0.1 M perchloric acid*, using *crystal violet solution* as indicator, until a bluish green colour is produced. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.01807 g of $C_{14}H_{30}Cl_2N_2O_4$.

Storage. Store protected from light and moisture.

Succinylcholine Injection

Suxamethonium Chloride Injection

Succinylcholine Injection is a sterile solution of Succinylcholine Chloride in Water for Injections.

Succinylcholine Injection contains not less than 90.0 per cent and not more than 107.5 per cent of the stated amount of succinylcholine chloride, $C_{14}H_{30}Cl_2N_2O_4,2H_2O$.

Usual strength. 50 mg per ml.

Identification

Dilute a volume containing 20 mg of Succinylcholine Chloride to 50 ml with *water*. To 0.5 ml add 2 ml of *chloroform*, 2 ml of a solution containing 0.16 per cent w/v of *citric acid* and 6.6 per cent w/v of *disodium hydrogen phosphate* and 0.1 ml of a solution containing 0.15 per cent w/v of each of *bromothymol blue* and *anhydrous sodium carbonate*. Shake for 2 minutes and allow to separate. The chloroform layer is yellow.

Tests

pH (2.4.28). 3.0 to 5.0.

Hydrolysis products. The volume of *0.1 M sodium hydroxide* required for the preliminary neutralisation in the Assay is not more than one tenth of the total volume of *0.1 M sodium hydroxide* required for the preliminary neutralisation and the hydrolysis.

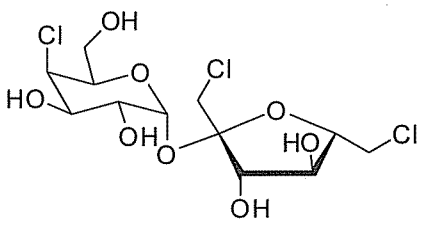
Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. To an accurately measured volume containing about 0.25 g of Succinylcholine Chloride add 30 ml of *carbon dioxide-free water* and shake with five quantities, each of 25 ml, of *ether*. Wash the combined ether solutions with two quantities, each of 10 ml, of *water* and discard the ether. Shake the combined washings with two quantities, each of 10 ml, of *ether*, add the washings to the original aqueous solution and neutralise with *0.1 M sodium hydroxide* using *bromothymol blue solution* as indicator. Add 25.0 ml of *0.1 M sodium hydroxide*, heat under a reflux condenser for 40 minutes, allow to cool and titrate the excess of alkali with *0.1 M hydrochloric acid* using *bromothymol blue solution* as indicator. Repeat the operation using 40 ml of *carbon dioxide-free water* beginning at the words "Add 25.0 ml of *0.1 M sodium hydroxide*.....". The difference between the titrations represents the amount of sodium hydroxide required.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01987 g of $C_{14}H_{30}Cl_2N_2O_4,2H_2O$.

Storage. Store protected from light, at a temperature between 2° to 8°. The injection should not be allowed to freeze.

Sucralose



$C_{12}H_{19}Cl_3O_8$ Mol. Wt. 397.6

Sucralose is 1,6-dichloro-1,6-dideoxy-β-D-fructofuranosyl-4-chloro-4-deoxy-α-D-galactopyranoside.

Sucralose contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{12}H_{19}Cl_3O_8$, calculated on the anhydrous basis.

Category. Pharmaceutical aid (sweetening vehicle).

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sucralose RS* or with the reference spectrum of sucralose.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Specific optical rotation (2.4.22). +84.0° to +87.5°, determined at 20° in a 1.0 per cent w/v solution in *water*.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel*.

Mobile phase. A mixture of 70 volumes of 5 per cent w/v solution of *sodium chloride* and 30 volumes of *acetonitrile*.

Test solution. Dissolve about 1.0 g of the substance under examination in 10 ml of *methanol*.

Reference solution (a). A 1.0 per cent w/v solution of *sucralose RS* in *methanol*.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 100.0 ml with *methanol*.

Apply to the plate 5 µl of each solution. After development, dry the plate in air and spray the plate with 15 per cent w/v solution of *sulphuric acid* in *methanol*. Heat the plate at 125° for 10 minutes. The Rf value of the principal spot obtained with the test solution corresponds to the spot in the chromatogram obtained with reference solution (a). Any secondary spot in the chromatogram obtained with the test

solution is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Hydrolysis products. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel.*

NOTE—This test does not require a developing solvent.

Test solution. Dissolve about 2.5 g of the substance under examination in 10 ml of *methanol.*

Reference solution (a). A 10.0 per cent w/v solution of *mannitol* in *water.*

Reference solution (b). A solution containing 0.04 per cent w/v of *fructose* and 10 per cent w/v of *mannitol* in *water.*

Apply to the plate 5 µl of each solution. Spray with a solution containing 1.23 g of *p-anisidine* and 1.66 g of *phthalic acid* in 100 ml of *methanol*, heat the plate at 105° for 15 minutes. If the spot from reference solution (a) has darkened, repeat the test, heating for a shorter period of time. Immediately after heating, view the plate against a dark background: the color of the spot obtained from the test solution is not more intense than that obtained from reference solution (b) (0.1 per cent).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.7 per cent.

Water (2.3.43). Not more than 2.0 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 25 mg of the substance under examination in 25 ml of the mobile phase.

Reference solution. A 0.1 per cent w/v solution of *sucralose RS* in the mobile phase.

Chromatographic system
- a stainless steel column 10 cm x 8.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 17 volumes of *water* and 3 volumes of *acetonitrile*,
- flow rate. 1.5 ml per minute,
- refractive index detector
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

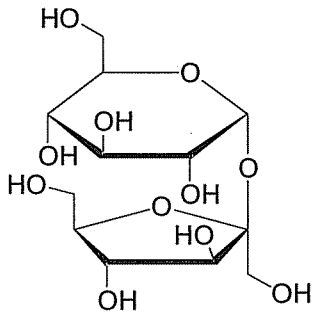
Inject the test solution and the reference solution.

Calculate the content of $C_{12}H_{19}Cl_3O_8$.

Storage. Store protected from moisture, at a temperature not exceeding 21°.

Sucrose

Refined Sugar



$C_{12}H_{22}O_{11}$ Mol. Wt. 342.3

Sucrose is β-D-fructofuranosyl α-D-glucopyranoside.

Category. Pharmaceutical aid (sweetening agent; tablet excipient).

Description. An almost white or colourless crystals, dry crystalline powder; odourless; taste, sweet.

Identification

Dissolve 150.0 g in sufficient *carbon dioxide-free water* prepared from *distilled water* to produce 300 ml (solution A). Dilute 1 ml of solution A to 100 ml with *water.* To 5 ml of the solution add 2 ml of freshly prepared *2 M sodium hydroxide* and 0.15 ml of a freshly prepared *copper sulphate solution*; the solution is clear and blue and remains so on boiling. To the hot solution add 4 ml of *2 M hydrochloric acid*, heat to boiling and add 4 ml of *2 M sodium hydroxide*; an orange precipitate is produced immediately.

Tests

Acidity or alkalinity. To 10 ml of solution A add 0.3 ml of *phenolphthalein solution.* The solution is colourless and not more than 0.6 ml of *0.01 M sodium hydroxide* is required to change the colour of the solution to pink.

Specific optical rotation (2.4.22). +65.9° to +67.0°, determined in a 10 per cent w/v solution.

Barium. To 10 ml of solution A add 1 ml of *1 M sulphuric acid.* When examined immediately and after 1 hour any opalescence is not more intense than that of a mixture of 1 ml of *distilled water* and 10 ml of solution A.

Calcium. To 1 ml of solution A add 9 ml of *water* and 1 ml of *ammonium oxalate solution*; the solution remains clear for at least 1 minute.

Heavy metals (2.3.13). Add 0.1 ml of *dilute hydrochloric acid* to 4 ml of solution A and dilute with sufficient *water* to produce

25 ml. The solution complies with the limit test for heavy metals, Method A (10 ppm).

Sulphites. To 4 ml of solution A add sufficient *water* to produce 20 ml, add 0.05 ml of *0.1 M iodine* and 0.05 ml of *starch solution*; a blue colour develops.

Dextrins. To 2 ml of solution A add 8 ml of *water*, 0.05 ml of *2 M hydrochloric acid* and 0.05 ml of *0.05 M iodine*; the solution remains yellow or becomes faint bluish green.

Glucose and invert sugar. Dissolve 20 g in sufficient *water* to make 100 ml and filter if necessary. Place 50 ml of the clear solution in a 250-ml beaker, add 50 ml of *alkaline cupric tartarate solution*, cover the beaker with a watch glass, heat the mixture at such a rate that it comes to a boil in approximately 4 minutes and continue boiling for exactly 2 minutes. Add immediately 100 ml of recently boiled and cooled *water* and collect the precipitated cuprous oxide on a tared sintered-glass crucible. Wash the residue with the hot *water*, then with 10 ml of *ethanol (95 per cent)* and finally with 10 ml of *ether*. Dry at 105° for 1 hour; the weight of the cuprous oxide is not more than 112 mg.

Colouring matter. A. To 100 ml of solution A in a ground-glass-stoppered tube add 1 ml of *dilute hypophosphorous acid* and allow to stand for 1 hour; no unpleasant odour is detectable.

B. Examine solution A in ultraviolet light at 365 nm. Any fluorescence is not more intense than that of a solution containing 0.4 µg per ml of *quinine sulphate* in *0.005 M sulphuric acid.*

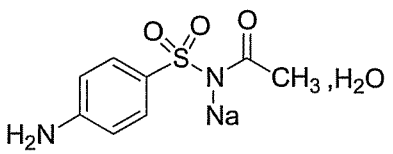
Sulphated ash (2.3.18). Not more than 0.1 per cent determined by dissolving 5.0 g in 5 ml of *water*, adding 2 ml of *sulphuric acid*, evaporating to dryness and igniting to constant weight.

Sucrose intended for use in the manufacture of parenteral preparations without a further appropriate procedure for the removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.25 Endotoxin unit per mg of Sucrose.

Storage. Store protected from light and moisture.

Sulphacetamide Sodium



$C_8H_9N_2NaO_3S,H_2O$ Mol. Wt. 254.2

Sulphacetamide Sodium is the monohydrate of the sodium salt of N^1-acetylsulphanilamide.

Sulphacetamide Sodium contains not less than 99.0 per cent and not more than 101.0 per cent of $C_8H_9N_2NaO_3S$, calculated on the anhydrous basis.

Category. Antibacterial.

Description. A white or yellowish white, crystalline powder; odourless.

Identification

Test A may be omitted if tests B, C, D, E and F are carried out. Tests B, C, D and E may be omitted if tests A and F are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sulphacetamide sodium RS* or with the reference spectrum of sulphacetamide sodium.

B. In the test for Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

C. Dissolve 1 g in 10 ml of *water*, add 6 ml of *2 M acetic acid* and filter. Wash the precipitate with a small volume of *water* and dry at 105° for 4 hours. The melting range of the precipitate is 181° to 185° (2.4.21).

D. Dissolve 0.1 g of the precipitate obtained in test C in 5 ml of *ethanol (95 per cent)*, add 0.2 ml of *sulphuric acid* and heat; ethyl acetate, recognizable by its odour, is produced.

E. Dissolve 1 mg of the precipitate obtained in test C in 5 ml of *water* with the aid of heat. The solution gives the reaction of primary aromatic amines (2.3.1), producing an orange-red precipitate.

F. A 5 per cent w/v solution gives the reactions of sodium salts (2.3.1).

Tests

Appearance of solution. A 5.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1), and not more intensely coloured than reference solution GYS4 (2.4.1).

pH (2.4.28). 8.0 to 9.5, determined in a 5.0 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

Note—Prepare the solutions immediately before use and protected from light.

Test solution. Dissolve 0.2 g of the substance under examination in 10.0 ml of the mobile phase.

Reference solution (a). Dissolve 5 mg each of *sulphacetamide sodium RS* and *sulphanilamide* (sulphacetamide sodium impurity A) in 1.0 ml of the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Further dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 12.5 cm x 4 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm)
- mobile phase: a mixture of 1 volumes of *glacial acetic acid*, 10 volumes of *methanol* and 89 volumes of *water*,
- flow rate. 0.8 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 10 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to sulphacetamide impurity A and sulphacetamide is not less than 5.0. The relative retention time with reference to sulphacetamide for sulphacetamide impurity A is about 0.5.

Inject the test solution and reference solution (b). Run the chromatogram 7 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of the peak due to sulphacetamide impurity A is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The sum of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphates (2.3.17). Dissolve 1.5 g in sufficient *distilled water* to produce 25 ml, add 25 ml of *2 M acetic acid*, shake for 30 minutes and filter. 25 ml of the filtrate complies with the limit test for sulphates (200 ppm).

Water (2.3.43). 6.0 to 8.0 per cent, determined on 0.2 g.

Assay. Weigh accurately about 0.25 g, dissolve in a mixture of 50 ml of *water* and 20 ml of *2 M hydrochloric acid*, add 3 g of *potassium bromide*, cool in ice and carry out the nitrite titration (2.3.31).

1 ml of *0.1 M sodium nitrite* is equivalent to 0.02362 g of $C_8H_9N_2NaO_3S$.

Storage. Store protected from light and moisture.

Sulphacetamide Eye Drops

Sulphacetamide Sodium Eye Drops

Sulphacetamide Eye Drops are a sterile solution of Sulphacetamide Sodium in Purified Water. It may contain a suitable antimicrobial agent.

Sulphacetamide Eye Drops contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of sulphacetamide sodium, $C_8H_9N_2NaO_3S,H_2O$.

Usual strengths. 10 per cent w/v; 20 per cent w/v; 30 per cent w/v.

Identification

To a volume containing 0.5 g of Sulphacetamide Sodium add 6 ml of *5 M acetic acid*, stirring constantly. Filter the precipitate, wash with *water* and dry at 105° for 4 hours. The residue complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sulphacetamide RS* or with the reference spectrum of sulphacetamide.

B. In the test for Related substances, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with the reference solution.

C. Dissolve 10 mg in 2 ml of *2 M hydrochloric acid*. The solution gives the reaction of primary aromatic amines (2.3.1).

Tests

Appearance of solution. Dilute the eye drops, if necessary, to contain 10.0 per cent w/v of Sulphacetamide Sodium. The solution is not more intensely coloured than reference solution BYS4 (2.4.1).

pH (2.4.24). 6.6 to 8.6.

Related substances. Determine by liquid chromatography (2.4.14).

Note—Prepare the solutions immediately before use and protected from light.

Test solution. Dissolve a volume of solution containing about 0.2 g of Sulphacetamide Sodium in 10.0 ml of the mobile phase.

Reference solution (a). Dissolve 5 mg each of *sulphacetamide sodium RS* and *sulphanilamide* (sulphacetamide sodium impurity A) in 1.0 ml of the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Further dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 12.5 cm x 4 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm)

- mobile phase: a mixture of 1 volumes of *glacial acetic acid*, 10 volumes of *methanol* and 89 volumes of *water*,
- flow rate. 0.8 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 10 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to sulphacetamide impurity A and sulphacetamide is not less than 5.0. The relative retention time with reference to sulphacetamide for sulphacetamide impurity A is about 0.5.

Inject the test solution and reference solution (b). Run the chromatogram 7 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of the peak due to sulphacetamide impurity A is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent), the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent). The sum of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Other tests. Comply with the tests stated under Eye Drops.

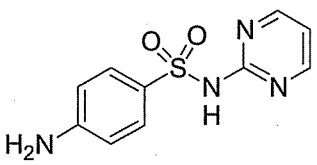
Assay. To an accurately measured volume containing about 0.5 g of Sulphacetamide Sodium add 75 ml of *water* and 10 ml of *hydrochloric acid*. Add 3 g of *potassium bromide*, cool in ice and carry out the nitrite titration (2.3.31).

1 ml of *0.1 M sodium nitrite* is equivalent to 0.02542 g of $C_8H_9N_2NaO_3S,H_2O$.

Storage. Store protected from light and moisture. The Eye Drops should not be allowed to freeze.

Labelling. The label states (1) the name and concentration of any antimicrobial agent used; (2) that it is not meant for injection; (3) that the solution should be used within one month of opening the container; (4) that the solution should not be used if it is dark brown in colour; (5) that it should not be allowed to freeze.

Sulphadiazine



$C_{10}H_{10}N_4O_2S$ Mol. Wt. 250.3

Sulphadiazine is *N*^{1}-(pyrimidin-2-yl)sulphanilamide.

Sulphadiazine contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{10}H_{10}N_4O_2S$, calculated on the dried basis.

Category. Antibacterial.

Dose. Initial dose, 3 g; subsequent doses, upto 4 g daily, in divided doses.

Description. White, yellowish white or pinkish white crystals or crystalline powder; almost odourless.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests C and D may be omitted if tests A and B are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sulphadiazine RS* or with the reference spectrum of sulphadiazine.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with the reference solution.

C. Dissolve about 5 mg in 10 ml of *1 M hydrochloric acid* and dilute 1 ml of this solution to 10 ml with *water*. The solution, without further acidification, gives the reaction of primary aromatic amines (2.3.1).

D. Heat 3 g in a test-tube inclined at an angle of 45° with the lower part immersed in a silicone oil-bath at about 270°. It decomposes and a white or yellowish white sublimate is produced. The sublimate, after recrystallisation from *toluene* and drying at 100° melts at 123° to 127° (2.4.21).

Tests

Appearance of solution. Dissolve 0.8 g in 10 ml of *1 M sodium hydroxide*. The solution is not more intensely coloured than reference solution YS5, BYS5 or GYS5 (2.4.1).

Acidity. Heat 1.25 g of the finely powdered substance at about 70° with 25 ml of *carbon dioxide-free water* for 5 minutes. Cool for about 15 minutes in ice and filter. To 20 ml of the filtrate add 0.1 ml of *bromothymol blue solution*. Not more than 0.2 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution.

Related substances (2.3.7). Complies with test C.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.2 g, dissolve in a mixture of 20 ml of *2 M hydrochloric acid* and 50 ml of *water*. Add 3 g of

potassium bromide, cool in ice and carry out the nitrite titration (2.3.31).

1 ml of *0.1 M sodium nitrite* is equivalent to 0.02503 g of $C_{10}H_{10}N_4O_2S$.

Storage. Store protected from light and moisture.

Sulphadiazine Tablets

Sulphadiazine Tablets contain not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of sulphadiazine, $C_{10}H_{10}N_4O_2S$.

Usual strength. 500 mg.

Identification

A. Triturate a quantity of the powdered tablets containing 0.5 g Sulphadiazine with two successive quantities, each of 5 ml, of *chloroform* and reject the chloroform. Triturate the residue with 10 ml of *dilute ammonia solution* for 5 minutes, add 10 ml of *water* and filter. Warm the filtrate until most of the ammonia has been expelled, cool and acidify with *acetic acid*. Collect the precipitate, wash with *water* and dry at about 100°; the residue melts at about 256°, with decomposition (2.4.21).

B. On the residue obtained in test A determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sulphadiazine RS* or with the reference spectrum of sulphadiazine.

C. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with the reference solution.

Tests

Related substances (2.3.7). Complies with test C, but using the following solutions.

Test solution (a). Extract a quantity of the powdered tablets containing 0.5 g of Sulphadiazine with 25 ml of a mixture of 90 volumes of *methanol* and 10 volumes of *strong ammonia solution* by shaking for 10 minutes, filter and use the filtrate.

Test solution (b). Dilute 1 volume of test solution (a) to 5 volumes with a mixture of 24 volumes of *methanol* and 1 volume of *strong ammonia solution*.

Test solution (c). Dilute 1 volume of test solution (a) to 200 volumes with the same solvent mixture.

Reference solution. A 0.4 per cent w/v solution of *sulphadiazine RS* in the same solvent mixture.

Dissolution (2.5.2).

Apparatus. No. 1,

Medium. 900 ml of *0.1 M hydrochloric acid*,

Speed and time. 100 rpm and 60 minutes.

Withdraw a suitable volume of the sample and filter promptly through a membrane filter disc with an average pore diameter not greater than 1.0 mm. Reject the first few ml of the filtrate and dilute a suitable volume of the filtrate with the same solvent. Dilute suitably with *0.01 M sodium hydroxide*. Measure the absorbances of the resulting solution and of a standard solution of *sulphadiazine RS* of similar concentration in the same medium at the maximum at about 254 nm (2.4.7).

Calculate the content of $C_{10}H_{10}N_4O_2S$ in the medium.

D. Not less than 70.0 per cent of the stated amount of $C_{10}H_{10}N_4O_2S$.

Other tests. Comply with the tests stated under Tablets.

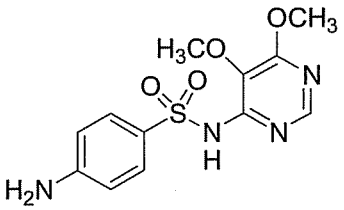
Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 0.5 g of Sulphadiazine and dissolve as completely as possible in a mixture of 50 ml of *water* and 10 ml of *hydrochloric acid*. Carry out the nitrite titration (2.3.31).

1 ml of *0.1 M sodium nitrite* is equivalent to 0.02503 g of $C_{10}H_{10}N_4O_2S$.

Storage. Store protected from light and moisture.

Sulphadoxine

Sulphormethoxine; Sulphoethomidine



$C_{12}H_{14}N_4O_4S$ Mol. Wt. 310.3

Sulphadoxine is *N*^{1}-(5,6-dimethoxypyrimidin-4-yl)sulphanilamide.

Sulphadoxine contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{12}H_{14}N_4O_4S$, calculated on the dried basis.

Category. Antibacterial; antimalarial in combination with pyrimethamine.

Dose. Orally, initially, 2 g; subsequent doses, 1 to 1.5 g weekly. By deep intramuscular or slow intravenous injection, 2.5 g initially, followed by 1.5 g after four days.

Description. White or yellowish white crystals or crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and D may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sulphadoxine RS* or with the reference spectrum of sulphadoxine.

B. In the test for Related substances, the principal spot in the chromatogram obtained with reference solution (a) corresponds to that in the chromatogram obtained with the reference solution (c).

C. Dissolve 0.5 g in 1 ml of *sulphuric acid (40 per cent)*, heating gently to effect solution, and continue heating until a crystalline precipitate is produced. Allow to cool, add 10 ml of *2 M sodium hydroxide*, cool again, add 25 ml of *ether* and shake for 5 minutes. Dry the upper layer over *anhydrous sodium sulphate*, filter and evaporate the solvent by heating on a water-bath. The residue melts either at 80° to 82° or at 90° to 92° (2.4.21).

D. Dissolve about 5 mg in 10 ml of *1 M hydrochloric acid* and dilute 1 ml to 10 ml with *water*. The resulting solution, without further acidification, gives the reaction of primary aromatic amines (2.3.1).

Tests

Appearance of solution. Dissolve 0.8 g in 10 ml of *1 M sodium hydroxide*. The solution is not more intensely coloured than reference solution YS5, BYS5 or GYS5 (2.4.1).

Acidity. Heat 1.25 g of the finely powdered substance at about 70° with 25 ml of *carbon dioxide-free water* for 5 minutes. Cool for about 15 minutes in ice and filter. To 20 ml of the filtrate add 0.1 ml of *bromothymol blue solution*. Not more than 0.2 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution.

Related substances. Complies with the test for related substances in sulphonamides (2.3.7), Method C, but using the following solution.

Test solution. A 2 per cent w/v solution of the substance under examination in a mixture of 24 volumes of *methanol* and 1 volume of *strong ammonia solution*.

Heavy metals (2.3.13).1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

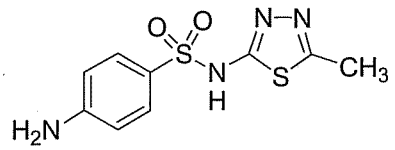
Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.25 g, dissolve in 50 ml of *2 M hydrochloric acid*, add 3 g of *potassium bromide*, cool in ice and carry out the nitrite titration (2.3.31).

1 ml of *0.1 M sodium nitrite* is equivalent to 0.03103 g of $C_{12}H_{14}N_4O_4S$.

Storage. Store protected from light and moisture.

Sulphamethizole



$C_9H_{10}N_4O_2S_2$ Mol. Wt. 270.3

Sulphamethizole is N^1-(5-methyl-1,3,4-thiadiazol-2-yl)sulphanilamide.

Sulphamethizole contains not less than 99.0 per cent and not more than 101.0 per cent of $C_9H_{10}N_4O_2S_2$, calculated on the dried basis.

Category. Antibacterial.

Dose. 100 to 200 mg every four to six hours.

Description. White or yellowish white crystals or crystalline powder; odourless.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests C and D may be omitted if tests A and B are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sulphamethizole RS* or with the reference spectrum of sulphamethizole.

B. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (b).

C. Dissolve 50 mg in 4 ml of *methanol* and add 0.2 ml of a 4.0 per cent w/v solution of *cupric acetate*; a flocculent, yellowish green precipitate is produced which becomes dark green.

D. Dissolve about 5 mg in 10 ml of *1 M hydrochloric acid* and dilute 1 ml of this solution to 10 ml with *water*. The solution, without further acidification, gives the reaction of primary aromatic amines (2.3.1).

Tests

Appearance of solution. Dissolve 0.8 g in 10 ml of *1 M sodium hydroxide*. The solution is not more intensely coloured than reference solution YS5, BYS5 or GYS5 (2.4.1).

Acidity. Heat 1.25 g of the finely powdered substance at about 70° with 25 ml of *carbon dioxide-free water* for 5 minutes. Cool for about 15 minutes in ice and filter. To 20 ml of the filtrate add 0.1 ml of *bromothymol blue solution*. Not more than 0.2 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution.

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 80 volumes of *chloroform* and 15 volumes of *methanol*.

Test solution (a). Dissolve 0.3 g of the substance under examination in 10 ml of *acetone*.

Test solution (b). Dissolve 0.3 g of the substance under examination in 100 ml of *acetone*.

Reference solution (a). Dissolve 15 mg of the substance under examination in 100 ml of *acetone*.

Reference solution (b). A 0.3 per cent w/v solution of *sulphamethizole RS* in *acetone*.

Apply to the plate 2 µl of each solution. After development, dry the plate at 105° and examine in ultraviolet light at 254 nm. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

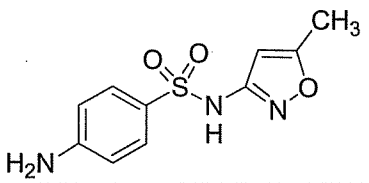
Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.25 g, dissolve in 50 ml of *2 M hydrochloric acid*, add 3 g of *potassium bromide*, cool in ice and carry out the nitrite titration (2.3.31).

1 ml of *0.1 M sodium nitrite* is equivalent to 0.02703 g of $C_9H_{10}N_4O_2S_2$.

Storage. Store protected from light and moisture.

Sulphamethoxazole



$C_{10}H_{11}N_3O_3S$ Mol. Wt. 253.3

Sulphamethoxazole is *N*[1]-(5-methylisoxazol-3-yl)sulphanilamide.

Sulphamethoxazole contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{10}H_{11}N_3O_3S$, calculated on the dried basis.

Category. Antibacterial.

Dose. Initial dose, 2 g; subsequent doses, 1 g two or three times daily.

Description. A white or almost white, crystalline powder; almost odourless.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sulphamethoxazole RS* or with the reference spectrum of sulphamethoxazole.

B. In the test for Related substances, the principal spot in the chromatogram obtained with reference solution (a) corresponds to that in the chromatogram obtained with the reference solution (c).

C. Dissolve about 5 mg in 10 ml of *1 M hydrochloric acid* and dilute 1 ml to 10 ml with *water*. The resulting solution, without further acidification, gives the reaction of primary aromatic amines (2.3.1).

D. Melting range (2.4.21). 169° to 172°.

Tests

Appearance of solution. Dissolve 0.8 g in 10 ml of *1 M sodium hydroxide*. The solution is not more intensely coloured than reference solution YS5, BYS5 or GYS5 (2.4.1).

Acidity. Heat 1.25 g of the finely powdered substance with 25 ml of *carbon dioxide-free water* at 70° for 5 minutes. Cool for about 15 minutes in ice and filter. To 20 ml of the filtrate add 0.1 ml of *bromothymol blue solution*. Not more than 0.3 ml of *0.1 M sodium hydroxide* is required to change the colour of the solution.

Related substances. Complies with the test for Related Substances in Sulphonamides (2.3.7), Method C, but using the following solution.

Test solution. Dissolve 0.1 g of the substance under examination in sufficient of a mixture of 1 volume of *strong ammonia solution* and 24 volumes of *methanol* to produce 5 ml.

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

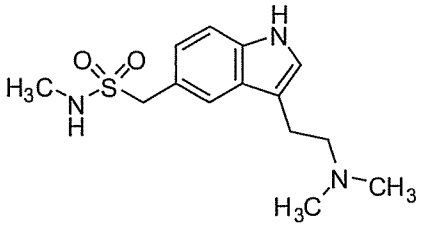
Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.2 g, dissolve in 50 ml of *2 M hydrochloric acid*, add 3 g of *potassium bromide*, cool in ice and carry out the nitrite titration (2.3.31).

1 ml of *0.1 M sodium nitrite* is equivalent to 0.02533 g of $C_{10}H_{11}N_3O_3S$.

Storage. Store protected from light and moisture.

Sumatriptan



$C_{14}H_{21}N_3O_2S$ Mol. Wt. 295.4

Sumatriptan is 3-(2-dimethylaminoethyl)indol-5-yl-*N*-methylmethanesulphonamide.

Sumatriptan contains not less than 97.5 per cent and not more than 102.0 per cent of $C_{14}H_{21}N_3O_2S$, calculated on the anhydrous basis.

Category. Antimigraine.

Description. A white to pale yellow powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sumatriptan RS*.

Tests

Impurities A and H. Determine by liquid chromatography (2.4.14).

Solvent mixture. 1 volume of *acetonitrile* and 3 volumes of *0.025 M sodium dihydrogen orthophosphate*, adjusted to pH 6.5.

Test solution (a). A 0.2 per cent w/v solution of the substance under examination in the solvent mixture.

Test solution (b). Dilute 1 ml of test solution (a) to 100 ml with the solvent mixture.

Reference solution. Dissolve the contents of a vial of *sumatriptan for system suitability RS* to 1 ml with *1 M hydrochloric acid*.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with silica gel (5 µm) (such as Spherisorb silica S5W),
- mobile phase: a mixture of 10 volumes of *10 M ammonium acetate* and 90 volumes of *methanol*,
- flow rate. 2 ml per minute,
- spectrophotometer set at 282 nm,
- injection volume. 20 µl.

Inject the reference solution. Run the chromatogram 5 times the retention time of the principal peak. The test is not valid unless the resolution between [3-[2-(dimethylamino)ethyl]-2-[[3-[2-(dimethylamino)ethyl]-1*H*-indol-5-yl]methyl]-1*H*-indol-5-yl]-*N*- methylmethanesulphonamide (sumatriptan impurity A) and sumatriptan is not less than 1.5.

Inject test solution (a) and (b). In the chromatogram obtained with test solution (a) the area of any peak corresponding to sumatriptan impurity A is not more than the area of the principal peak in the chromatogram obtained with test solution (b) (0.6 per cent, taking into account the correction factor of 0.6 for impurity A) and the area of any peak due to [3-[2-(dimethylamino)ethyl]-1-[[3-[2-(dimethylamino)ethyl]-1*H*-indol-5-yl]methyl]-1*H*-indol-5-yl]-*N*- methylmethanesulphonamide (sumatriptan impurity H) is not more than 0.3 times the area of the principal peak in the chromatogram obtained with test solution (b) (0.3 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 25 volumes of *acetonitrile* and 75 volumes of *0.025 M sodium dihydrogen orthophosphate*, adjusted to pH 6.5.

Test solution (a). A 0.2 per cent w/v solution of the substance under examination in the solvent mixture.

Test solution (b). Dilute 1 ml of test solution (a) to 100 ml with the solvent mixture and further dilute 1 ml of the resulting solution to 10 ml with the solvent mixture.

Reference solution. Dilute the contents of a vial of *sumatriptan impurity mixture RS* to 1 ml with *0.1 M hydrochloric acid*.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (such as Spherisorb ODS 1),
- mobile phase: a mixture of 75 volumes of a solution containing 0.97 g of *dibutylamine*, 0.735 g of *sodium orthophosphoric acid* and 2.93 g of *sodium dihydrogen orthophosphate* in 750 ml *water*, adjusted to pH 6.5 with *10 M sodium hydroxide* and diluted to 1000 ml with *water*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 282 nm,

– injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the resolution between the peaks due to [3-[2-(dimethylamino) ethyl]-1-(hydroxymethyl)-1*H*-indol-5-yl]-*N*- methylmethanesulphonamide (sumatriptan impurity C) and sumatriptan is not less than 1.5.

Inject test solution (a) and (b). In the chromatogram obtained with test solution (a) the areas of any peaks corresponding to *N*-methyl[3-[2-(methylamino)ethyl]-1*H*-indol-5-yl]methanesulphonamide (sumatriptan impurity B), [3-[2-(dimethylamino)ethyl]-1-(hydroxymethyl)-1*H*-indol-5-yl]-*N*-methylmethanesulphonamide (sumatriptan impurity C) and *N*,*N*-dimethyl-2-[5-[(methylsulphamoyl)methyl]-1*H*-indol-3-yl]ethanamine *N*-oxide (sumatriptan impurity D) is not more than 5 times the area of the principal peak in the chromatogram obtained with test solution (b) (0.5 per cent); the area of any peak corresponding to [3-(2-aminoethyl)-1*H*-indol-5-yl]-*N*-methylmethanesulphonamide (sumatriptan impurity E) is not more than the principal peak in the chromatogram obtained with test solution (b) (0.1 per cent); the area of any other secondary peak is not more than the principal peak in the chromatogram obtained with test solution (b) (0.1 per cent). The total impurity content in the test for Impurities A and H and in the test for Related substances is not more than 1.5 per cent. Ignore any peak with an area less than 0.5 times the area of the peak in the chromatogram obtained with test solution (b) (0.05 per cent).

Water (2.3.43). Not more than 1.0 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14) as described under Related substances, using the following solutions.

Test solution. Dissolve 10 mg of the substance under examination in 100.0 ml of the solvent mixture.

Reference solution (a). A 0.014 per cent w/v solution of *sumatriptan succinate RS* in the solvent mixture.

Reference solution (b). Dilute the contents of a vial of *sumatriptan impurity mixture RS* to 1 ml with *0.1 M hydrochloric acid.*

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to sumatriptan and sumatriptan impurity C is not less than 1.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{14}H_{21}N_3O_2S$.

Storage. Store protected from light.

Sumatriptan Injection

Sumatriptan Injection is a sterile isotonic solution of Sumatriptan Succinate in Water for Injections.

Sumatriptan Injection contains not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of sumatriptan succinate, $C_{14}H_{21}N_3O_2S,C_4H_6O_4$.

Usual strength. 1 mg per ml.

Description. A clear, colourless to pale yellow solution.

Identification

To a volume of the injection containing 40 mg of sumatriptan succinate add 1 ml of *saturated sodium chloride solution* and 1 ml of *saturated sodium carbonate solution.* Shake vigorously for 30 seconds, add two quantities of 2 ml of *propan-2-ol,* shake, allow to separate (this may take up to 24 hours) and discard the aqueous layer. Evaporate under a stream of nitrogen and dry at 100°. On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *sumatriptan succinate RS.*

Tests

pH (2.4.24). 4.2 to 5.3.

For impurities A and H. Determine by liquid chromatography (2.4.14).

Solvent mixture. 75 volumes of *0.025 M sodium dihydrogen orthophosphate*, adjusted to *pH 6.5* and 25 volumes of *acetonitrile.*

Test solution. Dilute a volume of injection containing 30 mg of Sumatriptan Succinate to 10.0 ml with the solvent mixture.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with the solvent mixture.

Reference solution (b). Dilute the contents of a vial of *sumatriptan for system suitability RS* (containing impurities A ([3-[2-(dimethylamino)ethyl]-2-[[3-[2-(dimethylamino)ethyl]-1*H*-indol-5-yl]methyl]-1*H*-indol-5-yl]-*N*-methylmethane sulphonamide) and H ([3-[2-(dimethylamino)ethyl]-1-[[3-[2-(dimethylamino)ethyl]-1*H*-indol-5-yl]methyl]-1*H*-indol-5-yl]-*N*-methylmethanesulphonamide) to 1 ml with *1 M hydrochloric acid.*

Chromatographic system
– a stainless steel column 25 cm × 4.6 mm, packed with silica (such as Spherisorb silica S5W),
– mobile phase: a mixture of 10 volumes of *10 M ammonium acetate* and 90 volumes of methanol,
– flow rate. 2 ml per minute,
– spectrophotometer set at 282 nm,
– injection volume. 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to sumatriptan and sumatriptan impurity A is not less than 1.5.

Inject the test solution and reference solution (a). Run the chromatogram 5 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of any peak corresponding to sumatriptan impurity A is not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.5 per cent) and the area of secondary peak corresponding to sumatriptan impurity H is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 75 volumes of *0.025 M sodium dihydrogen orthophosphate*, the pH of which has been adjusted to 6.5 and 25 volumes *acetonitrile*.

Test solution (a). Dilute a volume of injection containing 30 mg of Sumatriptan Succinate in 10 ml of the solvent mixture.

Test solution (b). Dilute 1.0 ml of test solution (a) to 100.0 ml with the solvent mixture.

Reference solution (a). Dilute the contents of a vial of *sumatriptan impurity mixture RS* (contains sumatriptan impurity B (*N*-methyl[3-[2-(methylamino)ethyl]-1*H*-indol-5-yl]methanesulphonamide), C ([3-[2-(dimethylamino)ethyl]-1-(hydroxymethyl)-1*H*- indol-5-yl]-*N*-methylmethanesulphonamide), D (*N,N*-dimethyl-2-[5-[(methylsulphamoyl)methyl]-1*H*-indol-3-yl]ethanamine N- oxide), and E ([3-(2-aminoethyl)-1*H*-indol-5-yl]-*N*-methylmethanesulphonamide) to 1 ml with *0.1 M hydrochloric acid*.

Reference Solution (b). A 0.3 per cent w/v solution of *sumatriptan impurity standard RS* in the solvent mixture.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (such as Spherisorb ODS 1),
- mobile phase: a mixture of 25 volumes of *acetonitrile* and 75 volumes of a solution containing 0.97 g of *dibutylamine*, 0.735 g of *orthophosphoric acid* and 2.93 g of *sodium dihydrogen orthophosphate*, adjust the pH to 7.5 with *10 M sodium hydroxide* and diluted to 1000 ml with *water*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 282 nm,
- injection volume. 20 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to sumatriptan impurity C and sumatriptan is not less than 1.5.

Inject test solution (a), (b) and reference solution (b). In the chromatogram obtained with test solution (a) the area of any peak corresponding to (3a-hydroxy,1,1-dimethyl-5-[(methylamino)sulfonyl]methyl-1,2,3,3a,8,8a-hexahydropyrrolo[2,3-b]indol-1-ium trifuoroacetate) (sumatriptan impurity A) is not more than 1.5 times the area of the principal peak in the chromatogram obtained with test solution (b) (1.5 per cent), the area of any peak corresponding to 2 (1-3-[2-(dimethylamino)ethyl]-3-hydroxy-2-oxo-2,3-dihydro-1*H*-indol-5-yl-*N*-methylmethanesulfonamide) (sumatriptan impurity H) is not more than the area of the principal peak in the chromatogram obtained with test solution (b) (1.0 per cent). The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with test solution (b) (1.0 per cent) and sum of areas of the peaks due to sumatriptan impurity A and H is not more than 4 times the area of the principal peak in the chromatogram obtained with test solution (b) (4.0 per cent).

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Bacterial endotoxins (2.2.3). Not more than 350.0 Endotoxin Units per ml of sumatriptan succinate.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dilute the volume of injection containing 3 mg of Sumatriptan succinate in 100 ml of the solvent mixture.

Reference solution (a). A 0.003 per cent w/v solution of *sumatriptan succinate RS* in the solvent mixture.

Reference solution (b). Dilute the contents of a vial of *sumatriptan impurity mixture RS* (contains impurities B, C, D and E) to 1 ml with *0.1 M hydrochloric acid*.

Use chromatographic system as described under Related substances.

Inject reference solution (b). The test is not valid unless resolution between the peaks due to sumatriptan succinate and sumatriptan succinate impurity C is not less than 1.5.

Inject reference solution (a) and the test solution.

Calculate the content of $C_{14}H_{21}N_3O_2S,C_4H_6O_4$ in the injection.

Storage. Store protected from light.

T

Talc

Purified Talc; Talcum

Talc is a powdered, selected natural hydrated magnesium silicate. It may contain varying amounts of aluminium and iron in forms insoluble in *1 M sulphuric acid.*

Category. Pharmaceutical aid (dusting powder).

Description. A white or almost white powder, free from grittiness; readily adheres to the skin; unctuous to the touch; odourless.

Production

Talc derived from deposits that are known to contain associated asbestos is not suitable for pharmaceutical use. The manufacturer is responsible for demonstrating by the test for amphiboles and serpentines that the product is free from asbestos. The presence of amphiboles and of serpentines is revealed by infrared spectrophotometry. If detected, the specific morphological criteria of asbestos are investigated by a suitable method of optical microscopy to determine whether tremolite asbestos or chrysotile is present, as described below.

Determine by infrared absorption spectrophotometry (2.4.6).

In the range 740 cm^{-1} to 760 cm^{-1} using scale expansion, any absorption band at 758 cm^{-1} may indicate the presence of tremolite or of chlorite. If the absorption band remains after ignition of the substance under examination at 850 ± 50° for at least 30 minutes, it indicates the presence of the tremolite. In the range 600 cm^{-1} to 650 cm^{-1} using scale expansion, any absorption band or shoulder may indicate the presence of serpentines.

Identification

Test A may be omitted if tests B, C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6), shows absorption bands at 3677 cm^{-1}, 1018 cm^{-1} and 669 cm^{-1}.

B. In a platinum crucible, melt a mixture of 0.2 g of *anhydrous sodium carbonate* and 2.0 g of *potassium carbonate.* To the melted mass add 0.1 g of the substance under examination and heat until the mixture is completely melted. Allow to cool and transfer the melted mass into an evaporating dish with 50 ml of hot *water.* Add *hydrochloric acid* until effervescence ceases. Add 10 ml of *hydrochloric acid* and evaporate to dryness on a water-bath. Allow to cool. Add 20 ml of *water,* heat to boiling and filter (the residue is used for identification test C). To 5 ml of the filtrate add 1 ml of *ammonia* and 1 ml of *ammonium chloride solution* and filter. To the filtrate add 1 ml of *disodium hydrogen phosphate solution.* A white, crystalline precipitate is formed.

C. The residue obtained in identification test B gives the reaction of silicates (2.3.1).

Tests

Acidity or alkalinity. Shake 5.0 g with 25 ml of *carbon dioxide-free water* for 1 minute, filter and add to the filtrate 0.5 ml of *bromothymol blue solution*; the solution is not acidic and requires not more than 0.3 ml of *0.1 M hydrochloric acid* to make it acidic.

Iron (2.3.14). Boil 4.0 g with 25 ml of *water* for 30 minutes, replacing the water lost by evaporation, and filter. The filtrate, after the addition of 5 ml of *nitric acid,* complies with the limit test for iron (10 ppm).

Acid-soluble substances. Not more than 2.0 per cent, determined by the following method. Digest 2.0 g with 40 ml of *dilute hydrochloric acid* for 15 minutes, filter, evaporate the filtrate; to the residue add 0.1 ml of *sulphuric acid* and ignite to constant weight.

Water-soluble substances. Shake 5.0 g with 25 ml of *water* for 1 minute, filter, evaporate the filtrate and dry to constant weight; the residue weighs not more than 10 mg.

Carbonates. To 1 g add 20 ml of *dilute hydrochloric acid*; no effervescence is produced.

Chlorides (2.3.12). Suspend 2.0 g in 10 ml of *water,* add 10 ml of *2 M nitric acid,* shake for 15 minutes and filter. 10 ml of the filtrate complies with the limit test for chlorides (250 ppm).

Organic compounds. The residue obtained in the test for Loss on drying is not more than slightly yellow or grey.

Loss on drying (2.4.19). Not more than 1.0 per cent, determined on 1.0 g by drying in an oven at 180° for 1 hour.

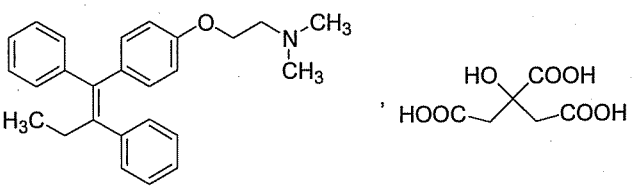
Microbial contamination (2.2.9).

If intended for topical administration, the total viable aerobic count is not more than a total of 10^2 bacteria and fungi per gram.

If intended for oral administration, the total viable aerobic count is not more than 10^3 bacteria and not more than 10^2 fungi per gram.

Storage. Store protected from moisture.

Tamoxifen Citrate



$C_{26}H_{29}NO,C_6H_8O_7$ Mol. Wt. 563.7

Tamoxifen Citrate is (*Z*)-2-[4-(1,2-diphenylbut-1-enyl)-1- phenoxy]ethyldimethylamine citrate.

Tamoxifen Citrate contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{26}H_{29}NO$, $C_6H_8O_7$, calculated on the dried basis.

Category. Antioestrogen.

Dose. The equivalent of 20 to 40 mg of tamoxifen daily as a single dose or in 2 divided doses.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests C and D may be omitted if tests A and B are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tamoxifen citrate RS* or with the reference spectrum of tamoxifen citrate.

B. When examined in the range 220 nm to 360 nm (2.4.7), a 0.002 per cent w/v solution in *methanol* shows absorption maxima at about 237 nm and 275 nm.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254.*

Mobile phase. A mixture of 90 volumes of *toluene* and 10 volumes of *triethylamine.*

Test solution. Dissolve 0.1 g of the substance under examination in 10 ml of *methanol.*

Reference solution. A 1.0 per cent w/v solution of *tamoxifen citrate RS* in *methanol.*

Apply to the plate 5 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

D. To 10 mg add 4 ml of *pyridine* and 2 ml of *acetic anhydride* and shake; a yellow colour is produced. Heat in a water-bath for 2 minutes; a pink to red colour is produced.

Tests

E-Isomer and related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.25 g of the substance under examination in 100 ml of a mixture of 60 volumes of *acetonitrile*, 25 volumes of *water* and 15 volumes of *tetrahydrofuran.*

Reference solution (a). A 0.0025 per cent w/v solution of the substance under examination in a mixture of 60 volumes of *acetonitrile*, 25 volumes of *water* and 15 volumes of *tetrahydrofuran.*

Reference solution (b). A 0.25 per cent w/v solution of *tamoxifen citrate impurity standard RS* in the same solvent mixture.

Chromatographic system
- a stainless steel column 20 cm × 5 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of *acetonitrile*, 25 volumes of *water*, 15 volumes of *tetrahydrofuran* and 0.4 volume of *strong ammonia solution,*
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume. 20 µl.

In the chromatogram obtained with reference solution (b) a peak due to *E*-isomer appears immediately following the peak due to *Z*-tamoxifen. Adjust the sensitivity of the instrument so that the height of the peak due to *E*-isomer is about 15 per cent of the full-scale deflection on the recorder. Measure the height of the peak due to *E*-isomer by dropping a perpendicular from the top of the peak to a line drawn tangentially between the troughs on each side of the *E*-isomer peak or the trough between the E- and *Z*-isomer peaks and the baseline, whichever is appropriate.

The test is not valid unless the height of the trough separating the peaks due to *E*- and *Z*-tamoxifen in the chromatogram obtained with reference solution (b) is less than 7 per cent of full-scale deflection on the recorder and the retention time of the principal peak is less than 30 minutes. (The retention time decreases with increasing concentration of ammonia in the mobile phase).

The content of *E*-isomer in the substance under examination is not more than 1.0 per cent calculated from the declared content of *E*-isomer in *tamoxifen citrate impurity standard RS.* The area of any secondary peak in the chromatogram obtained with the test solution, other than a peak due to *E*-isomer, is not greater than half that of the peak due to tamoxifen citrate in the chromatogram obtained with reference solution (a) and the sum of the areas of all such peaks is not greater than the area of the peak due to tamoxifen in the chromatogram obtained with reference solution (a). Ignore any peak with a retention time less than 2.5 minutes and any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method B (10 ppm).

Sulphated ash (2.3.18). Not more than 0.2 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 1.0 g, dissolve in 150 ml of *anhydrous glacial acetic acid.* Titrate with *0.1 M perchloric*

acid, using *1-naphtholbenzein solution* as indicator. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.05636 g of $C_{26}H_{29}NO, C_6H_8O_7$.

Storage. Store protected from light and moisture.

Tamoxifen Tablets

Tamoxifen Citrate Tablets

Tamoxifen Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of tamoxifen, $C_{26}H_{29}NO$.

Usual strengths. The equivalent of 10 mg, 20 mg and 40 mg of tamoxifen.

Identification

A. To a quantity of the powdered tablets containing 0.1 g of tamoxifen add 20 ml of *water*, warm, add 2 ml of *5 M sodium hydroxide* and cool. Extract with two quantities, each of 10 ml, of *ether*, filtering after each extraction. Combine the ether extracts and evaporate to dryness in a stream of nitrogen at room temperature. Dry the residue at a pressure not exceeding 0.7 kPa for 30 minutes.

On the residue, determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tamoxifen citrate RS* or with the reference spectrum of tamoxifen citrate.

B. When examined in the range 220 nm to 360 nm (2.4.7), a 0.002 per cent w/v solution in *methanol* of the residue obtained in test A shows absorption maxima at about 237 nm and 275 nm.

C. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 100 volumes of *ethyl acetate*, 10 volumes of *methanol* and 1 volume of *strong ammonia solution*.

Test solution. Shake a quantity of the powdered tablets containing 0.1 g tamoxifen with 10 ml of *methanol*, filter, evaporate the filtrate to dryness on a water-bath, dry the residue at 100° for 30 minutes and dissolve 10 mg of the residue in 10 ml of *methanol*.

Reference solution. A 0.1 per cent w/v solution of *tamoxifen citrate RS* in *methanol*.

Apply to the plate 10 µl of each solution. After development, dry the plate in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

D. Dissolve 10 mg of the residue obtained in the preparation of the test solution in test C in 4 ml of *pyridine*, add 2 ml of *acetic anhydride* and heat on a water-bath for 2 minutes; a pink to red colour is produced.

Tests

E-Isomer and Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Mix a quantity of the powdered tablets containing 60 mg of tamoxifen with 60 ml of a mixture of 60 volumes of *acetonitrile*, 25 volumes of *water* and 15 volumes of *tetrahydrofuran* with the aid of ultrasound for 5 minutes, dilute to 100 ml with the same solvent mixture and filter through Whatman No. 1 filter paper.

Reference solution (a). Dilute 1.0 ml of the test solution to 100 ml with the same solvent mixture.

Reference solution (b). A 0.1 per cent w/v solution of *tamoxifen citrate impurity standard RS* in the same solvent mixture.

Chromatographic system

- a stainless steel column 20 cm x 5 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 60 volumes of *acetonitrile*, 25 volumes of *water*, 15 volumes of *tetrahydrofuran* and 0.4 volume of *strong ammonia solution*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 240 nm,
- injection volume. 20 µl.

In the chromatogram obtained with reference solution (b) a peak due to *E*-isomer appears immediately following the peak due to *Z*-tamoxifen. Adjust the sensitivity of the instrument so that the height of the peak due to *E*-isomer is about 15 per cent of full-scale deflection on the recorder. Measure the height of the peak due to *E*-isomer by dropping a perpendicular from the top of the peak to a line drawn tangentially between the troughs on each side of the *E*-isomer peak or the trough between the *E*- and *Z*-isomer peaks and the baseline, whichever is appropriate.

The test is not valid unless the height of the trough separating the peaks due to *E*- and *Z*-tamoxifen in the chromatogram obtained with reference solution (b) is less than 7 per cent of the full-scale deflection on the recorder and the retention time of the principal peak is less than 30 minutes. (The retention time decreases with increasing concentration of ammonia in the mobile phase).

The content of *E*-isomer in the substance under examination is not more than 1 per cent calculated from the declared content

of *E*-isomer in *tamoxifen citrate impurity standard RS*. The area of any secondary peak in the chromatogram obtained with the test solution, other than a peak due to *E*-isomer, is not greater than half that of the peak due to tamoxifen citrate in the chromatogram obtained with reference solution (a) and the sum of the areas of all such peaks is not greater than the area of the peak due to tamoxifen in the chromatogram obtained with reference solution (a). Ignore any peak with a retention time less than 2.5 minutes and any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a).

Uniformity of content. *(For tablets containing 10 mg or less)* — Comply with the test stated under Tablets.

Crush one tablet and transfer to a 100-ml volumetric flask with the aid of 75 ml of *methanol*. Shake well for 5 minutes, add sufficient *methanol* to produce 100.0 ml and filter. Dilute 10.0 ml of the filtrate to 100.0 ml with *methanol*. Measure the absorbance of the resulting solution at the maximum at about 275 nm (2.4.7). Calculate the content of $C_{26}H_{29}NO$ in the tablet taking 325 as the specific absorbance at 275 nm.

Other tests. Comply with the tests stated under Tablets.

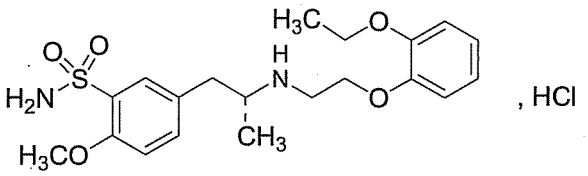
Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 25 mg of tamoxifen, shake with 100 ml of *methanol* for 15 minutes, add sufficient *methanol* to produce 250.0 ml and filter. Dilute 10.0 ml of the filtrate to 100.0 ml with *methanol* and measure the absorbance of the resulting solution at the maximum at about 275 nm (2.4.7).

Calculate the content of $C_{26}H_{29}NO$ taking 325 as the specific absorbance at 275 nm.

Storage. Store protected from light and moisture.

Labelling. The label states the strength in terms of the equivalent amount of tamoxifen.

Tamsulosin Hydrochloride



$C_{20}H_{28}N_2O_5S,HCl$ Mol. Wt. 445.0

Tamsulosin Hydrochloride is (*R*)-5-(2{[2-(*o*-ethoxyphenoxy) ethyl]aminopropyl)-2-methoxybenzenesulfonamide hydrochloride.

Tamsulosin Hydrochloride contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{20}H_{28}N_2O_5S,HCl$, calculated on the dried basis.

Description. A white to off white powder.

Dose. 400 to 800 µg daily.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tamsulosin hydrochloride RS* or with the reference spectrum of tamsulosin hydrochloride.

B. When examined in the range 200 nm to 350 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* shows absorption maxima at about 279 and 225 nm.

C. Dissolve with heating 0.75 g in *water* and dilute to 100 ml with *water*. To 5 ml of the solution, cooled in an ice-bath add 3 ml of *dilute nitric acid* and shake. Allow to stand at room temperature for 30 minutes and filter. The filtrate gives reaction A of chlorides (2.3.1).

Tests

Specific optical rotation (2.4.22). –17.0° to –21.0°, determined in a 0.75 per cent w/v solution.

Related substances. Determine by liquid chromatography (2.4.14).

A. *Test solution*. Dissolve 50.0 mg of the substance under examination in 10 ml of the mobile phase.

Reference solution(a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 4 mg of *2-methoxy-5-[(2R)-2-[(2-(2-methoxyphenoxy)ethyl]amino]propyl]benzenesulphonamide RS* (*tamsulosin impurity A RS*) and 4 mg of the substance under examination in the mobile phase and dilute to 20.0 ml with the mobile phase. Dilute 2.0 ml of this solution to 20.0 ml with the mobile phase.

Reference solution (c). Dissolve 4 mg of *(2R)-N- [2-(2-ethoxyphenoxy)ethyl]-1-(4-methoxyphenyl)propan-2-amine RS* (*tamsulosin impurity B RS*) and 4 mg of the substance under examination in the mobile phase and dilute to 20.0 ml with the mobile phase. Dilute 2.0 ml of this solution to 20.0 ml with the mobile phase

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- column temperature. 40°,
- mobile phase: a mixture of 600 ml of *acetonitrile* and 1400 ml of a solution prepared by dissolving 3.0 g of *sodium hydroxide* in a mixture of 8.7 ml of *perchloric*

acid and 1900 ml of *water*, adjusting the pH to 2.0 with *0.5 M sodium hydroxide* and diluting to 2000 ml with *water*,
- flow rate. 1.3 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume. 10 µl.

Inject the test solution and reference solutions (a) and (b) and record the chromatograms for 1.5 times the retention time of tamsulosin (retention time = about 6 minutes). In the chromatogram obtained with reference solution (b), the resolution between the peaks due to tamsulosin impurity A and tamsulosin is not less than 6.

In the chromatogram obtained with the test solution, for each unspecified impurity eluting before tamsulosin, the area of the peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

B. Repeat the chromatographic procedure with the following modifications.
- mobile phase: dissolve 3.0 g of *sodium hydroxide* in a mixture of 8.7 ml of *perchloric acid* and 900 ml of *water*, adjust the pH to 2.0 with *0.5 M sodium hydroxide* and dilute to 2000 ml with *water*; add 2000 ml of *acetonitrile*,
- flow rate. 1 ml per minute,

Inject the test solution and reference solutions (a) and (c). Run the chromatograms for 5 times the retention time of tamsulosin (retention time = 2.5 minutes). In the chromatogram obtained with reference solution (c), the resolution between the peaks due to tamsulosin and tamsulosin impurity B is not less than 2.

In the chromatogram obtained with the test solution, for each unspecified impurity eluting after tamsulosin, the area of any peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). The sum of the areas of the impurities eluting before tamsulosin in test A and after tamsulosin in test B is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

***S*-isomer**. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.05 g of the substance under examination in *methanol* and add sufficient *methanol* to produce 25.0 ml.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol*. Dilute 1.0 ml of this solution to 10.0 ml with *methanol*.

Reference solution (b). Dissolve 5.0 mg of *tamsulosin racemate RS* in *methanol* and dilute to 25.0 ml with *methanol*. Dilute 2.0 ml of this solution to 10.0 ml with *methanol*.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm packed with silica gel OD for chiral separations (Such as Chiralpak AD-H) (5 µm),
- column temperature. 40°,
- mobile phase: a mixture of 1 volume of *diethylamine*, 150 volumes of *methanol*, 200 volumes of *anhydrous ethanol* and 650 volumes of *hexane*,
- flow rate. 0.5 ml per minute,
- spectrophotometer set at 225 nm,
- injection volume. 10 µl.

Inject reference solution (b). Record the chromatogram for about 20 minutes. The resolution between tamsulosin and impurity C (5-[(2*S*)-2-[[2-(2-ethoxyphenoxy) ethyl]amino] propyl]-2-methoxybenzenesulphonamide) is not less than 2. The relative retention with reference to tamsulosin (retention time = about 14 minutes) of tamsulosin impurity C is about 0.8.

Inject the test solution and reference solution (a). In the chromatogram obtained, the area of the peak obtained due to tamsulosin impurity C is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

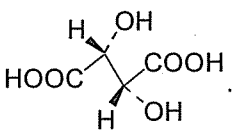
Assay. Weigh accurately about 0.35 g and dissolve in 5.0 ml of *anhydrous formic acid*, add 75 ml of a mixture of 2 volumes of *acetic anhydride* and 3 volumes of *glacial acetic acid*. Titrate immediately with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.0445 g of $C_{20}H_{28}N_2O_5S,HCl$.

Storage. Store protected from light.

Tartaric Acid

L-Tartaric Acid



$C_4H_6O_6$ Mol. Wt. 150.1

Tartaric Acid is (2*R*,3*R*)-2,3-dihydroxybutanedioic acid.

Tartaric Acid contains not less than 99.5 per cent and not more than 101.0 per cent of $C_4H_6O_6$, calculated on the dried basis.

Category. Pharmaceutical aid (buffering agent).

Description. Colourless crystals or a white or almost white crystalline powder.

Identification

A. Ignite a few mg; it gradually decomposes giving off an odour resembling that of burnt sugar (distinction from citric acid).

B. A 10 per cent w/v solution in *distilled water* (solution A) is strongly acidic.

C. Gives reactions A and B of tartrates (2.3.1).

Tests

Appearance of solution. Solution A is clear (2.4.1), and not more intensely coloured than reference solution YS6 (2.4.1).

Specific optical rotation (2.4.22). +12.0° to +12.8°, determined in a 20.0 per cent w/v solution.

Arsenic (2.3.10). Dissolve 5.0 g in 50 ml of *water* and add 10 ml of *stannated hydrochloric acid AsT*. The resulting solution complies with the limit test for arsenic (2 ppm).

Heavy metals (2.3.13). 2.0 g complies with the limit test for heavy metals, Method A (10 ppm).

Chlorides (2.3.12). 20 ml of solution A complies with the limit test for chlorides (125 ppm).

Sulphates (2.3.17). 10 ml of solution A complies with the limit test for sulphates (150 ppm).

Oxalate. Neutralise 10 ml of solution A with *dilute ammonia solution*, add 0.1 ml of *dilute acetic acid* and 10 ml of *calcium sulphate solution*; no opalescence is produced within 20 minutes.

Sulphated ash (2.3.18). Not more than 0.1 per cent.

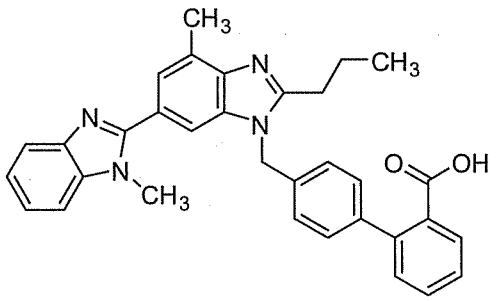
Loss on drying (2.4.19). Not more than 0.2 per cent, determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 1.0 g, dissolve in 25 ml of *water* and titrate with *1 M sodium hydroxide* using 0.5 ml of *phenolphthalein solution* as indicator.

1 ml of *1 M sodium hydroxide* is equivalent to 0.07505 g of $C_4H_6O_6$.

Storage. Store protected from moisture.

Telmisartan



$C_{33}H_{30}N_4O_2$ Mol. Wt. 514.6

Telmisartan is 4′ -{[4-methyl-6-(1-methyl-1*H*-benzimidazol-2-yl)-2-propyl-1*H*-benzimidazol-1-yl]methyl}-2-biphenylcarboxylic acid.

Telmisartan contains not less than 98.0 per cent and not more than 102.0 per cent of $C_{33}H_{30}N_4O_2$, calculated on the dried basis.

Category. Antihypertensive.

Dose. 40 mg once a day.

Description. A white to off-white crystalline powder.

Identification

Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *telmisartan RS* or with the reference spectrum of telmisartan.

Tests

Appearance of solution. A 5 per cent w/v solution in *1 M sodium hydroxide* is not more intensely coloured than reference solution YS4 (2.4.1).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve about 25 mg of the substance under examination in 5 ml of *methanol*, add 100 µl of a 4 per cent w/v solution of *sodium hydroxide* and dilute to 50.0 ml with *methanol*.

Reference solution. Dilute 1.0 ml of the test solution to 10.0 ml with *methanol*. Dilute 1.0 ml of this solution to 100.0 ml with *methanol*.

Chromatographic system

- a stainless steel column 12.5 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm), (Such as Thermoquest),
- column temperature. 40°,
- mobile phase: A. dissolve 2.0 g of *potassium dihydrogen phosphate* and 3.8 g of *sodium pentanesulphonate monohydrate* in *water*, adjusted to pH 3.0 with *orthophosphoric acid* and dilute to 1000 ml with *water*,

B. a mixture of 20 volumes of *methanol* and 80 volumes of *acetonitrile*,

- a linear gradient programme using the conditions given below,
- flow rate. 1 ml per minute,
- spectrophotometer set at 230 nm,
- injection volume. 10 µl.

Time (min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0 - 3	70	30
3 - 28	70→20	30→80
30	70	30

Inject the reference solution. The test is not valid unless the theoretical plates is not less than 2000, tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 2 times the area of the principal peak in the chromatogram obtained with the reference solution (0.2 per cent). The sum of areas of all the secondary peaks is not more than 10 times the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1 g by drying in oven at 105°.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of buffer solution prepared by diluting 5.0 ml of *triethylamine* to 2000 ml with *water* and 20 volumes of *methanol.*

Test solution. Dissolve 40 mg of substance under examination in 100.0 ml of the solvent mixture. Dilute 5.0 ml of the solution to 50.0 ml with the solvent mixture.

Reference solution. A 0.004 per cent w/v solution of *telmisartan RS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (such as Inertsil ODS-3),
- mobile phase: a mixture of 60 volumes of buffer solution prepared by dissolving 2.72 g of *potassium dihydrogen phosphate* in 1000 ml of *water*; add 2 ml of *triethylamine* and adjust the pH to 2.4 with *orthophosphoric acid* and 40 volumes of *acetonitrile*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 298 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the theoretical plates is not less than 3000, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{33}H_{30}N_4O_2$.

Storage. Store protected from light and moisture.

Telmisartan Tablets

Telmisartan Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of telmisartan, $C_{33}H_{30}N_4O_2$.

Usual strengths. 20 mg; 40 mg; 80 mg.

Identification

In the Assay, the retention time of the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1,
Medium. 900 ml of *0.1 M hydrochloric acid,*
Speed and time. 75 rpm and 60 minutes.

Determine by liquid chromatography (2.4.14), as described under Assay using the following solutions.

Solvent mixture. 80 volumes of buffer solution prepared by diluting 5.0 ml of *triethylamine* to 2000 ml with *water* and 20 volumes of *methanol.*

Test solution. Use the filtrate, dilute if necessary with the dissolution medium.

Reference solution. A 0.044 per cent w/v solution of *telmisartan RS* in the solvent mixture. Dilute 5.0 ml of this solution to 100.0 ml with the dissolution medium.

D. Not less than 70 per cent of the stated amount of $C_{33}H_{30}N_4O_2$.

Related substances. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of buffer solution prepared by diluting 5.0 ml of *triethylamine* to 2000 ml with *water* and 20 volumes of *methanol.*

Test solution. Weigh and powder 20 tablets. Disperse a quantity of powder containing about 100 mg of Telmisartan in 100.0 ml of solvent mixture, sonicate for 45 minutes and filter.

Reference solution. A 0.0005 per cent w/v solution of *telmisartan RS* in the solvent mixture.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (such as Inertsil ODS-3),
- mobile phase: A. dissolve 0.5 g of *potassium dihydrogen phosphate* in 1000 ml of *water*; add 2 ml of *triethylamine,* adjusted to pH 3.2 with *orthophosphoric acid,*

  B. *acetonitrile,*
- a linear gradient programme using the conditions given below,
- flow rate. 1.8 ml per minute,
- spectrophotometer set at 298 nm,
- injection volume. 20 µl.

Time (min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	78	22
6	80	20
7	70	30
15	60	40
25	60	40
26	40	60
35	20	80
40	78	22

Inject the reference solution. The test is not valid unless the theoretical plates is not less than 3000, tailing factor is not more than 2.0 and relative standard deviation for replicate injections is not more than 5.0 per cent.

Inject the test solution and the reference solution. In the chromatogram obtained with the test solution the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent), the sum of the area of all the secondary peaks is not more than 4 times the area of the principal peak in the chromatogram obtained with reference solution (2.0 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent).

Other tests. Comply with the tests stated under Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 80 volumes of buffer solution prepared by diluting 5.0 ml of *triethylamine* to 2000 ml with *water* and 20 volumes of *methanol.*

Test solution. Shake 5 intact tablets with 100 ml of the solvent mixture and sonicate for 45 minutes. Dilute to 250 ml with the solvent mixture and filter. Further dilute to obtain 0.004 per cent w/v solution with the solvent mixture.

Reference solution. A 0.004 per cent w/v solution of *telmisartan RS* in the solvent mixture.

Chromatographic system

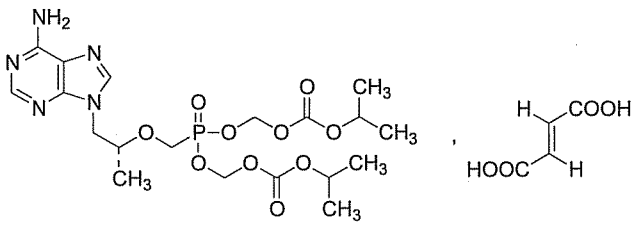
- a stainless steel column 15 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (such as Inertsil ODS-3),
- mobile phase: a mixture of 60 volumes of buffer solution prepared by dissolving 2.72 g of *potassium dihydrogen phosphate* in 1000 ml of *water*; add 2 ml of *triethylamine* and adjust the pH to 2.4 with *orthophosphoric acid* and 40 volumes of *acetonitrile*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 298 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the theoretical plates is not less than 3000, the tailing factor is not more than 2.0 and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{33}H_{30}N_4O_2$ in the tablets.

Tenofovir Disoproxil Fumarate



$C_{19}H_{30}N_5O_{10}P,C_4H_4O_4$ Mol. Wt. 635.5

Tenofovir Disoproxil Fumarate salt of bis(isopropyloxy-carbonyloxymethyl ester of (*R*)-9-(2-phosphonomethoxy-propyl)adenine with fumaric acid.

Tenofovir Disoproxil Fumarate contain not less than 97.0 per cent and not more than 102. 0 per cent of $C_{19}H_{30}N_5O_{10}P,C_4H_4O_4$, calculated on the anhydrous basis.

Category. Antiviral.

Dose. 300 mg daily.

Description. A white to off- white crystalline powder.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *tenofovir disoproxil fumarate RS* or with the reference spectrum of tenofovir disoproxil fumarate.

B. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Dissolve 100 mg of the substance under examination in 50 ml of *methanol*.

Reference solution (a). A 0.2 per cent w/v solution of *tenofovir disoproxil fumarate RS* in *methanol*.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with *methanol*.

Reference solution (c). Dissolve 10 mg of the *fumaric acid* in 50 ml of *methanol*.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as ODS 3V),
- column temperature. 30°,
- mobile phase: A. *0.1 M ammonium acetate solution* with the pH adjusted to 3.8 with *glacial acetic acid*, B. a mixture of 70 volumes of *methanol* and 30 volumes of *acetonitrile*,
- flow rate. 1.5 ml per minute,
- a linear gradient programme using the conditions given below,
- spectrophotometer set at 260 nm,
- injection volume. 10 µl.

Time (in min.)	mobile phase A (per cent v/v)	mobile phase B (per cent v/v)
0	95	5
10	50	50
25	50	50
50	20	80
60	95	5
65	95	5

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 2.0 and the column efficiency in not less than 2000 theoretical plates.

Inject the test solution, reference solution (b) and reference solution (c). In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with the reference solution (b) (1.0 per cent) and the sum of all the secondary peaks is not more than 2.5 times the area of the peak in the chromatogram obtained with the reference solution (b) (2.5 per cent). Ignore any peak corresponding to the peak obtained in the chromatogram in the reference solution (c) and any peak having area less than 0.02 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.02 per cent).

Fumaric Acid. 17.5 per cent to 19.0 per cent.

Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 25 mg of the substance under examination in 100 ml of the mobile phase.

Reference solution. Dissolve 25 mg of the *fumaric acid* in 50 ml of the mobile phase. Dilute 10 ml of the solution to 100 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of *acetonitrile* and 60 volumes of a buffer solution prepared by adding 0.1 per cent v/v of *triethylamine* in *0.05M sodium dihydrogen phosphate* with the pH adjusted to 2.3 with *orthophosphoric acid* and filtered,
- flow rate. 1 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume. 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency in not less than 2000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of fumaric acid.

Water (2.3.43). Not more than 1.0 per cent, determined on 1.0 g.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use and carry out the test protected from light.

Test solution. Dissolve 50 mg of the substance under examination in 50.0 ml of the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. A 0.1 per cent w/v solution of *tenofovir disoproxil fumarate RS* in the mobile phase. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 40 volumes of *acetonitrile* and 60 volumes of a buffer solution prepared by adding 1 ml *triethylamine* to *0.05M sodium dihydrogen phosphate* with the pH adjusted to 2.3 with *orthophosphoric acid* and filtered,
- flow rate. 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency in not less than 2000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{19}H_{30}N_5O_{10}P,C_4H_4O_4$.

Storage. Store protected from light in a refrigerator (2° to 8°).

Tenofovir Disoproxil Fumarate Tablets

Tenofovir Disoproxil Fumarate Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of tenofovir disoproxil fumarate, $C_{19}H_{30}N_5O_{10}P,C_4H_4O_4$.

Usual strength. 300 mg.

Identification

A. In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

B. When examined in the range 200 nm to 400 nm (2.4.7), a 0.001 per cent w/v solution in *methanol* shows an absorption maximum at the same wavelength as the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1,
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes

Withdraw a suitable volume of the medium and filter promptly. Dilute the filtrate, if necessary, with the same solvent. Measure the absorbance (2.4.7) of the resulting solution at the maximum at about 260 nm. Calculate the content of $C_{19}H_{30}N_5O_{10}P,C_4H_4O_4$ in the medium from the absorbance obtained from a solution of known concentration of *tenofovir disoproxil fumarate RS*.

D. Not less than 80 per cent of the stated amount of $C_{19}H_{30}N_5O_{10}P,C_4H_4O_4$.

Related substances. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Test solution. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing 100 mg of Tenofovir Disoproxil Fumarate and disperse in 50 ml of *methanol* and filter.

Reference solution (a). A solution of *tenofovir disoproxil fumarate RS* containing 0.2 per cent of *tenofovir disoproxil* in *methanol*.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with *methanol*.

Reference solution (c). Dissolve 10 mg of *fumaric acid* in 50 ml of *methanol*.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: A. dissolve 1.9 g of *ammonium acetate* in 1000 ml of *water* and adjust the pH to 3.8 with *glacial acetic acid*,
  B. *methanol*,
- flow rate. 1.5 ml per minute,
- a linear gradient programme using the conditions given below,
- spectrophotometer set at 260 nm,
- injection volume. 10 µl.

Time (in min.)	mobile phase A (per cent v/v)	mobile phase B (per cent v/v)
0	95	5
10	50	50
25	50	50
50	20	80
60	95	5

Inject reference solution (a). The test is not valid unless the tailing factor is not more than 2.0 and the column efficiency in not less than 2000 theoretical plates.

Inject the test solution, reference solutions (b) and (c). In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 3.5 times the area of the peak in the chromatogram obtained with the reference solution (b) (3.5 per cent) and the sum of areas of all the secondary peaks is not more than 6 times the area of the peak in the chromatogram obtained with the reference solution (b) (6.0 per cent). Ignore the peak corresponding to the peak in the chromatogram obtained in the reference solution (c).

Other tests. Comply with the tests stated under Tablets.

Water (2.3.43). Not more than 5.0 per cent, determined on 0.5 g.

Assay. Determine by liquid chromatography (2.4.14).

NOTE — Prepare the solutions immediately before use.

Solvent mixture. Equal volumes of *water* and *methanol*.

Test solution. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing 300 mg of Tenofovir Disoproxil Fumarate, dissolve in 100 ml of solvent mixture and filter. Dilute 5.0 ml of the filtrate to 50.0 ml with the mobile phase.

Reference solution. A 0.120 per cent w/v solution of *tenofovir disoproxil fumarate RS* in the solvent mixture. Dilute 5.0 ml of the solution to 20.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm) (Such as Inertsil ODS 3V),
- mobile phase: a mixture of 60 volumes of a buffer solution prepared by dissolving 7.8 g of *sodium dihydrogen orthophosphate* in 1000 ml of *water*, adding 1 ml of *triethylamine* and adjusting the pH to 2.3 with *orthophosphoric acid (10 per cent v/v)*, and 40 volumes of *acetonitrile*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 260 nm,
- injection volume. 10 µl.

Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency in not less than 2000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_{19}H_{30}N_5O_{10}P,C_4H_4O_4$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Tenofovir and Emtricitabine Tablets

Tenofovir Disoproxil Fumarate and Emtricitabine Tablets

Tenofovir and Emtricitabine Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amounts of tenofovir disoproxil fumarate, $C_{19}H_{30}N_5O_{10}P,C_4H_4O_4$ and emtricitabine, $C_8H_{10}FN_3O_3S$.

Usual strength. Tenofovir 300 mg and Emtricitabine 200 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak in the chromatogram obtained with the reference solution.

Tests

Dissolution (2.5.2).

Apparatus No. 1
Medium. 900 ml of *0.1 M hydrochloric acid*,
Speed and time. 50 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter.

Determine by liquid chromatography (2.4.14)

Test solution. The filtrate obtained as given above. Dilute the filtrate if necessary, with the dissolution medium.

Reference solution. A solution containing 0.32 per cent w/v of *tenofovir disoproxil fumarate RS* and 0.24 per cent w/v of *emtricitabine RS* in *methanol*. Dilute 5 ml of the solution to 50 ml with the dissolution medium.

Use the chromatographic system given under Assay.

Inject the test solution and the reference solution.

Calculate the contents of $C_{19}H_{30}N_5O_{10}P.C_4H_4O_4$ and $C_8H_{10}FN_3O_3S$.

D. Not less than 75 per cent of the stated amounts of $C_{19}H_{30}N_5O_{10}P.C_4H_4O_4$ and $C_8H_{10}FN_3O_3S$.

Related substances. Determine by liquid chromatography (2.4.14).

For Emtricitabine

Test solution. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing 50 mg of Emtricitabine, disperse in 5 ml of *methanol*, dilute to 50 ml with mobile phase A and filter.

Reference solution (a). A 0.1 per cent w/v solution of *emtricitabine RS* in mobile phase A.

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with mobile phase A.

Chromatographic system,

- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (5µm),
- column temperature. 35°,
- mobile phase: A. a mixture of 95 volumes of a buffer solution prepared by dissolving 1.9 g of ammonium *acetate* in 1000 ml of *water*, adjusted the pH to 3.8 with *glacial acetic acid*, and 5 volumes of *methanol*,
  B. a filtered mixture of 30 volumes of the buffer solution and 70 volumes of *methanol*,
- flow rate. 1 ml per minute,
- a linear gradient programme using the conditions given below,
- spectrophotometer set at 277 nm,
- injection volume. 20 µl.

Time (in min.)	Mobile phase A (per cent v/v)	Mobile phase B (per cent v/v)
0	100	0
30	100	0
35	0	100
55	0	100
60	100	0
75	100	0

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 500 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution and reference solution (b). In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the peak in the chromatogram obtained with the reference solution (b) (1.0 per cent) and the sum of areas of all the secondary peaks is not more than 3 times the area of the peak in the chromatogram obtained with the reference solution (b) (3.0 per cent).

For Tenofovir Disoproxil Fumarate

Test solution. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing 50 mg of Tenofovir Disoproxil Fumarate and disperse in 50 ml of *methanol.*

Reference solution (a). A 0.1 per cent w/v solution of *tenofovir disoproxil fumarate RS* in *methanol.*

Reference solution (b). Dilute 1 ml of reference solution (a) to 100 ml with *methanol.*

Reference solution (c). Dissolve 10 mg of *fumaric acid* in 50 ml of *methanol.*

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm packed with octadecylsilane bonded to porous silica (5µm),
- mobile phase: A. a buffer solution prepared by dissolving 1.9 g of *ammonium acetate* in 1000 ml of *water* and adjusting the pH to 3.8 with *glacial acetic acid,*

  B. *methanol,*
- flow rate. 1.5 ml per minute,
- a linesr gradient programme using the conditions given below,
- spectrophotometer set at 260 nm,
- injection volume. 20 µl.

Time (in mins)	Mobile phase A (per cent)	Mobile phase B (per cent)
0	95	5
10	50	50
25	50	50
50	20	80
60	95	5
75	95	5

Inject reference solution (a). The test is not valid unless the column efficiency is not less than 2000 theoretical plates and the tailing factor is not more than 2.0.

Inject the test solution, reference solutions (b) and (c). In the chromatogram obtained with the test solution, the area of any secondary peak is not more than 3.5 times the area of the peak in the chromatogram obtained with the reference solution (b) (3.5 per cent) and the sum of areas of all the secondary peaks is not more than 6 times the area of the peak in the chromatogram obtained with the reference solution (b) (6.0 per cent). Ignore the peak corresponding to the peak in the chromatogram obtained in the reference solution (c).

Other tests. Comply with the tests stated under the Tablets.

Assay. Determine by liquid chromatography (2.4.14).

Solvent mixture. 30 volumes of *water* and 70 volumes of *methanol.*

Test solution. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing 100 mg of Tenofovir Disoproxil Fumarate, disperse in 10 ml of *water* and dilute to 250.0 ml with *methanol.* Dilute 5.0 ml of the solution to 25.0 ml with the solvent mixture.

Reference solution. A solution containing 0.025 per cent w/v of *emtricitabine RS* and 0.04 per cent w/v of *tenofovir disoproxil fumarate RS* in *methanol.* Dilute 5.0 ml of the solution to 25.0 ml with the solvent mixture.

Chromatographic system

- a stainless steel column 4.6 mm ξ 5 cm packed with octylsilane bonded to porous silica (3 µm),
- column temperature 40°,
- mobile phase: A. a buffer solution prepared by dissolving 1.35 g of *monobasic potassium phosphate* in 1000 ml of *water* and adjusting the pH to 3.0 with *orthophosphoric acid,*

  B. a mixture of 20 volumes of the buffer solution and 80 volumes of *acetonitrile,*
- flow rate. 1.5 ml per minute,
- a linear gradient programme using the conditions given below,
- spectrophotometer set at 260 nm,
- injection volume. 10 µl.

Time (in mins)	Mobile phase A (per cent)	Mobile phase B (per cent)
0	94	6
3	94	6
5	50	50
8	35	65
9	94	6
12	94	6

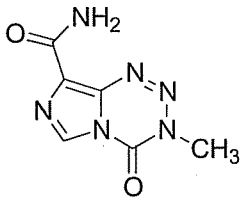
Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency in not less than 2000 theoretical plates for the peak due to tenofovir disoproxil, 500 theoretical plates for the peak due to emtricitabine and the relative standard deviation for replicate injections is not more than 2.0 per cent for each component.

Inject the test solution and the reference solution.

Calculate the contents of $C_{19}H_{30}N_5O_{10}P$,$C_4H_4O_4$ and $C_8H_{10}FN_3O_3S$ in the tablets.

Storage. Store protected from moisture, at a temperature not exceeding 30°.

Temozolomide



$C_6H_6N_6O_2$ Mol. Wt. 194.2

Temozolomide is 3,4-dihydro-3-methyl-4-oxoimidazo[5,1-*d*]-1,2,3,5-tetrazine-8-carboxamide.

Temozolomide contains not less than 98.0 per cent and not more than 102.0 per cent of $C_6H_6N_6O_2$, calculated on the dried basis.

Category. Anticancer.

Dose. 75 mg daily.

Description. A white to almost white powder.

CAUTION — Temozolomide is cytotoxic; extra care required to prevent inhaling particles and exposing the skin to it.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *temozolomide RS* or with the reference spectrum of temozolomide.

B. In the Assay, the principal peak in the chromatogram obtained with test solution (b) corresponds to the peak in the chromatogram obtained with reference solution (a).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 100 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution. Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm), (Such as Hypersil BDS),
- mobile phase: a mixture of 90 volumes of 0.5 per cent w/v solution of *acetic acid* and 10 volumes of *acetronitrile*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 329 nm,
- injection volume. 20 µl.

Inject the reference solution. The test is not valid unless the theoritical plates is not less than 2000 and the tailing factor is not more than 2.0.

Inject the test solution and the reference solution. In the chromatogram obtained with the test solution, area of any secondary peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with the reference solution (0.5 per cent). The sum of areas of all the secondary peaks is not more than the area of the principal peak in the chromatogram obtained with the reference solution (1.0 per cent). Ignore any peak with an area less than 0.1 times the area of the peak in the chromatogram obtained with the reference solution (0.1 per cent).

Heavy metals (2.3.13). 1.0 gm complies with the limit test for heavy metals, Method A (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 gm by drying in an oven at 105° for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 20 mg of the substance under examination in 100.0 ml of the mobile phase.

Reference solution. A 0.02 per cent w/v solution of *temozolomide RS* in the mobile phase.

Use the chromatographic system as described under Related substances.

Inject the reference solution. The test is not valid unless the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_6H_6N_6O_2$.

Storage. Store protected from light and moisture, at a temperature not exceeding 30°.

Temozolomide Capsules

Temozolomide Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of temozolomide, $C_6H_6N_6O_2$.

CAUTION —Temozolomide is cytotoxic; extra care required to prevent inhaling particles and exposing the skin to it.

Usual strengths. 20 mg; 100 mg; 250 mg.

Identification

In the Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the principal peak in the chromatogram obtained with reference solution.

Other tests. Complies with tests stated under capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh accurately a quantity of mixed contents of 20 capsules containing 20 mg of Temozolomide in 100.0 ml of mobile phase.

Reference solution. A 0.02 per cent w/v solution of *temozolomide RS* in the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octadecylsilane bonded to porous silica (5 µm), (such as Hypersil BDS),
- mobile phase: a mixture of 90 volumes of 0.5 per cent v/v *acetic acid* and 10 ml volumes of *acetonitrile*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 329 nm,
- injection volume. 20 µl.

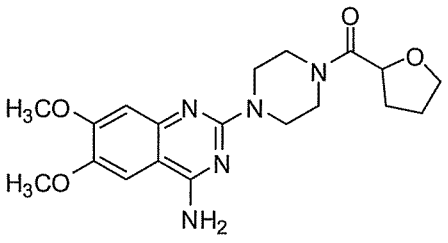
Inject the reference solution. The test is not valid unless the tailing factor is not more than 2.0, the column efficiency is not less than 2000 theoretical plates and the relative standard deviation for replicate injections is not more than 2.0 per cent.

Inject the test solution and the reference solution.

Calculate the content of $C_6H_6N_6O_2$ in the capsules.

Storage. Store protected from light and moisture.

Terazosin Hydrochloride



, HCl , $2H_2O$

$C_{19}H_{25}N_5O_4,HCl,2H_2O$ Mol. Wt. 459.9

Terazosin Hydrochloride is (*RS*)-6,7-dimethoxy-2-[4-(tetrahydrofuran-2-carbonyl)piperazin-1-yl}quinazolin-4-ylamine hydrochloride dihydrate.

Terazosin Hydrochloride contains not less than 99.0 per cent and not more than 101.0 per cent of $C_{19}H_{25}N_5O_4,HCl$, calculated on the anhydrous basis.

Category. Antihypertensive.

Description. A white or slightly yellow, crystalline powder.

Dose. 1 mg daily.

Identification

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *terazosin hydrochloride RS* or with the reference spectrum of terazosin hydrochloride.

B. Gives reaction A of chlorides (2.3.1).

Tests

Appearance of solution. A 1.0 per cent w/v solution in *carbon-dioxide free water* is clear (2.4.1) and not more intensely coloured than reference solution YS7 (2.4.1).

pH (2.4.24). 3.0 to 5.0, determined in 2.0 per cent w/v solution in *carbon-dioxide free water.*

Impurities N and O. Determine by liquid chromatography (2.4.14).

Solvent mixture. 20 volumes of *acetonitrile* and 80 volumes of *water.*

Test solution. Dissolve 50 mg of the substance under examination in 50 ml of the solvent mixture.

Reference solution (a). Dissolve 5 mg each of *2-chloro-6,7-dimethoxyquinazolin-4-amine RS (terazosin impurity A RS)* and *1-[[(2RS)-tetrahydrofuran-2-yl]carbonyl]piperazine RS (terazosin impurity N RS)* in *acetonitrile*, add 5 ml of the test solution and dilute to 50 ml with *acetonitrile.* Dilute 10 ml of this solution to 100 ml with the solvent mixture.

Reference solution (b). Dilute 10 ml of reference solution (a) to 100 ml with the solvent mixture.

Chromatographic system
- a stainless steel column 25 cm x 4.0 mm, packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: dissolve 2.8 g of *sodium laurylsulphate* in 1000 ml of *water* and add 11 ml of a solution containing 20.24 per cent w/v of *triethylamine* and 23.0 per cent w/v of *orthophosphoric acid* and adjust the pH to 2.5 with *orthophosphoric acid*; mix 60 volumes of this solution with 40 volumes of *acetonitrile,*
- flow rate. 1.0 ml per minute,
- spectrophotometer set at 210 nm,
- injection volume. 20 µl.

Inject reference solution (b). The relative retention time with reference to terazosin for 1,4-bis[(tetrahydrofuran-2-yl)carbonyl]piperazine (terazosin impurity O) is about 0.2, for

terazosin impurity N is about 0.3 and for terazosin impurity A is about 0.4. The test is not valid unless the resolution between the peaks due to terazosin impurity A and N is not less than 1.5.

Inject the test solution and reference solution (b). Run the chromatogram 4 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of each peak corresponding to terazosin impurity N and terazosin impurity O is not more than the area of the peak due to terazosin in the chromatogram obtained with reference solution (b) (0.1 per cent).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in 100 ml of the mobile phase.

Reference solution (a). Dilute 2.0 ml of the test solution to 100 ml with the mobile phase. Dilute 5.0 ml of this solution to 100 ml with the mobile phase.

Reference solution (b). Dissolve the contents of a vial of *terazosin for system suitability RS* (containing terazosin impurity A, terazosin impurity B (1-(4-hydroxy-6,7-dimethoxyquinazolin-2-yl)-4-[[(2*RS*)- tetrahydrofuran-2-yl]carbonyl]piperazine), terazosin impurity C (6,7-dimethoxy-2-(piperazin-1-yl)quinazolin-4-amine), terazosin impurity J (1-(4-amino-6,7-dimethoxyquinazolin-2-yl)-4-[(2*RS*)-2-hydroxypentanoyl]piperazine), terazosin impurity K (prazosin) and terazosin impurity M (1,4-bis(furan-2-ylcarbonyl) piperazine) in 10 ml of the mobile phase.

Reference solution (c). Dissolve 5 mg of *1-(furan-2-ylcarbonyl)piperazine RS (terazosin impurity L RS)* in 100 ml of the mobile phase. Dilute 1.0 ml of this solution to 100 ml with the mobile phase.

Reference solution (d). To 5 mg of *2,2-(piperazine-1,4-diyl)bis(6,7-dimethoxyquinazolin-4-amine) RS (terazosin impurity E RS*) add 70 ml of *methanol* and 30 ml of *water.* Allow to stand for at least 1 hour to dissolve the substance.

Chrmatographic system

- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 µm),
- column temperature. 30°,
- mobile phase: mix 2 volumes of *triethylamine*, 350 volumes of *acetonitrile*, and 1650 volumes of a solution containing 0.6 per cent w/v of *sodium citrate* and 1.425 per cent w/v of *anhydrous citric acid,*
- flow rate. 1 ml per minute,
- spectrophotometer set at 245 nm,
- injection volume. 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to terazosin impurity B and terazosin impurity J is not less than 1.5.

Inject the test solution, reference solution (a) and (c). Run the chromatogram 4 times the retention time of the principal peak. In the chromatogram obtained with the test solution the area of secondary peak corresponding to terazosin impurity A, C, E and K is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). The area of secondary peak corresponding to terazosin impurity L is not more than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.1 per cent). The area of secondary peak corresponding to terazosin impurity B, J, M is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). Multiply the peak areas of the impuirites by the correction factor for calculating the contents, for impuirty C is 0.7 and for impuirty M is 1.6. The area of any other secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent); The sum of the areas of all other secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13). 1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

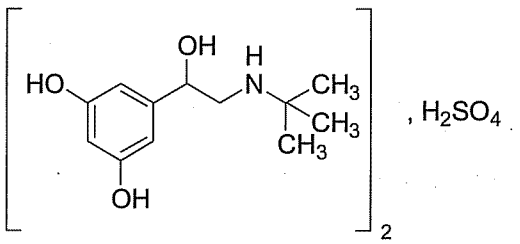
Water (2.3.43). 7.8 to 8.6 per cent, determined on 0.2 g.

Assay. Weigh accurately about 0.3 g , dissolve in a mixture of 5 ml of *0.01 M hydrochloric acid* and 50 ml of *methanol.* Titrate with *0.1 M sodium hydroxide*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.04239 g of $C_{19}H_{26}ClN_5O_4$.

Storage. Store protected from light.

Terbutaline Sulphate



$(C_{12}H_{19}NO_3)_2,H_2SO_4$ Mol. Wt. 548.7

Terbutaline Sulphate is (*RS*)-2-(*tert*-butylamino)-1-(3,5-dihydroxyphenyl)ethanol sulphate.

Terbutaline Sulphate contains not less than 98.0 per cent and not more than 101.0 per cent of $(C_{12}H_{19}NO_3)_2, H_2SO_4$, calculated on the dried basis.

Category. Beta-adrenoceptor agonist.

Dose. Orally, upto 15 mg daily, in divided doses; by inhalation, for an adult, one to two inhalations, each of 250 µg, 3 or 4 times a day up to a maximum of 24 inhalations in 24 hours; for a child, one to two inhalations, each of 250 µg, 2 or 3 times a day up to a maximum of 10 inhalations in 24 hours; by subcutaneous injection, 250 to 500 µg, 4 times a day.

Description. A white or almost white, crystalline powder; odourless or almost odourless.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and C may be omitted if tests A and D are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *terbutaline sulphate RS* or with the reference spectrum of terbutaline sulphate.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.007 per cent w/v solution in *0.1 M hydrochloric acid* shows absorption maxima at about 276 nm and 280 nm, which may be fused; absorbance at both 276 nm and 280 nm, 0.46 to 0.49.

C. In the test for Related substances, the principal spot in the chromatogram obtained with test solution (b) corresponds to that in the chromatogram obtained with reference solution (b).

D. A 2.0 per cent w/v solution in *carbon dioxide-free water* gives reaction A of sulphates (2.3.1).

Tests

Appearance of solution. A 2.0 per cent w/v solution in *carbon dioxide-free water* is clear (2.4.1); absorbance of a 2-cm layer at 400 nm, not more than 0.11 (2.4.7).

Acidity. Dissolve 0.2 g in 10 ml of *carbon dioxide-free water* and titrate with *0.01 M sodium hydroxide*, using *methyl red solution* as indicator. Not more than 1.2 ml of *0.01 M sodium hydroxide* is required to change the colour of the solution to yellow.

tert-Butylamino-3,5-dihydroxyacetophenone. Absorbance of a 2 per cent w/v solution in *0.01 M hydrochloric acid* at about 330 nm, not more than 0.50 (2.4.7).

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 75 mg of the substance under examination 50.0 ml of the mobile phase.

Reference solution (a). Dissolve 7.5 mg of *1-(3,5-dihydroxyphenyl)-2-[(1,1-dimethylethyl)amino]ethanone RS (terbutaline impurity C RS)* and 22.5 mg of *terbutaline sulphate RS* in 50.0 ml of the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 2.0 ml of this solution to 20.0 ml with the mobile phase.

Chromatographic system

- a stainless steel column 15 cm x 4.6 mm, packed with endcapped octadecylsilane bonded to porous silica (5 µm),
- mobile phase. dissolve 4.23 g of *sodium hexanesulphonate* in 770 ml of *0.05 M ammonium formate solution* prepared by dissolving 3.15 g of *ammonium formate* in about 980 ml of *water,* adjusted to pH 3.0 by *anhydrous formic acid* and dilute to 1000 ml with *water* and add 230 ml of *methanol*,
- flow rate. 1 ml per minute,
- spectrophotometer set at 276 nm,
- injection volume. 20 µl.

Inject reference solution (a). The test is not valid unless the resolution between the peaks due to terbutaline impurity C and terbutaline is not less than 2.0.

Inject the test solution, reference solution (a) and (b). Run the chromatogram 6 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of the peak due to terbutaline impurity C is not more than twice area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.2 per cent), the area of each peak due to 3,5-dihydroxybenzoic acid (á-resorcylic acid) (terbutaline impurity A), (4*RS*)-2-(1,1-dimethylethyl)-1,2,3,4-tetrahydroisoquinoline-4,6,8-triol (terbutaline impurity B) and 2-[benzyl-(1,1-dimethylethyl)amino]-1-(3,5-dihydroxyphenyl) ethanone (terbutaline impurity D) is not more than area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent). The sum of all the secondary peaks other than terbutaline impurity C is not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent). Ignore any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.02 per cent).

Heavy metals (2.3.13). Mix 1.6 g with 0.6 g of *anhydrous sodium sulphate* and ignite without melting the sodium sulphate. Cool, add 3 ml of *2 M hydrochloric acid*, boil and dilute to 50 ml with *water*. Cool and filter, 25 ml of the filtrate complies with the limit test for heavy metals, Method A (25 ppm).

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 3 hours.

Assay. Weigh accurately about 0.5 g, dissolve in 60 ml of *anhydrous glacial acetic acid* with the aid of heat. Titrate

with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.4.25). Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 0.05486 g of $(C_{12}H_{19}NO_3)_2, H_2SO_4$.

Storage. Store protected from light and moisture.

Terbutaline Inhalation

Terbutaline Sulphate Inhalation; Terbutaline Inhalation Aerosol; Terbutaline Sulphate Inhalation Aerosol

Terbutaline Inhalation is a suspension of Terbutaline Sulphate, as a superfine powder, in a suitable liquid in a suitable pressurised container. It may contain suitable pharmaceutical aids such as surfactants, stabilising agents, etc.

Terbutaline Inhalation delivers not less than 75.0 per cent and not more than 125.0 per cent of the stated amount of terbutaline sulphate $(C_{12}H_{19}NO_3)_2,H_2SO_4$, per inhalation, by actuation of the valve.

Usual strength. 250 µg in each metered dose.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel GF254*.

Mobile phase. A mixture of 65 volumes of *2-propanol*, 25 volumes of *cyclohexane* and 5 volumes of *formic acid*.

Test solution. Remove the actuator from the pressurised container, shake the container for about 30 seconds and place it in an inverted position in a small beaker containing 5 ml of *water*. Discharge a sufficient number of deliveries containing 5 mg of Terbutaline Sulphate, under the surface of the solvent.

Reference solution. A 0.1 per cent w/v solution of *terbutaline sulphate RS* in *water*.

Apply to the plate 2 µl of each solution. After development, dry the plate in air, spray with a 2 per cent w/v solution of *4-aminoantipyrine* in *methanol*. Examine in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to the chromatogram obtained with reference solution.

Tests

Other tests. Complies with the tests stated under Inhalation Preparations (Pressurised metered-dose Preparations).

Follow the procedure described under Assay wherever the amount of active substance is to be determined in any test.

Assay. Carry out the test for Content of active ingredient delivered per actuation stated under Inhalation Preparations (Pressurised metered-dose Preparations).

Use 35 ml of *water* and finally dilute to 50.0 ml with *water*. Dilute a suitable volume of this solution with *water* to produce a solution containing 50 µg of Terbutaline Sulphate per ml. To 10.0 ml of this solution in a 50-ml volumetric flask add 35 ml of *buffer solution pH 9.5* and 1.0 ml of *4-aminoantipyrine solution*. Mix, add 1.0 ml of *potassium ferricyanide solution* with vigorous swirling of the flask, dilute to volume with *water* and mix. Exactly 75 seconds after the addition of the *potassium ferricyanide solution* measure the absorbance of the resulting solution at the maximum at about 550 nm (2.4.7), using as the blank a solution prepared in the same manner using 10.0 ml of *water* in place of the solution of the substance under examination.

Calculate the content of $(C_{12}H_{19}NO_3)_2,H_2SO_4$ in the solution from the absorbance obtained by repeating the operation using a solution containing 100 µg of *terbutaline sulphate RS* in place of the solution of the substance under examination.

Calculate the amount of $(C_{12}H_{19}NO_3)_2,H_2SO_4$ delivered per actuation of the valve.

Determine the content of active ingredient a second and third time by repeating the procedure on the middle ten and on the last ten successive combined actuations of the valve. For each of the three determinations the average content of $(C_{12}H_{19}NO_3)_2,H_2SO_4$ delivered per actuation of the valve meets the requirements.

Storage. Store protected from moisture at a temperature not exceeding 30°.

Labelling. The label states the amount of active ingredient delivered per inhalation.

Terbutaline Injection

Terbutaline Sulphate Injection

Terbutaline Injection is a sterile solution of Terbutaline Sulphate in Water for Injections.

Terbutaline Injection contains not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of terbutaline sulphate $(C_{12}H_{19}NO_3)_2, H_2SO_4$.

Usual strength. 500 µg per ml.

Identification

Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Mobile phase. A mixture of 65 volumes of *2-propanol*, 25 volumes of *cyclohexane* and 5 volumes of *formic acid*.

Test solution. Use the injection.

Reference solution. A 0.1 per cent w/v solution of *terbutaline sulphate RS* in *saline solution.*

Apply to the plate 2 µl of each solution. After development, dry the plate in air, spray with a 2 per cent w/v solution of *4-aminoantipyrine* in *methanol.* Dry the plate in air and spray with a freshly prepared 8.0 per cent w/v solution of *potassium ferricyanide* in a mixture of 4 volumes of *strong ammonia solution* and 1 volume of *water.* The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with the reference solution.

Tests

pH (2.4.24). 3.0 to 5.0.

Other tests. Complies with the tests stated under Parenteral preparations (Injections).

Assay. Measure accurately a volume containing about 5 mg of Terbutaline Sulphate and add sufficient *water* to produce 50.0 ml. To 5.0 ml add 35 ml of a buffer solution prepared by dissolving 36.3 g of *tris (hydroxymethyl) aminomethane* in 900 ml of *water*, adjusting the pH to between 9.4 and 9.6 and adding sufficient *water* to produce 1000 ml. Add 1.0 ml of a freshly prepared 2.0 per cent w/v solution of *4-aminoantipyrine*, mix and add 1.0 ml of a freshly prepared 8.0 per cent w/v solution of *potassium ferricyanide* with vigorous swirling and sufficient of the buffer solution to produce 50.0 ml. Exactly 75 seconds after the addition of the *potassium ferricyanide solution* measure the absorbance of the resulting solution at the maximum at about 550 nm (2.4.7), using *water* as the blank.

Calculate the content of $(C_{12}H_{19}NO_3)_2$, H_2SO_4 from the absorbance obtained by repeating the operation using a 0.01 per cent w/v solution of *terbutaline sulphate RS* and beginning at the words "To 5.0 ml add 35 ml.....".

Storage. Store protected from light, in single dose containers.

Labelling. The label states that the injection should not be used if the solution is discoloured.

Terbutaline Tablets

Terbutaline Sulphate Tablets

Terbutaline Tablets contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of terbutaline sulphate $(C_{12}H_{19}NO_3)_2$, H_2SO_4.

Usual strengths. 2.5 mg; 5 mg.

Identification

A. Shake a quantity of the powdered tablets containing 20 mg of Terbutaline Sulphate with 50 ml of *0.1 M sodium hydroxide* for 10 minutes, dilute to 100 ml with *0.1 M sodium hydroxide* and filter. Dilute 20 ml of the filtrate to 50 ml with *0.1 M sodium hydroxide.*

When examined in the range 230 nm to 360 nm (2.4.7), the resulting solution shows an absorption maximum at about 296 nm.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G.*

Mobile phase. A mixture of 65 volumes of *2-propanol*, 25 volumes of *cyclohexane* and 5 volumes of *formic acid.*

Test solution. Shake a quantity of the powdered tablets containing 10 mg of Terbutaline Sulphate with 4 ml of a mixture of equal volumes of *ethanol (95 per cent)* and *water* for 10 minutes, centrifuge and use the clear supernatant liquid.

Reference solution (a). A 0.25 per cent w/v solution of *terbutaline sulphate RS* in *water.*

Reference solution (b). A mixture of equal volumes of the test solution and reference solution (a).

Apply to the plate 2 µl of each solution. After development, dry the plate in air, allow to stand for a few minutes in an atmosphere saturated with *diethylamine* and spray with *diazotised nitroaniline solution.* The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a) and the principal spot in the chromatogram obtained with reference solution (b) appears as a single compact spot.

Tests

Dissolution (2.5.2).

Apparatus No. 2,
Medium. 900 ml of *water*,
Speed and time. 100 rpm and 45 minutes.

Withdraw a suitable volume of the medium and filter. Measure the absorbance of the filtered solution, suitably diluted with the medium if necessary, at the maximum at about 550 nm (2.4.7). Calculate the content of $(C_{12}H_{19}NO_3)_2.H_2SO_4$ in the medium from the absorbance obtained from a solution of known concentration of *terbutaline RS* in the same medium.

D. Not less than 70 per cent of the stated amount of $(C_{12}H_{19}NO_3)_2.H_2SO_4$.

Uniformity of content. Comply with the test stated under Tablets.

Powder one tablet, transfer to a 25-ml volumetric flask, add 15 ml of *0.01 M hydrochloric acid* and shake for 10 minutes. Dilute to volume with *0.01 M hydrochloric acid* and filter, rejecting the first 5 ml of the filtrate. Dilute, if necessary, a suitable volume of the filtrate with *0.01 M hydrochloric acid* to produce a solution containing 0.01 per cent w/v solution of

Terbutaline Sulphate. Carry out the method as described under Assay beginning at the words "To 5.0 ml add 35 ml of a buffer solution....". Calculate the content of $(C_{12}H_{19}NO_3)_2$, H_2SO_4 in the tablet from the absorbance obtained by carrying out the Assay simultaneously using *terbutaline sulphate RS*.

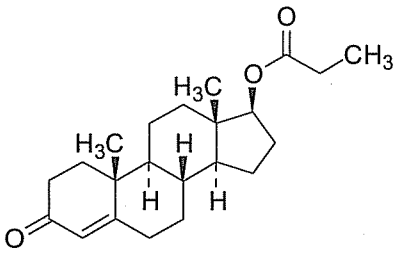
Other tests. Comply with the tests stated under Tablets.

Assay. Weigh and powder 20 tablets. Weigh accurately a quantity of the powder containing about 5 mg of Terbutaline Sulphate, transfer to a 50-ml volumetric flask, add 30 ml of *0.01 M hydrochloric acid* and shake for 10 minutes. Dilute to volume with *0.01 M hydrochloric acid* and filter, rejecting the first 5 ml of the filtrate. To 5.0 ml add 35 ml of a buffer solution prepared by dissolving 36.3 g of *tris (hydroxymethyl) aminomethane* in 900 ml of *water*, adjusting the pH to between 9.4 and 9.6 and adding sufficient *water* to produce 1000 ml. Add 1.0 ml of a freshly prepared 2.0 per cent w/v solution of *4-aminoantipyrine*, mix and add 1.0 ml of a freshly prepared 8.0 per cent w/v solution of *potassium ferricyanide* with vigorous swirling and sufficient of the buffer solution to produce 50.0 ml. Exactly 75 seconds after the addition of the *potassium ferricyanide solution* measure the absorbance of the resulting solution at the maximum at about 550 nm (2.4.7), using *water* as the blank.

Calculate the content of $(C_{12}H_{19}NO_3)_2$, H_2SO_4 from the absorbance obtained by carrying out the Assay simultaneously using *terbutaline sulphate RS*.

Storage. Store protected from light and moisture.

Testosterone Propionate



$C_{22}H_{32}O_3$ Mol. Wt. 344.5

Testosterone Propionate is 3-oxoandrost-4-en-17β-yl propionate.

Testosterone Propionate contains not less than 97.0 per cent and not more than 103.0 per cent of $C_{22}H_{32}O_3$, calculated on the dried basis.

Category. Androgen; anabolic steroid.

Dose. By intramuscular injection, 5 to 25 mg, once or twice weekly.

Description. A white or almost white powder or colourless crystals; odourless.

Identification

Test A may be omitted if tests B and C are carried out. Tests B and C may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *testosterone propionate RS* or with the reference spectrum of testosterone propionate.

B. In the test for Related substances the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to testosterone propionate in the chromatogram obtained with reference solution (a).

C. Melting range. 119° to 123° (2.4.21).

Tests

Specific optical rotation (2.4.22). +83.0° to +90.0°, determined in a 1.0 per cent w/v solution in *ethanol*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 50 mg of the substance under examination in *methanol* and dilute to 50 ml with the same solvent.

Reference solution (a). Dissolve 2 mg of the substance under examination and 2 mg of *testosterone acetate RS* in *methanol* and dilute to 50 ml with the same solvent.

Reference solution (b). Dilute 1 ml of the test solution to 100 ml with *methanol*.

Chromatographic system

- a stainless steel column 25 cm × 4.6 mm packed with octadecylsilane bonded to porous silica (5 µm),
- mobile phase: a mixture of 20 volumes of *water* and 80 volumes of *methanol*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 254 nm,
- injection volume. 20 µl.

Inject the test solution and the reference solutions. Continue the chromatography for twice the retention time for testosterone propionate.

The relative retention time of about four impurities with reference to testosterone propionate (retention time, about 9 minutes) range from 0.5 to about 1.4.

The test is not valid unless in the chromatogram obtained with reference solution (a) the resolution between the peaks due to testosterone and testosterone acetate is not less than 4.0.

In the chromatogram obtained with the test solution the area of any peak other than the principal peak is not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of any secondary peaks is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent). Ignore any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent, determined on 1.0 g by drying in an oven at 105° for 2 hours.

Assay. Weigh accurately about 25 mg, dissolve in sufficient *ethanol* to produce 250.0 ml, mix, dilute 5.0 ml to 50.0 ml with the same solvent and measure the absorbance of the resulting solution at the maximum at about 241 nm (2.4.7).

Calculate the content of $C_{22}H_{32}O_3$ taking 490 as the specific absorbance at 241 nm.

Storage. Store protected from light and moisture.

Testosterone Propionate Injection

Testosterone Propionate Injection is a sterile solution of Testosterone Propionate in Ethyl Oleate or any other suitable ester, in a suitable fixed oil or in any mixture of these.

Testosterone Propionate Injection contains not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of testosterone propionate, $C_{22}H_{32}O_3$.

Usual strength. 25 mg per ml; 50 mg per ml.

Identification

Dissolve a volume containing 50 mg of Testosterone Propionate in 8 ml of *light petroleum (40° to 60°)* and extract with three quantities, each of 8 ml, of a mixture of 7 volumes of *glacial acetic acid* and 3 volumes of *water*. Wash the combined extracts with 10 ml of *light petroleum (40° to 60°)*, dilute with *water* until the solution becomes turbid, allow to stand for 2 hours in ice and filter. The precipitate, after washing with *water* and drying at 105°, complies with the following tests.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *testosterone propionate RS* or with the reference spectrum of testosterone propionate.

B. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel G*.

Solvent mixture. A mixture of 90 volumes of *light petroleum (40° to 60°)* and 10 volumes of *liquid paraffin*.

Mobile phase. A mixture of 30 volumes of *water* and 20 volumes of *glacial acetic acid*.

Test solution. Dissolve 25 mg of the residue in 10 ml of the solvent mixture.

Reference solution (a). A 0.25 per cent w/v solution of *testosterone propionate RS* in the solvent mixture.

Reference solution (b). Mix equal volumes of the test solution and reference solution (a).

Place the dry plate in a tank containing a shallow layer of the solvent mixture, allow the solvent mixture to ascend to the top, remove the plate from the tank and allow the solvent to evaporate. Use within 2 hours, with the flow of the mobile phase in the direction in which the aforementioned treatment was done.

Apply to the plate 2 µl of each solution. Allow the mobile phase to rise 12 cm. Dry the plate in a current of warm air, allow the solvent to evaporate, heat at 120° for 15 minutes and spray the hot plate with *ethanolic sulphuric acid (20 per cent v/v)*. Heat at 120° for a further 10 minutes, allow to cool and examine in daylight and in ultraviolet light at 365 nm. The principal spot in the chromatogram obtained with the test solution corresponds to that in the chromatogram obtained with reference solution (a). The principal spot in the chromatogram obtained with reference solution (b) appears as a single, compact spot A.

Tests

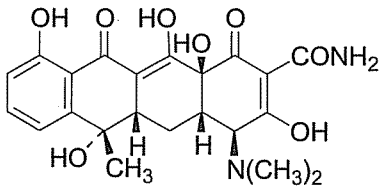
Other tests. Complies with the tests stated under Parenteral preparations (Injections).

Assay. To an accurately measured volume containing about 0.1 g of Testosterone Propionate add sufficient *chloroform* to produce 100.0 ml and mix. Dilute 3.0 ml to 50.0 ml with *chloroform* and to 5.0 ml of the solution add 10 ml of *isoniazid solution* and sufficient *methanol* to produce 20.0 ml. Allow to stand for 45 minutes and measure the absorbance of the resulting solution at the maximum at about 380 nm (2.4.7), using as the blank a solution prepared by treating 5 ml of *chloroform* in the same manner.

Calculate the content of $C_{22}H_{32}O_3$ from the absorbance obtained by repeating the operation using a 0.006 per cent w/v solution of *testosterone propionate RS* in *chloroform* and beginning at the words "to 5.0 ml of the solution.....".

Storage. Store protected from light.

Tetracycline



$C_{22}H_{24}N_2O_8$ Mol. Wt. 444.5

Tetracycline is (4*S*,4a*S*,5a*S*,6*S*,12a*S*)-4-dimethylamino-1,4,4a,5,5a,6,11,12a-octahydro-3,6,10,12,12a-pentahydroxy-6-methyl-1,11-dioxonaphthacene-2-carboxamide. It contains a variable quantity of water.

Tetracycline contains not less than 88.0 per cent of $C_{22}H_{24}N_2O_8$, calculated on the dried basis.

Category. Antibacterial.

Dose. Orally, 250 mg every 6 hours, increased in severe infections to 500 mg every 6 to 8 hours.

Description. A yellow, crystalline powder.

Identification

A. In the test for Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to tetracycline hydrochloride in the chromatogram obtained with reference solution (a).

B. To about 2 mg add 5 ml of *sulphuric acid*; a reddish violet colour develops. Add the solution to 2.5 ml of *water*; the colour changes to yellow.

C. Dissolve about 10 mg in a mixture of 1 ml of *2 M nitric acid* and 5 ml of *water*, shake well and add 1 ml of *silver nitrate solution*. Any opalescence produced is not more intense than that in a solution prepared in the same manner omitting the substance under examination.

Tests

pH (2.4.24). 3.5 to 6.0, determined in a 1.0 per cent w/v suspension in *carbon dioxide-free water*.

Specific optical rotation (2.4.22).–260° to –280°, determined at 20° in a 1.0 per cent w/v solution in *0.1 M hydrochloric acid*.

Related substances. Determine by liquid chromatography (2.4.14)

Test solution. Dissolve 0.1 g of the substance under examination in 100 ml of a mixture of 68 ml of *0.1 M ammonium oxalate* and 27 ml of *dimethylformamide* (diluting solvent).

Reference solution (a). A 0.0025 per cent w/v solution of *4-epitetracycline hydrochloride RS* in the diluting solvent.

Reference solution (b). A solution containing 0.0025 per cent w/v of *4-epitetracycline hydrochloride RS* and 0.01 per cent w/v of *tetracycline hydrochloride RS* in the diluting solvent.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 to 10 µm),
- mobile phase: a mixture of 680 ml of *0.1 M ammonium oxalate*, 270 ml of *dimethylformamide* and 50 ml of *0.2 M dibasic ammonium phosphate*, the pH of the mixture being adjusted, if necessary, to 7.6 to 7.7 with *3 M ammonia* or *3 M phosphoric acid*,
- flow rate. 2 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume. 20 µl.

The test is not valid unless the resolution between the two principal peaks in the chromatogram obtained with reference solution (b) is not less than 1.5. In the chromatogram obtained with the test solution, the area of any peak corresponding to 4-epitetracycline is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) and the total area of all the peaks other than the principal peak is not greater than 5.0 per cent.

Heavy metals (2.3.13). 0.5 g complies with the limit test for heavy metals, Method B (50 ppm). Use 2.5 ml of *lead standard solution (10 ppm Pb)* to prepare the standard.

Sulphated ash (2.3.18). Not more than 0.5 per cent.

Loss on drying (2.4.19). Not more than 13.0 per cent, determined on 0.5 g by drying in an oven at 105°.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh accurately about 50 mg of the substance under examination and dissolve in 100.0 ml of a mixture of 68 ml of *0.1 M ammonium oxalate* and 27 ml of *dimethylformamide* (diluting solvent).

Reference solution (a). A 0.05 per cent w/v solution of *tetracycline hydrochloride RS* in the diluting solvent.

Reference solution (b). A solution containing 0.0025 per cent w/v of *4-epitetracycline hydrochloride RS* and 0.01 per cent w/v of *tetracycline hydrochloride RS* in the diluting solvent.

Chromatographic system
- a stainless steel column 25 cm x 4.6 mm, packed with octylsilane bonded to porous silica (5 to 10 µm),
- mobile phase: a mixture of 680 ml of *0.1 M ammonium oxalate*, 270 ml of *dimethylformamide* and 50 ml of *0.2 M dibasic ammonium phosphate*, the pH of the mixture being adjusted, if necessary, to 7.6 to 7.7 with *3 M ammonia* or *3 M phosphoric acid*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume. 20 µl.

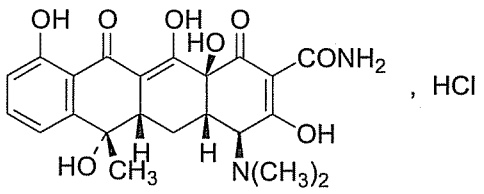
The test is not valid unless the resolution between the two principal peaks in the chromatogram obtained with reference solution (b) is not less than 1.5.

Calculate the content of $C_{22}H_{24}N_2O_8$.

1 mg of $C_{22}H_{24}N_2O_8$, HCl is equivalent to 0.92 mg of $C_{22}H_{24}N_2O_8$.

Storage. Store protected from light and moisture.

Tetracycline Hydrochloride



$C_{22}H_{24}N_2O_8$,HCl Mol. Wt. 480.9

Tetracycline Hydrochloride is (4*S*,4a*S*,5a*S*,6*S*,12a*S*)-4- dimethylamino-1,4,4a,5,5a,6,11,12a-octahydro-3,6,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-naphthacene-2- carboxamide hydrochloride.

Tetracycline Hydrochloride contains not less than 95.0 per cent and not more than 100.5 per cent of $C_{22}H_{24}N_2O_8$, HCl, calculated on the dried basis.

Category. Antibacterial.

Dose. Orally, 250 mg every 6 hours, increased in severe infections to 500 mg every 6 to 8 hours; by intramuscular injection, 100 mg every 8 to 12 hours, increased in severe infections to every 4 to 6 hours; by intravenous infusion, 500 mg every 12 hours; maximum 2 g daily.

Description. A yellow, crystalline powder.

Identification

A. In the test for Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to tetracycline hydrochloride in the chromatogram obtained with reference solution (a).

B. To about 2 mg add 5 ml of *sulphuric acid*; a reddish violet colour develops. Add the solution to 2.5 ml of *water*; the colour changes to yellow.

C. Gives reaction A of chlorides (2.3.1).

Tests

pH (2.4.24). 1.8 to 3.0, determined in a 1.0 per cent w/v suspension in *carbon dioxide-free water*.

Specific optical rotation (2.4.22). –239° to –255°, determined at 20° in a 1.0 per cent w/v solution in *0.1 M hydrochloric acid*.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 0.1 g of the substance under examination in 100 ml of a mixture of 68 ml of *0.1 M ammonium oxalate* and 27 ml of *dimethylformamide* (diluting solvent).

Reference solution (a). A 0.0025 per cent w/v solution of *4-epitetracycline hydrochloride RS* in the diluting solvent.

Reference solution (b). A solution containing 0.0025 per cent w/v of *4-epitetracycline hydrochloride RS* and 0.01 per cent w/v of *tetracycline hydrochloride RS* in the diluting solvent.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 to 10 µm),
- mobile phase: 680 ml of *0.1 M ammonium oxalate*, 270 ml of *dimethylformamide* and 50 ml of *0.2 M dibasic ammonium phosphate*, the pH of the mixture being adjusted, if necessary, to 7.6 to 7.7 with *3 M ammonia* or *3 M phosphoric acid*,
- flow rate. 2 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume. 20 µl.

The test is not valid unless the resolution between the two principal peaks in the chromatogram obtained with reference solution (b) is not less than 1.5. In the chromatogram obtained with the test solution the area of any peak corresponding to 4-epitetracycline is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) and the total area of all peaks other than the principal peak is not greater than 5.0 per cent.

Heavy metals (2.3.13). 0.5 g complies with the limit test for heavy metals, Method B (50 ppm). Use 2.5 ml of *lead standard solution (10 ppm Pb)* to prepare the standard.

Sulphated ash (2.3.18). Not more than 0.5 per cent.

Loss on drying (2.4.19). Not more than 2.0 per cent, determined on 1.0 g by drying in an oven at 60° over *phosphorus pentoxide* at a pressure not exceeding 0.7 kPa for 3 hours.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh accurately about 50 mg of the substance under examination and dissolve in about 50 ml of the diluting solvent described in the test for related substances and further add sufficient diluting solvent to produce 100.0 ml.

Reference solution (a). A 0.05 per cent w/v solution of *tetracycline hydrochloride RS* in the diluting solvent.

Reference solution (b). A solution containing 0.0025 per cent w/v of *4-epitetracycline hydrochloride RS* and 0.01 per cent w/v of *tetracycline hydrochloride RS* in the diluting solvent.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 to 10 µm),
- mobile phase: a mixture of 680 volumes of *0.1 M ammonium oxalate*, 270 volumes of *dimethylformamide* and 50 volumes of *0.2 M dibasic ammonium phosphate*, the pH of the mixture being adjusted, if necessary, to 7.6 to 7.7 with *3 M ammonia* or *3 M phosphoric acid*,
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume. 20 µl.

The test is not valid unless the resolution between the two principal peaks in the chromatogram obtained with reference solution (b) is not less than 1.5.

Calculate the content of $C_{22}H_{24}N_2O_8$, HCl.

Tetracycline Hydrochloride intended for use in the manufacture of parenteral preparations without a further appropriate procedure for removal of bacterial endotoxins complies with the following additional requirement.

Bacterial endotoxins (2.2.3). Not more than 0.5 Endotoxin Unit per mg.

Tetracycline Hydrochloride intended for use in the manufacture of parenteral preparations without a further appropriate sterilisation procedure complies with the following additional requirement.

Sterility (2.2.11). Complies with the test for sterility.

Storage. Store protected from light and moisture. If it is intended for use in the manufacture of parenteral preparations, the container should be sterile, tamper-evident and sealed so as to exclude microorganisms.

Labelling. The label states whether or not the material is intended for use in the manufacture of parenteral preparations.

Tetracycline Capsules

Tetracycline Hydrochloride Capsules

Tetracycline Capsules contain not less than 90.0 per cent and not more than 110.0 per cent of the stated amount of tetracycline hydrochloride, $C_{22}H_{24}N_2O_8$, HCl.

Usual strength. 250 mg; 500 mg.

Identification

A. In the test for Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to tetracycline hydrochloride in the chromatogram obtained with reference solution (a).

B. To a quantity of the mixed contents of 20 capsules containing about 10 mg of Tetracycline Hydrochloride, add 20 ml of warm *ethanol (95 per cent)*, allow to stand for 20 minutes, filter and evaporate the filtrate to dryness on a water-bath. To 0.5 mg of the residue add *2 ml of sulphuric acid*; a reddish violet colour develops. Add the solution to 2.5 ml of *water*; the colour changes to yellow.

C. The residue obtained in test B gives reaction A of chlorides (2.3.1).

Tests

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Shake a quantity of the mixed contents of 20 capsules containing about 25 mg of Tetracycline Hydrochloride with 80 ml of *0.01 M methanolic hydrochloric acid* for 10 minutes, dilute to 100 ml with the same solvent, mix and filter if necessary.

Reference solution (a). A 0.002 per cent w/v solution of *4-epitetracycline hydrochloride RS* in *0.01 M methanolic hydrochloric acid.*

Reference solution (b). A solution containing 0.0015 per cent w/v each of *4-epitetracycline hydrochloride RS* and *tetracycline hydrochloride RS* in *0.01 M methanolic hydrochloric acid.*

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octadecylsilane bonded to porous silica (10 µm),
- column. temperature 40°,
- mobile phase: a mixture of 5 volumes of *dimethylformamide* and 95 volumes of *0.1 M oxalic acid*, the pH of the mixture being adjusted to 3.9 with *triethylamine*,
- flow rate. 2 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume. 20 µl.

The test is not valid unless the resolution between the two principal peaks in the chromatogram obtained with reference solution (b) is not less than 2.0. In the chromatogram obtained with the test solution the area of any peak corresponding to 4-epitetracycline hydrochloride is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) and the total area of all the peaks other than the principal peak is not greater than 10.0 per cent.

Dissolution (2.5.2).

Apparatus No. 1,
Medium. 900 ml of *water* freshly prepared by distillation,
Speed and time. 75 rpm and 60 minutes.

Withdraw a suitable volume of the medium and filter through a membrane filter disc having an average pore diameter not greater than 1.0 µm, rejecting the first few ml of the filtrate. Measure the absorbance of the resulting solution, suitably diluted if necessary, at the maximum at about 276 nm (2.4.7). Calculate the content of $C_{22}H_{24}N_2O_8$, HCl in the medium from the absorbance obtained from a solution of known concentration of *tetracycline hydrochloride RS.*

D. Not less than 70 per cent of the stated amount of $C_{22}H_{24}N_2O_8$, HCl.

Loss on drying (2.4.19). Not more than 3.0 per cent, determined on 1.0 g of the contents of the capsules by drying in an oven at 60° at a pressure not exceeding 0.7 kPa for 3 hours.

Other tests. Comply with the tests stated under Capsules.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh accurately a quantity of the mixed contents of 20 capsules containing about 50 mg of Tetracycline Hydrochloride, shake with about 50 ml of *0.01 M methanolic hydrochloric acid* and dilute with the same solvent to produce 100.0 ml, mix and filter. Discard the first few ml of the filtrate.

Reference solution (a). A 0.05 per cent w/v solution of *tetracycline hydrochloride RS* in *0.01 M methanolic hydrochloric acid.*

Reference solution (b). A solution containing 0.0025 per cent w/v of *4-epitetracycline hydrochloride RS* and 0.01 per cent w/v of *tetracycline hydrochloride RS* in *0.01 M methanolic hydrochloric acid.*

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 to10 µm),
- mobile phase: a mixture of 68 volumes of *0.1 M ammonium oxalate* and 27 volumes of *dimethylformamide* and 5 volumes of *0.2 M dibasic ammonium phosphate*, the pH of the mixture being adjusted, if necessary, to 7.6 to 7.7 with *3 M ammonia* or *3 M phosphoric acid,*
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume. 20 µl.

The test is not valid unless the resolution between the two principal peaks in the chromatogram obtained with reference solution (b) is not less than 1.5.

Calculate the content of $C_{22}H_{24}N_2O_8$, HCl in the capsules.

Storage. Store protected from light and moisture.

Tetracycline Ointment

Tetracycline Hydrochloride Eye Ointment

Tetracycline Ointment contains not less than 90.0 per cent and not more than 115.0 per cent of the stated amount of tetracycline hydrochloride, $C_{22}H_{24}N_2O_8$, HCl.

Usual strengths: 0.5 per cent w/w; 1 per cent w/w.

Identification

In the test for Assay, the principal peak in the chromatogram obtained with the test solution corresponds to the peak due to tetracycline hydrochloride in the chromatogram obtained with the reference solution.

Tests

Water (2.3.43). Not more than 0.5 per cent, determined on 2.0 g dissolved in a mixture of 2 volumes of *carbon tetrachloride*, 2 volumes of *chloroform* and 1 volume of *methanol.*

Other tests. Complies with the tests stated under Eye Ointments.

Assay. Determine by liquid chromatography (2.4.14).

Test solution. Weigh accurately a quantity containing about 25 mg of Tetracycline Hydrochloride and transfer to a separating funnel with the aid of 15 ml of *cyclohexane.* Add 15 ml of a mixture of 68 volumes of *0.1 M ammonium oxalate* and 27 volumes of *dimethylformamide* (diluting solvent) and shake well. Collect the lower layer in a 50-ml volumetric flask. Repeat the extraction with two further quantities, each of 15 ml, of the diluting solvent, combining the extracts in the same 50-ml volumetric flask. Add sufficient diluting solvent to produce 50.0 ml, mix and filter.

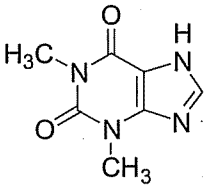
Reference solution. A 0.05 per cent w/v solution of *tetracycline hydrochloride RS* in the diluting solvent.

Chromatographic system
- a stainless steel column 25 cm × 4.6 mm, packed with octylsilane bonded to porous silica (5 to10 µm),
- mobile phase: a mixture of 68 volumes of *0.1 M ammonium oxalate* and 27 volumes of *dimethylformamide* and 5 volumes of *0.2 M dibasic ammonium phosphate*, the pH of the mixture being adjusted, if necessary, to 7.6 to 7.7 with *3 M ammonia* or *3 M phosphoric acid,*
- flow rate. 1.5 ml per minute,
- spectrophotometer set at 280 nm,
- injection volume. 20 µl.

Calculate the content of $C_{22}H_{24}N_2O_8$, HCl in the eye ointment.

Storage. Store protected from moisture.

Theophylline



$C_7H_8N_4O_2$ Mol. Wt. 180.2 (anhydrous)
$C_7H_8N_4O_2,H_2O$ Mol. Wt. 198.2 (hydrate)

Theophylline is 1,3-dimethyl-3,7-dihydro-1*H*-purine-2, 6-dione. It contains one molecule of water or is anhydrous.

Theophylline contains not less than 98.0 per cent and not more than 101.0 per cent of $C_7H_8N_4O_2$, calculated on the dried basis.

Category. Xanthine bronchodilator.

Dose. By intravenous infusion, 2.5 to 5.0 mg of anhydrous theophylline per kg body weight over a period of 20 minutes.

Description. A white, crystalline powder; odourless.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B and D may be omitted if tests A and C are carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *theophylline RS* or with the reference spectrum of theophylline.

B. Dissolve about 10 mg in 10 ml of *water*, add 0.5 ml of a 5 per cent w/v solution of *mercuric acetate* and allow to stand; a white, crystalline precipitate is produced.

C. The melting range, after drying at 105°, 270° to 274° (2.4.21).

D. Gives the reaction of xanthines (2.3.1).

Tests

Appearance of solution. Dissolve 0.5 g in 75 ml of *carbon dioxide-free water* with heating; the resulting solution (solution A), is clear (2.4.1), and colourless (2.4.1).

Acidity. To 50 ml of solution A add 0.1 ml of *methyl red solution*. The solution is red and not more than 1.0 ml of *0.01 M sodium hydroxide* is required to change the colour of the solution to yellow.

Light absorption (2.4.7). Absorbance of a 0.001 per cent w/v solution in *0.1 M hydrochloric acid* at the maximum at about 270 nm, not less than 0.53.

Related substances. Determine by liquid chromatography (2.4.14).

Test solution. Dissolve 40 mg of the substance under examination in 20.0 ml of the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 10 mg of *theobromine* in the mobile phase, add 5 ml of the test solution and dilute to 100 ml with the mobile phase. Dilute 5 ml of this solution to 50.0 ml with the mobile phase.

Chromatographic system
- a stainless steel column 25 cm x 4 mm, packed with octadecylsilane bonded to porous silica (7 µm),
- mobile phase: a mixture of 7 volumes of *acetonitrile* and 93 volumes of 0.14 per cent w/v solution of *sodium acetate* containing 0.5 per cent v/v solution of *glacial acetic acid,*
- flow rate. 2 ml per minute,
- spectrophotometer set at 272 nm,
- injection volume. 20 µl.

Inject reference solution (b). The test is not valid unless the resolution between the peaks due to theobromine and theophylline is not less than 2.0. The relative retention time with reference to theophylline for theophylline impurity C is about 0.3, for theophylline impurity B is about 0.4, for theophylline impurity D is about 0.5 and for theophylline impurity A is about 2.5.

Inject the test solution and reference solution (a). Run the chromatogram 3.5 times the retention time of the principal peak. In the chromatogram obtained with the test solution, the area of any secondary peak is not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent). The sum of all the secondary peaks is not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent) Ignore any peak with an area less than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.3.13).1.0 g complies with the limit test for heavy metals, Method B (20 ppm).

Sulphated ash (2.3.18). Not more than 0.1 per cent.

Loss on drying (2.4.19). Not more than 0.5 per cent (for the anhydrous form) and 8.0 per cent to 9.5 per cent (for the hydrated form), determined on 1.0 g by drying in an oven at 105°.

Assay. Weigh accurately about 0.25 g, add 50 ml of *water* and gently warm the mixture on a water-bath until complete solution is effected. Cool, add 20.0 ml of *0.1 M silver nitrate* and 1.0 ml of *bromothymol solution* and titrate with *0.1 M sodium hydroxide* until a blue colour is obtained.

1 ml of *0.1 M sodium hydroxide* is equivalent to 0.01802 g of $C_7H_8N_4O_2$.

Storage. Store protected from moisture.

Theophylline Injection

Theophylline in Dextrose Injection

Theophylline Injection is a sterile solution of Theophylline and Dextrose in Water for Injections.

Theophylline Injection contains not less than 92.5 per cent and not more than 107.5 per cent of the stated amount of anhydrous theophylline, $C_7H_8N_4O_2$, and not less than 95.0 per cent and not more than 105.0 per cent of the stated amount of dextrose, $C_6H_{12}O_6$, H_2O.

Usual strengths. Anhydrous theophylline, 0.4, 0.8, 1.6, 2, 3.2, 4 mg per ml in 5 per cent w/v Dextrose.

Identification

A. When examined in the range 230 nm to 360 nm (2.4.7), the solution obtained in the Assay for theophylline shows an absorption maximum at about 274 nm.

B. Add 0.2 ml of the injection to 5 ml of *potassium cupri-tartrate solution* and heat to boiling; a red to orange precipitate is formed.

Tests

pH (2.4.24). 3.5 to 6.5.

5-Hydroxymethylfurfural and Related substances. Use a glass chromatographic column (66 cm x 11 mm) with a sealed-in, coarse-porosity sintered disc or a glass wool plug and fitted with a stopcock. Mix 8 g of a 20- to 50-mesh styrenedivinyl-benzene anion-exchange resin in the hydroxide form with 25 ml of *water*, allow to settle and decant the supernatant liquid until a slurry of resin remains. Pour the slurry into the column and allow to settle as a homogeneous bed having a bed volume of about 15 ml. Wash the resin bed at a flow rate of about 3 ml per minute with 100 ml of a 5.7 per cent w/v solution of *ammonium carbonate* followed by washing with *water* until the eluate has a pH of 7.

Dilute an accurately measured volume of the injection containing 1.0 g of Dextrose, $C_6H_{12}O_6,H_2O$, to 250.0 ml with *water*. Pass this solution through the resin bed in the column at a flow rate of about 3.5 ml per minute, discarding the first 50 ml of the eluate. Measure the absorbance of the eluate at 284 nm, using *water* as the blank; the absorbance is not more than 0.25 (2.4.7).

Other tests. Complies with the tests stated under Parenteral Preparations (Injections).

Assay. *For theophylline* — Dilute a suitable volume of the injection with sufficient *0.1 M sodium hydroxide* to produce a solution containing 0.008 per cent w/v of anhydrous theophylline. Measure the absorbance of the resulting solution at the maximum at about 274 nm (2.4.7), using as the blank a solution prepared in the same manner omitting the substance under examination.

Calculate the content of $C_7H_8N_4O_2$ from the absorbance obtained by repeating the operation using *theophylline RS* in place of the substance under examination.

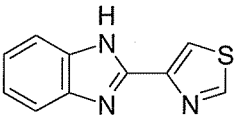
For dextrose — Transfer an accurately measured volume of the injection containing about 5 mg of Dextrose to a 100-ml volumetric flask, add 0.2 ml of *6 M ammonia*, dilute to volume with *water* and mix. Determine the optical rotation of the resulting solution in a suitable polarimeter tube at 25° (2.4.22). The observed rotation, in degrees multiplied by 1.0425*A*, represents the weight, in g, of $C_6H_{12}O_6,H_2O$ in the volume of the injection taken for the assay, where *A* is the ratio 200 divided by the length, in mm, of the polarimeter tube employed.

Storage. Store protected from light, in single dose containers.

Labelling. The label states the strength in terms of the amounts of anhydrous theophylline and Dextrose.

Thiabendazole

Tiabendazole



$C_{10}H_7N_3S$ Mol. Wt. 201.3

Thiabendazole is 2-(1,3-thiazol-4-yl)-1*H*-benzimidazole.

Thiabendazole contains not less than 98.0 per cent and not more than 101.0 per cent of $C_{10}H_7N_3S$, calculated on the anhydrous basis.

Category. Anthelmintic.

Dose. In the treatment of nematode infestation, 1.5 g twice daily for three days.

Description. A white or almost white, crystalline powder.

Identification

Test A may be omitted if tests B, C and D are carried out. Tests B, C and D may be omitted if test A is carried out.

A. Determine by infrared absorption spectrophotometry (2.4.6). Compare the spectrum with that obtained with *thiabendazole RS* or with the reference spectrum of thiabendazole.

B. When examined in the range 230 nm to 360 nm (2.4.7), a 0.0005 per cent w/v solution in *0.1 M hydrochloric acid* shows absorption maxima at about 243 nm and 302 nm; ratio of the absorbance at the maximum at about 302 nm to that at about 243 nm, 1.8 to 2.1.

C. In the test for Related substances, the principal spot in the chromatogram obtained with the test solution (b) corresponds to that in the chromatogram obtained with reference solution (c).

D. Dissolve 5 mg in 5 ml of *0.1 M hydrochloric acid*, add 3 mg of *4-phenylenediamine dihydrochloride* and shake until dissolved. Add 0.1 g of *zinc powder*, mix, allow to stand for 2 minutes and add 10 ml of *ferric ammonium sulphate solution*; a deep blue or bluish violet colour is produced.

Tests

Appearance of solution. Add 5 ml of *methanol* to 0.5 g in a flask fitted with a ground-glass stopper, stir for 5 minutes, with a magnetic stirrer and filter through a sintered-glass filter (1.6 µm to 4 µm). The solution is not more intensely coloured than reference solution BS6 (2.4.1).

Related substances. Determine by thin-layer chromatography (2.4.17), coating the plate with *silica gel HF254*.

Mobile phase. A mixture of 62.5 volumes of *toluene*, 25 volumes of *glacial acetic acid*, 10 volumes of *acetone* and 2.5 volumes of *water*.

Test solution (a). Dissolve 0.1 g of the substance under examination in 10 ml of *methanol*.

Test solution (b). Dilute 2 ml of test solution (a) to 20 ml with *methanol*.

Reference solution (a). Dilute 1 ml of test solution (b) to 10 ml with *methanol*.

Reference solution (b). Dilute 1 ml of test solution (b) to 25 ml with *methanol*.

Reference solution (c). Dissolve 20 mg of *thiabendazole RS* in 20 ml of *methanol*.
